The mining market this week, like that of last, presents no features of an interesting character. The dealings have been mostly confined to a few low-priced stocks, which have no real value and which would be dear at any price. The general market has been weak, and closed to-day with a tendency to a still further decline.

Of some of the more prominent stocks dealt in, Robinson was weak throughout and to-day sold at its lowest price, 78c., closing at that figure. Sierra Grande has been irregular during the week closing weak to-day. Elko Consolidated has been manipulated up to a strong figure, the transactions being very large. Lacrosse has been very active within the last three days, and sold at strong prices. Sonora Consolidated was actively dealt in, but declined and closed weak. The aggregate number of mining shares dealt in at all the Exchanges was 456,790, as against 416,443 last week.

The Comstock shares have been very quiet and irregular. California was a little weak, selling from 11@9c., with a business of 3000 shares. Consolidated Virginia records a small business at weak prices, selling from 53@49c. Sierra Nevada was very quiet at $2.65. Union Consolidated, under small transactions, was quite strong; it sold from $4.95@$4.55@$5. Mexican developed a little strength, with a small business, and sold from $3.15@$2.75@$4. Ophir sold at $3.25, with a small business. Yellow Jacket was quiet and steady, selling at $1.63@$1.50. Best & Belcher was very quiet and sold at $4. Sutro Tunnel was quiet and irregular; it sold from 22@18@21c., with a business of 4650 shares.

The Leadville stocks record small transactions, and were generally irregular. Amie was active and irregular, selling from 26@31@22c. Chrysolite was also irregular, under a small business, and sold from $1.30@$1.45@$1.35. Dunkin was dealt in to the extent of 1300 shares, at 25@20@23c. Breece sold at 22c. Iron Silver records a small business at irregular prices, selling from $3@$2.90@$2.95. Leadville had a fair business at strong prices; it sold from 69@75@72c. Little Chief was very quiet at 38c. Little Pittsburg was quiet and strong, selling from 58@64c., with a business of 650 shares. Big Pittsburg sold at 19@20c., and Climax at 10@9c.

The Bodie stocks were quiet and steady. Bodie Consolidated was very irregular, selling from $1@75@85c. under a business of 1140 shares. Bulwer was quiet and steady, selling from 91@98c. Standard, with a small business, was very irregular, selling from $6.50@$7.25@7@$6.50.

The Tuscarora stocks were quiet and steady. Grand Prize sold at 50c. throughout the week. Argenta was quoted at 42c. with one transaction. Navajo had a small business, and was a little weak; it sold from $4@$3.35@$3.40. North Belle Isle records a moderate business at weak prices, selling from 50@43c. Independence sold at 50c. Elko Consolidated was very active and developed considerable strength; it sold from 7c.@18c., with a business of 61,700 shares.

In the miscellaneous list, Alice was quiet and irregular, selling from $3.05@$2.80@$2.90. Bassick was quiet and strong, selling from $9.50@$10. The Green Mountain stocks were almost neglected. Green Mountain was strong at 65@78c., and Rising Sun sold at 5@4c. Horn-Silver records small transactions at strong prices; it was dealt in to the extent of 695 shares at $7.50@$8. Ontario was quiet and strong, selling from $28@$25@$24. Robinson Consolidated had an active business at very irregular prices throughout, closing quite weak to-day; it sold from 90@78c. Sierra Grande was active and has been weak, selling from $2.90@$2.75, with a business of 9800 shares. Silver King, under a small business, suffered a decline, selling from $11.25@$10.50.

Bradshaw was quiet and steady, selling at 31c. Central Arizona records but one transaction, and that at 35c. Decatur had a very active business at irregular prices; it sold from 7@5@6c. Durango, under a moderate business, was irregular, selling at 10@8@9c. Eastern Oregon had a fair business, and was weak; it sold from $1@75c. Harlem M. & M. Co. has grown stronger, with a good business, selling from $1.25@$1.35, the transactions amounting to 8100 shares. Lacrosse records a very active business, and has been strong; it sold from 11@18c. Oriental & Miller was quiet and steady at 14@15c. Red Elephant sold at 6@5c., with a business of 600 shares. Silver Cliff was quiet and steady, selling at 39@40c. Sonora Consolidated had an active business at very irregular prices; it sold from 48@52@44c. South Pacific was actively dealt in and was strong, selling from 5@8c. The State Line stocks were quiet and steady; Nos. 1 and 4 sold at 3c. and Nos. 2 and 3 at 6c. Taylor-Plumas records an active business at steady prices, selling at 18@17c.

The local Montana papers speak very discouragingly of the Alta-Montana. It appears that the works have been closed down, and the product has considerably fallen off. The offices of the company in this city have been apparently given up, and no information can be obtained as to its present headquarters.

MEETINGS.

Electro Metal Refining Company, No. 41 Liberty street, New York City. Annual meeting of stockholders for the purpose of reducing the capital stock to one hundred thousand dollars, April 4th, at twelve o'clock M.

Resolute Mining Company, office of Mr. H. Hoffman, No. 629 Walnut street, Room 7, Philadelphia, Pa. Annual meeting of stockholders and election of trustees, April 2d, at twelve o'clock M.

DIVIDENDS.

The Carbonate Hill Mining Company, of Colorado, has declared dividend No. 3, of 5 cents per share, payable April 2d. Transfer-books close March 20th, and reopen April 2d.

The Homestake Mining Company, of Dakota, has declared its fifty-fifth dividend, for February, of $50,000, payable at the office of the transfer-agents, Lounsbery & Haggin, March 26th. Transfers close March 20th. Total amount of dividends paid to date $1,912,500.

The Oxford Gold Mining Company, of Nova Scotia, has declared a dividend of 5 per cent on the capital stock, payable March 17th. Books closed on the 13th, and reopen on the 19th.

The Silver King Mining Company, of Arizona, has declared a dividend of 25 cents per share.

The Smuggler Mining Company, of Colorado, has declared a dividend, No. 5, of 10 cents per share, or $6000 on its capital stock.

The Northern Belle Mining Company, of Nevada, has declared a dividend of 50 cents per share.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, No. 55 Broadway, report as follows for the week ended Friday, March 16th:

One week ago to-day, petroleum opened 88 bid, and after selling down to 86c. closed 89¼c. On the following day, prices opened 88⅝c. and closed 93¼c. On Monday, the 12th, the market opened up 95½c., or 2 cents per barrel above Saturday's closing, and with great excitement and heavy trading prices advanced to $1.00⅝ at the close. The following day, prices opened at $1.02, or nearly 2 cents above the closing of the night before. Since Tuesday, prices have fluctuated between 97½c. and $1.01, and at one P.M. to-day (Friday) were 99⅜c. The immediate cause of the advance was the rapid decline of the new wells which had been opened up on the Cooper tract, and the "running to cover" of the short interest, which was quite large.

The total production of the Cooper tract two weeks ago was 1700 barrels daily. About one week ago, it rose to 3100, but since Sunday of this week the production has fallen off 1300 barrels, and is now about 1850 daily. The spotted character of the Cooper tract would seem to preclude any heavy or continued production, and if oil is to become a glut in the market, it will come from some other region. The Sherman well is expected on soon, and as it will define the extent northward of the Cooper tract, its showing is important.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
March 10.....	$0.88⅞	$0.92⅞	$0.88	$0.92⅞	714,000
12.....	.95⅛	1.00½	.94⅝	1.00	1,052,000

14.....	.99	1.00¼	.97½	.98⅝	841,000
15.....	.98	.99½	.98	.98¾	345,000
16.....	.99¾	1.01½	.97½	1.01¼	808,000
Total sales.....					4,532,000

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been quiet and featureless. There is no change of interest in the Comstock shares, they remaining quiet and steady. The outside stocks record but a small business, and have been firm.

An assessment of twenty-five cents per share has been levied by the Tip Top Silver Mining Company, payable immediately, and delinquent April 16th.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, March 15.

There is a slightly improved feeling in the market for copper stocks, and prices show a small advance over the closing rates of last week. At the same time, the market is extremely dull, and orders to buy or sell are few and far between. There seems to be an entire absence of speculative feeling, and business is confined to the few stocks which are paying or are expected to pay dividends in the near future. Calumet & Hecla declined from $235@$233, but subsequently recovered and sold up to $236; the product of the mine for February (24 days) was 1454 tons. Franklin declined to $11½, with later sales at $12; the product for February was 151 tons. The annual report for 1882 shows a surplus of $244,330.37, January 1st, 1883, against $116,842.65, January 1st, 1882; but as the surplus consists largely in copper and supplies, the question of a dividend is still unsettled, although at the annual meeting the subject will probably be considered. Pewabic dull and declined from $7 to $6

The February product of this mine was 69 ton

Quincy declined from $47@46¼ in the early dealings but rallied and sold at $48½, closing $48 bid. The February product was 175 tons. An official letter from the mine confirms what has been known privately namely, that the very rich 50-foot deposit of ore encountered on the 250-fathom level extends all the way down to the 290 and 300-fathom level. The outlook of the mine is every way favorable. Osceola sold at $80½@$81, with a sale of 100 shares at $29½

seller 30; later the stock sold at $30, ex dividend $1 per share. A small sale of Atlantic is reported at $13, a decline of $1 per share from last sale. Allouez declined from $2½@$1½, with later sales at $2.

The market for silver stocks continues dull and featureless. Bonanza sold at $2½; Catalpa declined from 60@52½c., with later sales at 60c., which was bid. Crescent declined to 25c. Harshaw sold up ⅛, at 87½c. San Pedro, steady at 60@67½c. Silver Islet declined from $5@$4, at which it was offered. Another assessment of $1 per share is rumored. Sullivan sold at $15-16; Napa Quicksilver, at $3¼.

At the Boston Mining Exchange, the usual amount of business has been transacted, but without any special feature. Massachusetts & New Mexico continues to decline under persistent selling, touching 8c., seller 60, to-day assessment 5c. paid. Empire dull, at 20c. bid. Brunswick Berth declined to 47½c., seller 30, but this afternoon advanced to 57½c. regular.

3 P.M.—The market this afternoon was dull and void of interest. Franklin sold at $12. Pewabic declined to $6½. Closing prices: Allouez, $2 bid. Bonanza, $2½ bid, $2¾ asked. Calumet & Hecla, $236 bid, $242 asked. San Pedro, 65c. bid, 67½c. asked. Catalpa, 62½c. bid, 65c. asked. Pewabic, $6½ asked. Quincy, $48½ asked. Huron, $1¾ asked. Harshaw, 75c. bid, $1 asked. Sullivan, 87½c. bid.

BULLION MARKET.

NEW YORK, Friday Evening, March 16.

Owing mainly to the extreme stringency of our money market, sterling exchange has materially declined since our last issue, and has caused a corresponding fall in the price of silver, as shown in accompanying table of rates for the week.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
March 10..	51⅛	110⅞	March 14	51 3-16	111
12..	51 3-16	*	15..	51 3-16	110⅞
13..	51 3-16	111	16.	51 3-16	†

* 111@111⅛ †110¾@110⅞.

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13⅛ per cent. to arrive at actual value.

MINES.	States.	For the week.	Month of February.	Year from Jan. 1st, 1883.
Alice, G. S.	Mont.		$73,864	$163,905

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended March 16th, as compiled from various sources, amounted to $348,929.75, as against $258,298.41 reported for the previous week. The receipts from January 1st, 1883, to date are $3,250,729.27.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended March 10th	$423,568
Corresponding week last year	940,408
Since January 1st, 1883	2,460,350
Corresponding period last year	12,234,748

Imports.

Week ended March 10th	$250,638
Corresponding week last year	54,757
Since January 1st, 1883	1,377,806
Corresponding period last year	700,012

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 3 per cent. During the week, the bank lost £260,000 bullion, and its proportion of reserve to liabilities was reduced from 43 to 42 3/16 per cent, against 42 7/16 per cent at this date last year. The weekly statement of the Bank of France has not been received.

METALS.

NEW YORK, Friday Evening, March 16.

Copper.—The market has been quiet but unchanged, the only feature of special interest being the beginning of an export movement of Lake copper, about 2,750,000 pounds having been contracted for at a price reported to be 16c. Whether this is to be the beginning of any movement of magnitude remains to be seen, but there is every reason to believe that small lots at least will follow. It will certainly, if developed into greater proportions, accomplish one thing which is very important, namely, restore harmony in the ranks of the Lake producers, who, it is whispered, were beginning to get a little restive. We are far from taking the gloomy view of the future of the metal which others appear to delight in. It may be frankly acknowledged that the production is heavy, and we claim to have done much toward showing what it really is; but we can not, taking all the points into consideration, indorse the opinion, persistently though quietly expressed, that we are driving toward the export point at a rapid rate. The very fact that we shall probably export copper materials heavily, and besides send out some Lake copper, will keep us fairly steady. A very large and probably the most influential class of consumers asks nothing else but that the price of the raw material be kept steady, no matter what it is. It is true there is another class which claims that all it wants is low raw material in order to "beat creation" in manufactured brass. We suspect that there is considerable exaggeration about this; but if it could be shown to be the case, we have no doubt that leading producers would accommodate them by doing, as, in the time of the export of cartridges, they placed them in a position to compete.

There is one very important point that the enthusiastic bears in copper seem to utterly forget. Many enterprises, notably in Arizona and New Mexico, were started a year ago when copper was 17 or 18 cents. Now the selling price of many of these outside brands is 15½ cents, from which must be deducted the cost of refining, interest on loans, cost of transportation, etc. With labor high, coke at $60@$70 per ton, and development-work on hand, it requires ore of very high grade indeed to pay for working, and there are, to our knowledge, a number of enterprises auspiciously begun that have at present prices no brilliant future before them.

We quote Lake Copper nominally 17⅝@17¾c., though any attempt to force sales would make it difficult to realize more than 17½c. Baltimore is nominally quoted at 16c., and outside brands 15½c. England cables Chili Bars £65 10s.@£65 15s., and Best Selected £71 15s.@£72 5s.

Tin.—There has been considerable excitement in this metal, due principally to favorable advices from Singapore and London, the quotation in the latter market having been forced up to £96 15s. to-day. Transactions here foot up to 700 or 800 tons at steadily advancing prices, spot Straits being now quoted 20¾@20⅞c.

Lead.—The market here has relapsed into absolute stagnation. The best bids obtainable are 4·65c., while holders profess to be firm at 4·70, though we hear that 4·67½c. would be met. There has not been a single wholesale transaction in the market during the entire week, and we quote nominally 4·67½@4·70c. for Common, and 4·70c. for Refined.

From St. Louis, Messrs. John Wahl & Co. wire us as follows to-day:

Our market is firm. Sales for the week sum up over 90 tons of Hard lead at 4·25c. and 80 tons of Refined at 4·27½c., and 170 tons at 4·30c. Receipts were 850 tons, against 550 tons last week.

Spelter.—We are unable to note much change, although in itself this metal is very much better situated than any other largely produced in this country. We quote 4⅝@4¾c. for Domestic.

Antimony.—There has been no change worthy of mention.

Quicksilver.—The present spot price is $28.50 per flask for A, and 37@37½c. for other brands. The London price has dropped £5 15s. Here to 36½@37c.—*San Francisco Commercial Herald.*

IRON MARKET REVIEW.

NEW YORK, Friday Evening, March 16.

The British Iron and Steel Association has just published the following statistics, collected by Mr. J. S. Jeans, secretary, the unit being the gross ton:

PRODUCTION OF BESSEMER STEEL INGOTS.

District.	1881.	1882.	Increase.
South Wales	384,656	483,086	98,430
Sheffield	392,812	420,000	27,188
Cleveland	264,986	326,924	61,938
Lancashire	227,465	239,983	12,518
West Cumberland	162,775	191,326	28,551
Staffordshire	9,025	12,330	3,305
Total	1,441,719	1,673,649	231,930

The make of rails was as follows:

PRODUCTION OF BESSEMER STEEL RAILS.

District.	1881	1882.	Increase.
South Wales	305,043	367,944	62,901
Sheffield	245,469	310,000	64,531
Cleveland	216,004	265,842	49,838
Lancashire	135,543	140,708	5,165
West Cumberland	121,093	150,693	29,600
Staffordshire	588	598	10
Total	1,023,740	1,235,785	212,045

The number of Bessemer steel-works in operation in the United Kingdom during 1882 was the same as in the preceding year, namely, 23; one new works having begun to manufacture steel for the first time in that year, while another company discontinued the manufacture altogether. The number of converters in work during the year was 80, or two less than in 1881, while 24 were inoperative—three less than in 1881; and 10—or four less than in 1881—were in course of construction.

There has been a considerable improvement in the average productiveness of the converters at work in 1882, as compared with any preceding year, as the following figures show:

Year.	Average annual yield per converter. Tons.
1879	12,641
1880	13,125
1881	17,582
1882	20,920

But while the converters in work have averaged 3338 tons per converter more than in 1881, there is a large amount of variation in the yields obtained in the different districts, the averages of which have been as under:

District.	Number of converters at work.	Total production of ingots. Tons.	Average per converter. Tons
South Wales	19	483,086	25,425·58
Sheffield	26	420,000	16,153·84
Cleveland	12	326,924	27,243·66
Lancashire	14	239,983	17,141·64
West Cumberland	7	191,326	27,332·28
Staffordshire	2	12,330	6,165·00

The best result obtained at individual works was 78,202 tons with two converters—an average of 39,101 tons per converter; while at another works the average yield per converter amounted to 31,178 tons per converter. The former is believed to be the best "record" that has yet been made in the United Kingdom in Bessemer practice. With such excellent practice throughout the country, the work done last year by eighty converters might be accomplished by forty-six.

The total quantity of Bessemer steel plates manufactured in the United Kingdom during 1882 was 33,500 tons, against 21,989 tons in 1881, and 21,500 tons in 1880. Of the 23 works engaged in producing steel of this description, nine turned out in 1882 quantities of plates varying from 14 to over 10,000 tons.

As in the preceding year, a large trade was done in blooms during 1882, chiefly on American account. The total quantity produced was over 130,000 tons.

The following table gives the production of open-

hearth steel in each district of the United Kingdom during each of the last two years, with amount of increase in the latter year :

PRODUCTION OF OPEN-HEARTH STEEL.

District.	Production. 1881. Tons.	1882. Tons.	Increase.+ Decrease.— 1882. Tons.
Scotland	102,000	213,000	+111,000
South Wales	159,500	129,500	— 30,000
Sheffield	34,000	42,000	+ 8,000
Northwest Coast	24.000	17,000	— 7,000
Northeast Coast	12,200	6,000	— 6,200
Other districts	6,300	28,500	+ 22,200
Total	338,000	436,000	+ 98,000

The number of open-hearth furnaces erected in the United Kingdom at the end of each of the last three years has been :

At the end of 1880	120 furnaces.
" 1881	149 "
" 1882	163 "

The average annual production of the open-hearth furnaces actually at work in the United Kingdom during each of the last three years has been—

In 1880	2,540 tons.
" 1881	2,925 "
" 1882	3,114 "

American Pig.—The demand thus far has been a disappointment, buyers not coming forward with any alacrity to secure the season contracts, which are ordinarily pretty well closed by this time. It is conceded quite generally by producers that there is nothing to warrant the expectation of an advance, while consumers appear to argue that possibly the bottom has not yet been touched. We note sales for season delivery of about 4000 tons, an unimportant amount. We quote $23@$25 for ordinary to choice No. 1 Foundry, $21.50@$22.50 for No. 2, and $19@$20.50 for Gray Forge. Bessemer pig is quiet and dull, nominally at $21.50@$22.50, with prices slightly declining abroad. In spiegeleisen, we note sales of about 500 tons here at $32 for 20 per cent, and $27 for 10@12 per cent.

Scotch Pig.—Business drags along, although Scotch Foundry irons range considerably lower than American. Arrivals for the week foot up to 2200 @ 2300 tons, little of which has gone into store. Freights are again very low, 5s. from Glasgow to New York. We quote Coltness, $24.25@$24.50; Langloan, $24.25, 100 tons having been sold at that figure; Summerlee, $23.50@$24; Glengarnock, $22@$22.50; and Eglinton, $21@$21.50. At the Wall Street Exchange, the following cable quotations have been received, showing little change : Carnbroe, 55s. 3d.; Gartsherrie, 62s.: Summerlee, 62s. 3d.; Coltness, 64s. 9d.; Langloan, 65s.; Glengarnock, 55s. 3d.; and Eglinton, 49s. 6d.; warrants were 47s. 5d.

Rails.—Transactions footing up to about 8000 tons have been closed during the week at $39@$40 at mill, and we hear of the sale of 20,000 tons at Western mills at private terms. England is unchanged.

Old Rails.—We have been unable to verify the reports of transactions at low figures, evidently made for effect. The only sale of any magnitude has been 700 tons at $24 at Jersey City, and since then nothing has been done, although other business is pending. In Ohio, $25@$26 is asked; and at Pittsburg, $26½, which is below quotations here. There are inquiries in the market for D. Hs. at $26.75@$27, but holders decline to part with their old material below $28 net. Bridges are held at $28.25.

Scrap.—Business is restricted, and transactions few and far between. We quote $25 asked, ex ship.

Philadelphia. March 16.

The iron trade has developed no more strength than it had last week, and the sentiment among manufacturers and brokers is, that present prices are likely to continue a week or two longer.

Pig-Iron.—Between four and five thousand tons of Foundry and Forge iron have been sold during the week, mostly in 50 to 200-ton lots. Some furnace companies have been making offers of larger lots in 500 to 1000 tons, but buyers are not willing to take hold unless greater concessions can be made than makers are willing to concede. Quotations show a wider variation, but the concessions are mostly in inferior irons. The standards are maintaining their hold very well, and are selling at $25@$25.50 for No. 1, delivered; $22@$23 for No. 2. Gray Forge is quoted at $18@$19, at furnace, with some of the better brands fifty cents to one dollar higher. In the present situation of the market, consumers can not be induced to take hold very freely. Scotch iron is moving with a little more freedom in small lots among the foundries, and those who have been endeavoring to sell report the demand sluggish, prices running from $21.50@$26, and are a little weaker than heretofore. Bessemer iron is quoted at $22.50. Two or three inquiries for large lots are in the market, but terms can not be arrived at. Charcoal blooms are $64, and capacity is fairly engaged. Anthracite, $55.

Merchant Bar.—The demand for Merchant Bar is too irregular and too light to justify manufacturers in closing large contracts. A few days may change the entire aspect of affairs, and drive buyers into the market.

The merchant iron trade lacks its usual interest. Consumers decline to present any but small orders, and manufacturers are not able to attract consumers into the market except at impossible concessions. The interior mills are selling ordinary iron at about from 2@2·15c, and are not doing a very large business even at that. Refined iron has sold down as low as 2·15c. and as high as 2.30c., according to size of order. Orders could be placed to advantage at this time with little difficulty, but buyers are not easily convinced that it is to their interest to buy more than is needed for current requirements.

Nails.—The nail trade is in a more uncertain position than last week. The Western Association met on Wednesday, and made a gloomy report, reaffirming card rates, and advising continued alternate restriction. The capacity is admitted to be in excess of demand, and this policy will, it is thought, be necessary throughout the year, although this opinion is not unanimous. The Atlantic Nail Association, which held its meeting in New York yesterday, took, substantially, the same grounds, but the actual selling price of nails runs from $3.10 to $3.30, according to competition. The factories are accumulating stocks slowly; and in view of the possibilities of greater weakness, some of the larger consumers are placing orders for small lots. The trade finds itself in a very different position from that of a year ago.

Structural Iron is quoted at 2½c. for Angles : 3¼c. for Tees ; 3½c. for Beams and Channels. The business reported received this week is mostly in small orders, although there are some large specifications in sight which will probably lead to heavy transactions.

Plate and Tank.—Manufacturers of plate and tank report a favorable condition of trade and a fair supply of orders at slight concessions from card rates, which are 3½c. for Tank ; 3½c. for Shell ; 4½c. for Flange. As the spring season approaches, requirements are presented which indicate that the activity of the coming season will not fall behind that of last, although buyers are more exact as to terms.

Sheet-Iron.—Sheet-iron manufacturers are doing only a moderate business, at 4@4½c. for small orders, and are seeking large orders at sharp concessions. The uncertainty as to the spring demand is keeping prices favorable to buyers, and they are taking advantage of it.

Wrought Pipes and tubes are 67½ to 70 off for pipes to 55 for tubes. No large orders have been placed, although there is large business in sight. The hardware houses are shipping large quantities of goods this week, and the favorable weather promises an improving activity.

Steel Rails.—Quotations in small lots are reported at $39, and it is stated that $38 may be shaded for large lots, but makers decline to state lowest prices, except on inquiries from purchasers.

English Tees are dull at $25@$25.50. Inquiry has been made for Double-Heads and $27@$27.50 has been named, but no transactions have been closed as yet. Scrap sold at $25@$26 for inferior yard lots. Selected lots are moving freely at abont $27@$27.50, and in occasional instances $28.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, March 16.

Anthracite.

The companies have yielded to the pressure which urged full-time work, and so far as the employés in the coal regions are concerned, this move will be considered fortunate. It is not, however, so far as we have been able to gather from a careful inquiry, consistent with the promise of keeping demand and supply close together. There has not, during the past few weeks, been the slightest scarcity of coal, nor any immediate prospect of a rush in the demand. On the contrary, buyers are as conservative as ever.

Conferences between the coal companies have taken place in regard to opening prices, but as yet nothing has been done, nor is it likely that any thing will be done until the Pennsylvania Coal Company has had its say. It will go up to Newburg next week—is in fact now preparing to do so—and its circular will then be announced, followed, probably at an early date, by all the other and larger companies. The Western shippers have adjourned to the 28th inst.

Bituminous.

The period of uncertainty and to many of anxiety still continues. No one seems to know exactly where his neighbors are standing, and there is no end to the "suspicions" indulged in. So much, however, seems certain, that the Clearfield operators find the Pennsylvania Railroad intractable, while producers generally are unable to make buyers stir even by tempting offers, which it appears can only be made by many by gambling on freights.

Occasional lots of coal forced on the market are selling at a low figure. We have heard of $4.25, and quote the market for Clearfield $4.40@$4.65; and for Cumberland, $4.45@$4.75.

Those shippers engaged largely in supplying the foreign steamers with coal are considerably agitated over the prospective damage which the following clause in the new tariff will inflict upon them :

"A drawback of 75 cents per ton shall be allowed on all bituminous coal imported into the United States which is *a fterward used for fuel on board of vessels propelled by steam which are engaged* in the coasting trade of the United States *or in the trade with foreign countries*."

This will allow of the building up of a trade of Nova Scotia and English coals brought in at a low cost and supplied to steamers during the active season at a lower figure than American coals can be sold.

SUPPLIES.

Prices of Cordage.

The following new prices of cordage were adopted on the 13th inst. The prices of Manila are reduced ½ cent per pound, and those of Sisal advanced an equal amount. These prices are subject to the usual discount to the trade of 1 per cent per pound :

	Cents per pound.
MANILA ROPE.	
1¼ inch circumference and upward	16
12 thread, or ⅜ inch diameter	16½
6 and 9 thread, or ¼ and 5-16 diameter	17
Hay rope, 2, 3, 4, or 5 thread	16
Bolt and point rope	17½
Tarred rope and lath yarn	15½
Stave, leather, and hop twine	16½
SISAL ROPE.	
1¼-inch circumference and upward	11¼
12 thread, or ⅜-inch diameter	12
6 and 9 thread, or ¼ and 5-16 diameter	12½
Hay rope, 2, 3, 4, or 5 thread	11½
Tarred rope and lath-yarn	11
RUSSIA HEMP.

ON Thursday, the conference committees of the two iron and metal exchanges in this city agreed on a plan for their consolidation. As yet, their formal report has not been made, and the details of the arrangement arrived at are not known.

IT is reported that Messrs. CARNEGIE Brothers, the Pittsburg steel and iron manufacturers, have made an agreement with the Ontario Central Railroad, and other parties interested, to carry out prospect-work on two iron ore deposits at Wallaston, Ontario. The CARNEGIES have paid $5000 cash, and are allowed to make explorations with the diamond drill, with the option of buying one mine for $700,000, and the other for $100,000, figures which seem very high.

MR. HENRY G. PEARSON, Post-Master, announces that, under arrangements recently made, letters directed to this city are separated in transit, and those on which the box-number forms part of the address are placed in separate packages, so that time in distributing them is saved. In order to secure proper attention, and in many instances enable us to save a week in publication, we would beg our correspondents to address, in the future, all letters to our Post-Office Box, **1833.**

* WE regret to announce the sudden death, at San Luis Potosi, Mexico, of Mr. FRANCIS A. LOWE, a frequent and valued contributor to the pages of the ENGINEERING AND MINING JOURNAL. Mr. LOWE was a graduate of the Sheffield Scientific School, and completed his education as a mining engineer and metallurgist at Freiberg. He was for years at Silver Islet, Lake Superior, and later at Batopilas, Mexico. He died at the age of thirty-seven, when on a professional trip, at a time when his accumulated experience was beginning to open out to him a promising career.

SWANSEA, too, is invaded by the corporation craze, two of the smelters of that great metallurgical center passing out of the hands of a private firm into those of a company. VIVIAN'S nickel and copper works, with the Norway mines, were capitalized at £320,000 some weeks since; and now the spelter works of Messrs. RICHARDSON & Co., with mines at Bergamo, Italy, follow with a capital of £105,000. Have Swansea smelters been getting too rich, or do they imitate the way of many of our Western operators, of "getting out" at the first intimation of hard times ahead?

A SIGNIFICANT statement was recently made at a meeting in London of the La Plata Mining Company, of Leadville, which does a considerable share of the smelting of ores in that district. The chairman reported that during the last three months the company has been losing 10 shillings, or nearly $2.50, per ton, a result that is attributed to mismanagement. It is well known that at least one of the smelters, conducted by a gentleman of great experience, is working at very low figures, the cost being rumored to be below $7 per ton. The management professes to have assurances that there is not any discrimination in freights against Leadville smelters.

THE Bethlehem Iron Company has struck out in a new direction. It has acquired mines, reported to be very great deposits of pure and uniform specular ore, in the island of Cuba, at a distance of four miles from the coast, and, by a line to be run, fifteen miles from Santiago, a good port. The ore is so readily accessible that it can be mined by open-cut work, and can be loaded directly into the cars. Until the railroad has been built to the port in question, the ore will be transferred by lighters at the nearest point on the coast to the vessels. With striking short-sightedness, the Spanish government promptly proposed to put on an export duty of 40 cents per ton; but we understand that this has been abandoned. If the deposits are all that we hear them reported to be—and our information comes from a trustworthy source—then these Cuban mines may be expected to rival the famous Bilbao mines. It is estimated that the ore can be put on board cars at mines at a maximum cost of 50 cents per ton.

IF the rumors are true that the lake producers have made contracts for additional shipments abroad, carrying the total, including the 2,750,000 pounds noted in our last, to 10,000,000 pounds, the metal is destined to take a firmer position. As yet the statement that such heavy transactions have taken place is not confirmed, but we are in a position to state that negotiations have certainly been going on. Rumor places the price at 16 cents; but it is a little doubtful whether some concessions would not be exacted by buyers of such large lots. So far as we are able to learn, no Western producers have this time entered into the pool, though ultimately probably some of the largest will find it expedient to co-operate with the lake producers in some way. As we pointed out in our last issue, heavy export sales put quite a different face on the status of the metal. They effectually put a quietus on all such talk as we have been hearing of late, that the great lake companies would kill off the small ones, or that they would put prices to such a figure that the new Western enterprises would be crowded to the wall. They have adopted the conservative policy which their relations with consumers seem to dictate. By clearing away their surplus, the lake companies will be in a position to make a price for their next home contracts, which will not be much, if any, lower than those made at the beginning of the year. The coming months will show to what extent other brands have succeeded in gaining a foothold among consumers, and this will be reflected by lesser requirements of the standard brand. The inducement as held out during the past months of a difference in price between lake and other brands, ranging from one to two cents per pound, is alone responsible for the steady appearance on the market of small lots of Lake copper, which have been selling down from 18 cents, until this week we hear of transactions based on 17⅛@17¼ cents, it being difficult to place copper at the latter figure. In the aggregate, this movement must have been quite important, and the early future will show whether or not it has injured the quality of manufactured goods to any appreciable extent. Our manufacturers have been spoiled by the good quality of Lake, and in rolling have become accustomed to subjecting the metal to the severest treatment without any fear of disastrous results. They can not do this with other copper, and we have reason to believe that it will take some time before our rule-of-thumb foremen know how to handle other grades. With such a difference in prices, we are convinced that it must be profitable to use phosphorus, manganese, and other compounds whose action in promoting density of casting and in improving the mechanical qualities of the metal is well established. The

Digitized by Google

exceptional quality of our raw material has aided our manufacturers wonderfully. They must now learn how to use for many purposes copper which anywhere else would be rated very high, but which does not quite come up to Lake. Upon our refiners devolves a very important duty—that of watching ceaselessly over the uniformity of their product, so as to gain the confidence of consumers. They have made strong and well-directed efforts in this direction, and some of them are so anxious to avoid all possibility of danger to their product that they decline to allow raw material containing certain impurities, notably arsenic, to enter their works. Smelters in the West should thoroughly understand this. It is largely their fault when, by undue anxiety to reach a high-grade shipping product by as few smeltings as possible, they render its quality almost irremediably bad.

Nothing but earnest co-operation on the part of smelters, refiners, and manufacturers can place the new brands of copper on the footing which they deserve to occupy, and prevent a depreciation in the quality of manufactured goods, the consumers of which are accustomed to so high a standard.

OFFICIAL STATEMENTS AND REPORTS.

FRANKLIN, LAKE SUPERIOR.

The annual report of Treasurer D. L. Demmon for 1882 shows a surplus of $244,330.37 January 1st, 1883, against $116,842.65 January 1st, 1882, including the rock broken in the mine, which, although valued at say $30,000, is not reckoned this year. Since January 1st, the loan account, $20,000, has been paid from sales of copper, and the company is now, for the first time since given up by tributers, entirely free from debt for borrowed money, owing only its regular business drafts for labor, supplies, etc. The question of a dividend has been considered; but so far the directors have refrained from paying one, because to do so would necessitate the borrowing of the entire amount paid, as the surplus consists mostly of copper and supplies, the amount of cash on hand being only about sufficient, with receipts from present sales, to meet the regular running expenses of the mine. The unsettled condition of the tariff at the time the report was written also acted as a deterrent. Further consideration of the matter will probably come up at the annual meeting. While no dividends have ever been paid, the treasurer congratulates the stockholders on an appreciation of the stock since operations were commenced, eight years ago, from $3@3.50 to $12@$12.50 per share, besides interest at 12 per cent per annum on the amount invested, "which investment," the report says, "surely is not a bad one, considering that no money has ever been called from the stockholders, and that the mine was considered played out at the time work was commenced." During the year, 148,042 tons of rock were hoisted and treated, at a cost of $2.35 per ton; number of pounds of mineral per ton, 26·86; number of pounds of ingot per ton, 22·02; average yield of ingot from mineral, 82·22; amount of ingot produced, 3,264,120 pounds, or a gain over 1881 of 585,323 pounds; yield per ton of rock, 1·168 per cent mineral, being a gain over 1881 of 0·26 per cent in richness of ore. The cash receipts and expenses for 1882 were:

Cash on hand January 1st, 1882	$25,588 58
Sale of copper in 1882, 2,773,714 pounds, at 18·174c	505,007.61
Loans	219,135.37
Sale of silver	880.04
Sale of supplies at mine	736.32
Interest account	523.19
Rebate on freight	659.35
Total	$752,530.46

CONTRA.

Cash paid loans	$295,855.54
Drafts	364,924.93
Smelting	38,241.10
Freight and storage	14,310.02
Brokerage	2,619.09
Interest	5,554.44
Expense, insurance, taxes, etc	8,418.52
Mine account, Nashua Iron and Steel Company (old claim)	604.16
Cash on hand January 1st, 1883	21,912.66
Total	$752,530.46

The assets and liabilities January 1st, 1883, were:

ASSETS.

Copper on hand, 1,315,858 pounds, at 18c. (840,000 pounds of which have been sold for early deliveries.)	$236,854.44
Cash on hand	21,912.66
Total	$258,767.10

LIABILITIES.

Loans, bills payable	$20,000.00	
Drafts outstanding	27,474.30	
Due for smelting	7,659.57	
Due for freight	2,771.73	57,905.60
Surplus assets at Boston		$200,861.50
Supplies at mine	$79,880.55	
Less liabilities at mine	36,411.68	43,468.87
Entire resources over liabilities		$244,330.37

The report of Superintendent J. Vivian notes the progress of development and improvements of the year, and calls attention to the necessity of soon providing coal for fuel, wood having become scarce. The prospects of the mine are as good for 1883 as they were January 1st, 1882.

CONGLOMERATE, LAKE SUPERIOR.

Under date of March 12th, Mr. Henry C. Davis, President of the Conglomerate Mining Company, of Philadelphia, reports that during the year 1882 the company did 2001·5 feet of sinking of shafts and winzes, extended the levels of the mine 3253·4 lineal feet, and stoped 2699·82 fathoms, the total openings to the end of the year being 10,943 feet. The ground on the lower levels of No. 2 shaft looks promising and in other parts of the mine the prospects are encouraging. The average wages have been as follows:

	1882.	1881.
Contract miners (per month)	$56.68	$56.42
Company miners (per month)	45.00	46.54
Underground laborers (per month)	38.74	37.31

Average cost of underground work:

	1882.	1881.
Sinking, per foot	$12.31	$14.75
Drifting, "	10.52	11.11
Stoping, per fathom	9.23	17.63

The Conglomerate, which is now the most conspicuous in Keweenaw County, is rapidly approaching the time when the heavy outlay for development-work and surface improvements will be completed. The heaviest expenditure was for the new mill, the stamps of which are now erecting, and for the railroad to it, and the last of the heavy items of new construction account, the permanent hoisting plant, is now contracting for. During the year, the company has stamped in its old mill 41,104 tons of rock, at a cost of $1.06¼ per ton. Mr. Davis says: "The yield of mineral copper was 991,375 pounds, equal to 1·20 per cent, a very satisfactory result, considering that the large proportion of rock stamped was from openings. In my last annual report, $3 was taken as the maximum cost per ton of rock. The experience and expenses of the past year, considering the thorough equipment we are making, justify the statement that the rock can be handled for $2.25, and may be handled for $2 per ton."

The expenditures for the year were:

Underground cost		$142,764.68
Surface and incident to the mine		110,673.12
Construction account		134,668.41
Debit of team account		1,712.23
		$389,818.44
Credited by		
Merchandise profit	$14,322.85	
Supplies profit	10,963.14	
Wood account profit	740.10	
Repair account profit	1,358.82	27,384.91
Total for 1882		$362,433.53
Before reported for 1881		360,467.98
Total to December 31st, 1882		$722,900.91
Less copper produced		173,132.98
Making net cost of openings and equipment		$549,767.93

The resources of the company include cash, $50,311.42; balance of last installment, $71,846; copper at mine, $20,000; merchandise, supplies, etc., at mine, $72,906.44; a total of $215,063.86. The liabilities, including bills payable, $10,895; loans, $7000; agent's drafts, $4703.72; wages, $7000, and unpaid bills, the whole aggregating $34,976.23, leaving a balance of resources of $180,087.63.

PEWABIC, LAKE SUPERIOR.

The annual report of the Pewabic mine, which adjoins the Quincy on the south, is not encouraging. During the year, a large amount of development-work has been done in the 26th, 27th, 28th, 29th, and 30th levels, uncovering hardly any thing but poor ground, the expenditure in this work being $47,950.91, including 1500 feet of drifting on the main lode at $15.80 per foot, 55 feet of drifting on the west lode at $12, 126·5 feet of cross-cutting at $13.50, 375 feet of winzes at $15.80, and 375 feet of shaft sinking at $18.22 per foot. In the deepest workings, the 30th level, south, the ground has been improving and the mine is showing better.

The agent, Mr. J. Vivian, says of the future: "At this writing, it is impossible to predict, with the least degree of certainty, what can be done for the ensuing year in the way of product; for as you are aware, our productive ground, that will pay to stope, is getting very short, and unless we find in some of the lower levels remunerative ground, I can not see how the present product can be kept up. You can not fail to notice in the map of the mine, that there is a large amount of ground opened. If it was all as productive as what we had above the 25th level, it would be sufficient to supply our present hoisting facilities for over two years, without opening another foot in any direction. When the company purchased the new territory, it was the opinion of every body that knew any thing about such matters, that it was a prize, and nothing short of large dividends would be in order at an early day; and had the lode continued to be as productive as it was when we started on the new ground in November, 1879, long ere this these expectations would have been realized. Being fully persuaded that the lode in the new territory would be at least as productive as it has been in the old ground for many years past, we started to put the mine, mill, machinery, and surface in the best possible condition for economical working; to do this, it has cost a large amount of money; but, had the mine continued to yield as in former years, all these improvements, repairs, etc., would have been paid for out of the profits made, and the last assessment never heard of."

The mine is fairly well equipped. During 1882, $18,193.77 were expended in buildings, $6353.40 in surface improvements, $12,206.30 for the stamp-mill, including $2036.45 for a duplex pump with a capacity of 2000 gallons per minute, and $45,920.81 for tools and machinery. This includes $6723 for 17 Rand drills, $5738.72 for a duplex air-compressor, $4575 for air-pipe and labor, etc., $2525 for two Blake crushers, and $14,163.85 for repairs to the man-engine, which is in operation to the 16th level. Considerable change and improvement have been made in the hoisting-engine, by sliding the pinion-wheel on the side which detaches the engine from the hoisting-drum and putting two band-brakes on said drum, by which the skip is lowered while the engine is standing still. With this arrangement, the hoisting capacity has been greatly increased and the engine has been saved from more than half of its usual wear and tear. The total of extraordinary expenditures, including the dead-work in the mine, has been $130,625.22.

The following is a statement of the production and cost of stamping:

Number of tons of rock hoisted in 1882, 74,042.
Number of tons of rock stamped, 63,592.
Cost per ton, entire treatment, $3.03.
Pounds of mineral, per ton hoisted, 24·16.
Pounds of ingot, per ton hoisted, 20·02.
Percentage of ingot in mineral, 82·88.
Total amount of ingot produced, 1,482,664 pounds.
Tons of rock stamped, per cord of wood, 10·84.
Cost of stamping, per ton of rock, 0·64·97.

Digitized by Google

In 1881, 60,427 tons were stamped, giving a yield of 1,872,878 pounds, or 1·92 per cent.
In 1882, 63,592 tons were stamped, giving a yield of 1,482,664 pounds, or 1·51 yield, showing a decrease of 0·41 per cent in yield, and an *increase* in amount stamped of 3165 tons.

The cash receipts foot up to $678,928.14, including cash on hand January 1st, 1882, $26,557.97; sale of 1,328,496 pounds of copper at a price of 18·35c., $243,777.05; loans, $349,441.53; and assessments, $57,528. The payments were $358,916.53; agent's drafts, $254,802.66; smelting and freight, $28,324.19; and other miscellaneous expenditures, leaving cash on hand January 1st, of $16,246.96.

The assets include 572,509 pounds of copper, valued at 18 cents, or $103,051.92, and assessments uncollected, $22,472. The liabilities include loans of $89,500, outstanding drafts, etc., aggregating $114,088.10, leaving a balance of assets at Boston of $27,682.48, to which are added excess of supplies at mine over liabilities of $32,841.52, making the total balance of assets over liabilities $60,524.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

RECENT RULINGS AND DECISIONS OF THE GENERAL LAND-OFFICE.

Oil Lands.—Oil lands may be located and patented under the placer mining laws.

Expenditures on Mining Claims.—The value of expenditures upon mining claims is to be measured by the ruling prices of labor and material in the locality where the claims are situated.

Rehearings.—The rule of law is well settled that a new trial will not be granted on the ground that the verdict was against the weight of evidence, if there was evidence on both sides which was contradictory. This rule was applied in a mining case upon an application for a rehearing.

After a witness in the hearing of a mining contest has given his testimony, taken by consent by a short-hand reporter, and by stipulation it has been agreed that the testimony shall be considered the same as if it had been reduced to writing and signed, and after the testimony has been taken at the local office and has been considered and the case decided in the General Land-Office, it is not competent, on a motion for a rehearing, to introduce affidavits to show that the witness testified differently from what the record shows, or that he did not make certain statements which the record shows he did make.

Newly Discovered Testimony.—After a party has had a fair and full hearing before the local land officers, and the testimony has been considered and the case decided in the General Land-Office, affidavits which contain statements of facts on a point which was material, and which statements are merely cumulative, and no sufficient reason is shown why the makers of such affidavits were not produced at the hearing before the local office, such affidavits will not afford a basis for a rehearing on the ground of newly-discovered evidence.

Publicity of Surveyor's Reports on Placer Claims.—Under circular issued originally under the date of September 22d, 1882, with special reference to placer claims, by the Commissioner of the General Land-Office and approved by the Secretary of the Interior, no placer claim is granted unless favorably reported upon by a deputy surveyor, and approved by a surveyor-general. The Commissioner of the General Land-Office now rules that an attorney interested in a case can not see this report of the deputy surveyor, with which ruling much fault is found by attorneys practicing before the department, because it leaves them in the dark as to any errors that may have been found; and to obtain this necessary information causes unnecessary delay and additional expense.

The Conformity of Placer Claims with Public Land Surveys.—The following points were made in a case where parties attempted to secure a placer patent for a location upon surveyed land of twelve thousand feet, nearly all of which is the bed of a river, and includes only a small quantity of surface ground along its banks:

The first law authorizing the patenting of placer claims was the act of July 9th, 1870, which expressly states that the location made thereunder shall conform to the United States surveys. The act of May 10th, 1872, which is incorporated into Section 2331, United States Revised Statutes, provides, among other things, that all placer mining claims thereafter located upon surveyed lands "shall conform as nearly as practicable with the United States system of public land surveys, and the rectangular subdivisions of such surveys; . . . but where placer claims can not be conformed to legal subdivisions, survey and plot shall be made as upon unsurveyed lands. . . ." There were many tracts of surveyed land which could not be taken as placer claims so long as the locations had to conform to the public surveys, on account of the prior rights of other persons, especially lode claimants, to portions of the legal subdivisions embracing such tracts, and the purpose of the provisions of the act of 1872 was evidently to enable qualified parties to locate and obtain patents for the portions not previously appropriated or reserved. The privilege granted to lode claimants of taking their surface ground without regard to the public surveys, was never extended to placer claimants. The division of 40-acre tracts into 10-acre lots was authorized for the purpose of enabling the placer locators to conform to the surveys. The Commissioner says: "It can not be claimed that a location of a narrow strip of land, 12,000 feet long, extending through three sections (as this does), conforms 'as nearly as practicable' to the rectangular subdivisions of the public surveys, unless the adjoining land had been previously appropriated or reserved, which is not the fact in the present case. If such a construction was given to the provisions of the act of 1872, under consideration, they could in nearly every case be disregarded and rendered ineffective by the placer claimants. The locations would be made so as to cover only the valuable lands, and leaving the adjoining tracts in such a condition and situation as to make it impossible, in many cases, to dispose of them. In another case, this office says to a surveyor-general, after quoting the above-mentioned provisions of the act of 1872, that 'the location of a placer mine upon surveyed public lands made after May 10th, 1872, should embrace legal subdivisions of the public land, where the same can be done without interfering with the rights of other *bona-fide* mineral, agricultural, or other claimants in the same tract.' The only construction of the language referred to which is consistent with the context of the act and the general intention of Congress, as expressed in the laws upon the same subject, is, that the placer locations upon the conveyed lands shall conform to the public surveys in all cases, except where this is rendered impossible by the previous appropriation or reservation of a portion of the legal subdivision of ten acres upon which the claim is situated.

"There appears to be another serious objection to the location in question. It covers the bed of a river for a long distance; and should the applicant obtain a patent, he would acquire the right to and control over the water in that portion of the stream lying within his claim. It has been the policy of the government to withhold patents for water rights, and leave them to be determined and protected by the local courts. It was clearly not the intention of Congress to allow a large river for two or three miles, with only a few feet of ground along its banks, to be patented as a placer claim."

THE NEW WYOMING VALLEY SALT REGION.

So much has been written and said during the past few months by persons not familiar with the salt industry on the Wyoming Valley salt deposits that the following extracts from a letter by Mr. Sylvester Lewis, of Wyoming, to the Rochester *Morning Herald*, will be perused with more than passing interest:

In the first place, I will state that there is an inexhaustible bed or rock of salt extending through the entire valley at an average depth of about 1200 feet. The rock or deposit has an average thickness of about seventy feet, and is known to be perfectly pure, and in regard to the purity of the brine procured from this deposit, it will depend in a great measure upon the condition and purity of the fresh water which is run into the wells for the purpose of dissolving the rock. In regard to its strength, it can be procured and brought to the surface of a uniform strength or at complete saturation provided the water is allowed to remain in the wells a sufficient length of time to become saturated. The advantages the valley possesses over other salt-producing localities are many, and the first and the one most to be relied upon is the strength and purity of the brine. In order to give the reader a more perfect knowledge of the subject, I will make a comparison of the brine produced at Syracuse with that of the Wyoming Valley. Hon. George Geddes, superintendent of the Onondaga salt springs, as far back as 1867, when the brine of those springs was known to be much stronger and purer than now, said, as can be seen on page three of his answers to interrogations of the constitutional convention which assembled at that time, that it required an average of fifty gallons of brine to make a bushel of salt of fifty-six pounds weight. Professor Lattimer, of the University of Rochester, in 1879 made an analysis of brine taken from the first well put down in the Wyoming Valley, which is situated one half-mile south of the village of Wyoming. The professor, in closing his report, says that twenty-four gallons of this brine will make a bushel of salt of fifty-six pounds weight. In regard to solar evaporation, Mr. Geddes, in his report to the constitutional convention, says that a vat sixteen by eighteen feet was capable of making fifty bushels or ten barrels of salt in an average season; whereas the Wyoming Valley Salt Company made in the season of 1881 twenty-two barrels of salt under cover of sixteen by eighteen feet. The size of salt-vats is known by salt manufacturers by the size of the cover, and is generally spoken of as so much salt having been made to the cover. Now, in regard to the manufacture of salt at Saginaw compared with that of the Wyoming Valley, I will refer to a statement of the Hon. Thomas G. Alvord, made to a joint committee of the Legislature February 17th, 1876. In answer to a question put by the committee, "How does the purity of the Godrich wells compare with that of the Saginaw wells?" Mr. Alvord says, "The Godrich water is very nearly both pure and saturated; ours is impure, and measures less than seventy degrees of salinometer. The Saginaw wells are very much inferior to ours." So that, if we are to take the statement of Mr. Alvord as correct, the same difference exists in regard to the strength and purity of the brine at Saginaw, compared with that of Wyoming, as exists between the Onondaga salt springs and the brine of the Wyoming Valley. The only difference in the expense of manufacture of salt at Saginaw and Syracuse is, that the Saginaw manufacturer is using the refuse from the manufacture of lumber; but the timber of Michigan is fast being used up, and as soon as Saginaw has to fall back upon coal as a fuel, it will be in the same predicament that Syracuse is now in, and both in time will have to succumb to the rich saline deposit of the Wyoming Valley. It can not be otherwise, as the same amount of fuel and labor that would make one bushel of salt at Saginaw or Syracuse will make two bushels at any of the works of the Wyoming Valley, and of a much superior quality. In regard to the salt-fields of Canada, compared with those of the valley, there is no difference in strength or purity of brine, and the Canadian manufacturer has to depend wholly upon wood.

The strongest proof that the Wyoming Valley is to be the great salt center of the world is the fact that the manufacturers of salt from all parts of the world are making tracks toward the valley. One large manufacturer of salt in Canada has already purchased a site on the line of the Rochester & Pittsburg Railroad, near the depot at Warsaw, and will soon begin the erection of large works. This is evidence that the salt manufacturers of Canada are satisfied that the Wyoming Valley is to supersede all other salt-producing localities. In regard to available places for putting down wells, there are hundreds of them in the valley, many of them superior to any yet located in regard to water and fuel supplies The Rochester & Pittsburg Railroad will soon be extended to its large coal-fields, and I am warranted in saying that in a very short time coal will be laid down in the valley for $2.50 a ton. In regard to transportation, we need have no fear, as the Rochester & Pittsburg Railroad traverses the entire length of the valley, and the Lackawanna road crosses the valley only a few miles north of the center of the great salt-deposit. These roads have connections east, west, north, and south, and have ample facilities for the transportation of our salt. The interests of the railroad companies are identical with the interests of the salt manufacturers. Both of these companies are owners of large coal-fields, and they want to sell their coal and carry our salt; and if the managers of these roads are the smart men I take them to be, they will put such low figures on coal and such reasonable rates on freight as will prevent any judicious capitalist from putting money into competing lines. The Rochester & Pittsburg Company, to my knowledge, has done all that could be reasonably expected to assist in developing the salt interests of the valley.

OUR PRODUCTION OF PIG-IRON IN 1882.

Mr. James M. Swank, Secretary of the American Iron and Steel Association, has just published the complete statistics of the production of pig-iron, his figures standing as follows:

PRODUCTION OF ALL KINDS OF PIG-IRON IN 1880, 1881, AND 1882, BY STATES.

States.	Net tons. 1880.	(Tons of 2000 pounds.) 1881.	1882.
Maine	3,578	4,400	4,100
Vermont	1,800	2,796	1,210
Massachusetts	19,017	18,318	10,335
Connecticut	22,583	28,483	24,342
New York	395,361	359,519	416,156
New Jersey	170,049	171,672	176,805
Pennsylvania	2,083,121	2,190,786	2,449,256
Maryland	61,437	48,756	54,524
Virginia	29,934	83,711	87,731
North Carolina	.....	800	1,150
Georgia	27,321	37,404	42,440
Alabama	77,190	98,081	112,765
Texas	2,500	3,000	1,321
West Virginia	70,338	66,409	73,220
Kentucky	57,708	45,973	66,522
Tennessee	70,873	87,406	137,602
Ohio	674,207	710,546	698,900
Indiana	12,500	7,300	10,000
Illinois	150,556	251,781	360,407
Michigan	154,424	187,043	210,195
Wisconsin	96,842	102,029	85,859
Missouri	105,555	109,799	113,644
Minnesota	3,520	7,442	8,126
Utah	.....	.....	57
Colorado	.....	6,396	23,718
Oregon	5,000	6,100	6,750
California	.....	4,414	987
Washington Territory	.....	1,200	.....
Total	$4,295,414	$4,641,564	$5,178,122

This output was distributed, as to the fuel used, as follows:

Kinds of fuel.	Net tons. 1880.	(Tons of 2000 pounds.) 1881.	1882.
Anthracite	1,807,651	1,734,462	2,042,138
Charcoal	537,558	638,838	697,906
Bituminous	1,950,005	2,268,264	2,438,078
Total	4,295,414	4,641,564	5,178,122

In the following States and territories, more than 20,000 net tons of harcoal pig-iron were produced annually:

CHARCOAL PIG.

States.	Net tons. 1880.	(Tons of 2000 pounds.) 1881.	1882.
Connecticut	22,583	28,483	24,342
New York	27,844	30,467	30,716
Pennsylvania	43,374	51,908	49,975
Maryland	33,050	27,626	28,277
Virginia	14,043	19,038	26,133
Alabama	37,737	44,221	55,541
Kentucky	21,174	16,778	17,165
Tennessee	16,675	19,046	37,611
Ohio	69,190	66,169	58,654
Michigan	154,424	187,043	210,195
Wisconsin	42,913	47,702	55,369
Missouri	15,769	43,241	54,327

Of pig produced with bituminous coal or coke, the following States were producers:

BITUMINOUS COAL AND COKE PIG.

States.	Net tons. 1880.	(Tons of 2000 pounds.) 1881.	1882.
New York	.....	6,703	.....

QUICKSILVER IN BLENDE.—*Die Oesterreichsche Zeitschrift für Berg- und Hütten-Wesen* announces that an interesting discovery has just been made at the zinc-works of the Vieille Montagne Company, at Oberhausen. It has been found that quicksilver was conveyed by the gases which passed from the Hasenclever furnace into the lead chamber. A special furnace was built for extracting the quicksilver, and during 1882 several tons were obtained. It is believed that all the blendes of the Rhine district contain quicksilver, which may be extracted in paying quantities.

THE ELECTRO AMALGAMATION OF GOLD ORES.

English technical journals have, during the past few weeks, published a good many statements, wild on the face of them, about a new gold amalgamating process. The first fairly intelligent and critical account has just been given by *Engineering*, which therefore deserves consideration:

In gold mining from quartz reefs, the rock is, as is well known, reduced to powder by means of stampers, and is then carried by a stream of water over the surface of mercury. In consequence of the strong affinity between gold and mercury, as soon as a particle of the former comes into contact with the latter, it is absorbed and amalgamated, while the quartz fragments with which it is associated float on the surface of the metal, and are carried away by the stream of water. But besides gold, many other substances, such as oxygen, sulphur, and arsenic, have an affinity, more or less active, for mercury, and many if not all of them are found mixed with the gold in certain deposits. When an ore containing these elements is passed over mercury to eliminate the gold, the other bodies are also retained, and being of much less specific gravity than the mercury, they float on its surface, combining with its upper stratum, and adhering with a persistence that can not be overcome by any stream of water that is not of sufficient force to carry off not only the quartz, but also the gold and part of the mercury. This result is termed by the miners "sickening," and involves great loss of gold, because, as soon as the surface of the mercury becomes "sick," the gold no longer comes actually into contact with it, and the greater part escapes. The remedy hitherto employed has been to remove the sick mercury at frequent intervals and distill it, exactly as water is distilled; but this of course involves additional expense, and in many mines the extra cost, and the loss which takes place, in spite of all care, are sufficient to convert a profit into a loss.

Lately, Mr. Richard Barker, F.G.S., has brought out a new method of recovering sick mercury, or rather, of preventing it from becoming sick. According to his process, he connects the mercury with the zinc pole of a galvanic battery or of a dynamo machine, and the water flowing over it with the copper pole of the same generator. Thus he gets a current of electricity flowing from the water to the mercury. The result is certainly very surprising: as soon as contact is made, the black scum accumulated upon the surface of the mercury retreats from the electric terminal as if driven by a steady blast of air, and the bright surface of the metal is exposed to view ready to receive any thing that passes over it.

This is by no means the first time that attention has been called to the peculiar behavior of mercury when acting as an electrolytic surface. In the early part of the century, Gerboni, Herschel, and Davy noticed it. In 1875, Sir Charles Wheatstone patented a telegraphic instrument in which the indications resulted from the motions of a column of mercury under varying currents; and a little later, Mr. Robert Sabine made a thorough investigation of the subject. He found that when water is placed upon the surface of mercury, the latter immediately becomes converted into suboxide, if it be not already so. If the water and mercury be then connected with the battery in the manner described above, the suboxide is reduced and the surface becomes metallic. With powerful currents, this action, owing to the difference in bulk of the metal and the oxide, is accompanied with rapid circulation of the metal. If a globule of mercury be placed in a narrow groove filled with water so as to divide it into two parts, and a current be passed lengthwise through the groove, one end of the globule will be continually converted to suboxide and the other deoxidized. Now as the atomic value of the mercury is 14·7 and that of the suboxide may be taken at 38·9, there is a great expansion at one end of the globule, causing a mechanical circulation of its molecules from the larger to the smaller end, and a rolling action which carries the mercury bodily forward in the direction of the current.

Applying these facts to the explanation of the action of Mr. Barker's electro-amalgamator, it will be seen that there is a constant electrolytic action going on at the surface of the mercury, and that, when this is exposed to water only, the process is simply a deoxidizing one. When, however, sickening ores are passing over the mercury, the action of the current will be to break up any combination that may take place between the mercury and such of their elements as are included in the list of substances which, under the influence of electrolysis, are carried to the anode. These are the metalloids, such as oxygen, sulphur, chlorine, boron, carbon, and perhaps arsenic. It is not distinctly known what is the exact cause of the sickening of mercury, but there is good reason to believe that sulphur and arsenic are the most potent agents in the matter. Hence, while their chemical affinity would cause them to combine with the mercury, their electro-negative condition prevents their union with its electrolytic surface, when a current is passing through them. On the other hand, the combination with the mercury of all the negative metals, gold, silver, copper, tin, lead, nickel, zinc, etc., would be favored by the current.

It will thus be seen that the action of the electric current in an amalgamating riffle tends to prevent the combination and adhesion of any electro-positive elements to the mercury, and to leave the quartz, with the sickening ores, floating mechanically on its surface, ready to be carried off by the current of water. This effect is exhibited by the Electro-Amalgamation Company, Limited, No. 37 Lower Chambers, Moorgate, London, on a considerable scale. The company has fitted up several amalgamating apparatus, consisting of inclined tables about six feet wide, with riffles or baths of mercury placed at intervals. The bottom of each riffle is of copper, and is connected with one pole of an Elmore dynamo machine; while over the top, separated from the mercury by a space of about half an inch, is another plate of copper, connected with the other pole of the generator. A stream of water carries the pulverized ore down the table and between the mercury and the upper plate, the dirt being carried forward by the current, and the gold retained by the bright, clean surface of the mercury. In some cases, stirrers and rakes of various kinds are adopted in place of the upper pole plate, according to the nature of the rock treated.

But the attainment of a clean mercurial surface is not all that stands between the gold miner and success in amalgamation. Much gold is "rusty," that is, it is coated with a skin or pellicle of sulphuret, probably from contact with sulphureted hydrogen. A piece of such gold may be immersed in perfectly pure mercury without any amalgamating

action whatever, and consequently the mercurial process has hitherto been useless for its recovery, and rusty ores have been smelted. This raises the cost of milling in Colorado from $1.50 to $15 per ton of dirt—a notable difference. The company claims that the new process is effectual for causing the amalgamation of rusty ores, but it does not offer any satisfactory explanation of the action by which it operates beyond stating that "by electric action the gold and silver are driven to the negative pole, and . . . . it is obvious that the natural gravitation of the gold and silver is so assisted by the attraction of the electric force as to allow but few if any of the particles to escape." This can scarcely be called a scientific explanation, but we understand that a considerable consignment of rusty ore is on its way, and then the result may be determined by actual experiment. If successful in this respect, Mr. Barker's invention promises to be extremely valuable, while, under any circumstances, its power of maintaining the surfaces of the riffles free from contamination, if found to be as effectual in actual practice as in experiment, must open to it a wide field of usefulness.

DESTRUCTION OF THE LOISEAU FUEL-WORKS.

Care might have prevented the destruction of the Loiseau Patent Fuel-Works at Linden and Bath streets, Port Richmond, which were almost entirely swept away by the flames shortly after two o'clock on the afternoon of the 8th. The works comprised three adjoining structures arranged in the shape of an L, and were devoted to the manufacture of fuel from coal-dust and tar. The fire was caused by gas generating in the large iron vessels in which the tar is heated preparatory to mixing the coal-dust. It appears that one of the employés was negligent in not taking precautions to let the gas find an exit; and when he endeavored to open a valve attached to the apparatus, it is supposed that the accumulation of gas was ignited by a fire under the boiler, and a slight explosion followed. The flames burst out all around the machine, and in an instant the entire room was on fire. Owing to the highly inflammable character of the contents of the place, the fire spread with alarming rapidity. Great columns of black smoke rolled up from the burning tar so thickly at times that the entire works were obscured from view, and put the firemen to serious inconvenience. The fire soon communicated from the pitch-house to the finishing-house, a large frame building where the artificial coal is dried, which, together with the other buildings, was entirely destroyed. The third building, a brick structure adjoining the finishing-house, was considerably damaged. A large shed, a few yards from the pitch-house, also fell a prey to the devouring element. The works were erected about eight years ago, but operations were suspended until a year or so ago. The building in which the fire originated was thought to be fire-proof. The buildings were owned by the Philadelphia & Reading Railroad Company, which was also the owner of about $30,000 worth of the machinery in the establishment. Recent improvements were made by the Fuel Company, which put in machinery valued at about $12,000.

RECENT EXPERIMENTS IN LEAD SMELTING IN THE HARTZ MOUNTAINS.

At one of the smelting-works of the mining district of the Upper Hartz Mountains, at Altenau, lead ores are smelted which, in their composition, differ from most of the ores of the district in being lower in lead and higher in quartz and blende. These could be readily worked by the ordinary Hartz smelting process in cupolas, with fluxes containing iron, while the supply of copper slags from Oker, containing a high percentage of iron, were still available. When, however, that supply had been exhausted, and "blue billy" obtained in the wet extraction of copper from low-grade pyrites had to be substituted for the slags, the fact that the "blue billy" was a powder and contained from 15 to 20 per cent of water increased the difficulties in working and ran up the cost. In 1877, the order was therefore given to begin a series of experiments with the roasting and reducing process, as a substitute for the "precipitation" process. The results of these experiments have now been published by Herr Cramer von Clausbruch, of Altenau, in the *Zeitschrift des Berg-, Hütten- und Salinen-Wesens*. The ores worked contain from 54 to 55 per cent of lead, 0·08 per cent of silver, 0·9 per cent of copper, from 7 to 8 per cent of zinc, and from 14 to 18 per cent of silica. They are roasted in a single-hearth reverberatory furnace, 19 meters (62·3 feet) long and 3 meters wide (9·8 feet) in the clear, and provided with a series of condensation-chambers. It has 14 working-doors on both sides, and two fire-doors. Near the fire-bridge, the hearth is shaped into a shallow sump, to be used for containing the roasted charge when melted down. The ore is charged at the point farthest from the fire-bridge, and is gradually conveyed toward it. The bulk of the sulphur oxidized escapes as sulphurous acid, a small proportion forming sulphuric acid, which combines with oxide of lead to form a sulphate which, at a greater heat, is converted into a fusible silicate. The best results in roasting were obtained with ore running from 55 to 60 per cent of lead, and 15 per cent of silica. The ore must be as fine as possible, not exceeding 2 millimeters (0·08 inch). With a smaller amount of silica, a part of the sulphate of lead is not decomposed, and leads to the formation, in the final heat, of a matte, which is not unfavorable when there is copper in the ore.

The furnace at Altenau takes four charges of 30 cwts. per day of twenty-four hours, the consumption of coal being 22 cwts., or 18·3 per cent. The yield from 100 parts of ore is 85 parts of well-slagged material, ten parts of a mixture of slagged and so-called "raw" material, from 2 to 3 per cent of "raw" stuff, and from 2 to 3 per cent loss of weight in roasting, etc. The slag is almost entirely free from sulphur, contains only traces of the copper in the ore, and runs about one half of the percentage of silver in the ore, almost all the copper and the bulk of the silver apparently going with the sulphur.

The roasted and slagged ore is smelted in blast-furnaces, having two tuyeres and a water-jacketed back wall, and, in view of the basic character of the charge, not provided with a siphon-tap or a closed front. The object of the smelting is to reduce the lead in the silicate and to reduce so much iron from the charge as is necessary to decompose the sulphide of lead. At present, 80 cwts. of roasted ore are mixed with 20 cwts. of raw ore, preferably those grades running higher in pyrites, and to this charge of 100 cwts. are added, according to the percentage of silver and zinc, from 20 to 25 cwts. of puddling cinder, from 20 to 25 cwts. of Oker blue billy, practically iron ore, from 15 to 30 cwts. of lime, and from 32 to 34 cwts. of coke. From 176 to 187 cwts. of charge are put through in twenty-four hours, the pressure of the blast ranging from 14 to 20 millimeters of quicksilver. The furnace is run by three shifts of men, including one furnace-man, one slag-man, and two chargers.

In examining the charge, the addition of raw ore will appear strange; but it is considered necessary to make a matte for the sake of the copper left in the blue billy and the percentage of that metal in the ore. It might be suggested that the roasting process be so conducted that the quantity of sulphur necessary to make matte be left in the ore at once. This, however, would make it necessary to roast the raw ore now charged directly, and besides would not make it possible to conduct the roasting process in the proper way. It was thought that lime could be largely used as a basic flux, as it is cheap and would make light slags. It was found, however, that the quantity is limited by the presence of zinc.

In the assay of the slag, fine silver is added; and by this means, the returns are one quarter of one per cent higher than with ordinary assays. The percentage of lead thus found in the slags ranges from 0·5 to 0·75 per cent, all lots containing more being returned to the furnace. An analysis made of the slag produced in the first quarter of 1882 gave the following result:

	Per cen
Silica	30·32
Sulphate of baryta	0·19
Lead	0·13
Copper	0·18
Silver	0·0007
Antimony	0·09
Protoxide of iron	35·72
Alumina	3·20
Oxide of zinc	7·27
Oxide of manganese	1·66
Nickel and cobalt	Trace
Lime	16·15
Potassa	0·67
Soda	0·61
Sulphur	1·47
Phosphoric acid	2·04

Contrary to opinions expressed, the cost of the process is not much less than the old precipitation process. It is more costly so far as labor and fluxes are concerned, but lower in fuel, the net gain for Altenau being 6·51 marks per 100 cwts. of ore.

The percentage of lead contained in the ore, as found by fire-assay, is fully recovered on a large scale, 98·5 per cent being obtained at once in the base bullion. The yield of silver is larger than the returns by fire-assay.

THE MECHANICAL ENGINEERING OF COLLIERIES.*

Compared with the elaborate and accurate text-books which English literature possesses on metallurgy and on many branches of civil and mechanical engineering, the great field of the mining engineer here has been sadly neglected by writers. British students and engineers are very much better off than those interested in the subject of mining in this country. We do not possess a single manual, a single text-book or work of reference representative of American practice, and those who want to "read up" must hunt over large libraries, through the files of technical journals, the transactions of engineering societies, and the reports of State surveys to cull the few fragments of experience put on record. There is much that is characteristic in American practice, developed by the special exigencies of the cases met with here; and without careful study and quite extensive travel, it is unfortunately impossible to get a fair insight into our methods. We know of many interested in coal mining in widely separated sections of our country who have spent weeks in watching the works in the anthracite collieries of Pennsylvania, and we have no doubt that to them the widely different methods in use in English collieries will prove a subject full of valuable suggestions.

A very large proportion of the coal mined in this country is brought to the surface through tunnels driven on the vein, and, with the exception of a few slopes and one deep shaft in the anthracite regions, nothing but comparatively shallow pits, rarely exceeding 300 feet, are used. In almost every particular, the mechanical appliances we require are not of such gigantic dimensions, nor are they called upon for such a high duty, as the equipment in scores of collieries in England and Scotland. Yet the work before us is, we believe, one that is entitled to, and will undoubtedly receive, a place of honor in the library of every one who is engaged in coal mining. It is the first of two volumes, a considerably enlarged republication of a series of articles published by Mr. C. M. Percy, of Wigan, in the *Colliery Guardian*. Mr. Percy needs little introduction to those who have closely followed the literature of coal mining for years. He has been for a long period engaged in every-day practical work in the management of English collieries, is apparently a keen, progressive observer, and has the rare gift of presenting what he has seen and experienced in clear, plain language. Mr. Percy has not cared to startle his readers with numerous quotations from a wide range of literature. He writes what he has gleaned in an active business life, and warns his students against many an error the disastrous results of which he has had occasion to observe. He does not embarrass by an undue attention to details, and yet we have noticed in the pages of hi book many of the little "points," one alone of which we have often considered an ample reward for a day's persistent "pumping."

In the first volume, now before us, Mr. Percy deals with the laying out of surface plant, a work which, of course, is directly applicable to only a few American mines, the conditions being so widely different. Still, the chapter contains many suggestions of value. The second, third, and fourth chapters on winding or hoisting engines, with a series of notes on their various parts, fully illustrated with a number of plain outline cuts, will be fully appreciated. The fifth chapter gives an example of a horizontal hoisting-engine which probably would meet with more favor in this country than the single vertical engine at Monkwearmouth, described in the next chapter, which nevertheless, according to Mr. Percy, is doing excellent work. The Burns brake next engages Mr. Percy's attention, the principal points of this appliance to which

**The Mechanical Engineering of Collieries.* By C. M. Percy, Wigan. Volume I. Published by the *Colliery Guardian*, London.

Digitized by Google

Mr. Percy appears to attach much value being that a comparatively small brake-shoe is used. It is simply a block of pitch-pine, into which a number of holes have been drilled, filled with sand.

The important subject of ropes and drums, their cost, their safety, etc., is discussed at length in the eighth chapter; while the kindred subject of conductors and cages is taken up in the next. Mr. Percy gives some good points on head-gears and their construction; on detaching-hooks, screens, and tipple arrangements; and then goes, with considerable detail, into a description and discussion of underground and surface boilers.

In speaking of mechanical ventilation, Mr. Percy is rather non-committal, so far as the merits of various types of machines are concerned; but he does not hesitate to express his convictions on the question furnace *versus* fan, strongly advocating the latter.

Mr. Percy's work is now the best we have on the mechanical engineering of collieries, and, in the absence of any strictly American work, to a certain extent fills a want severely felt. It does not pretend to give working drawings of plants erected in England, and those seeking models will be disappointed. We heartily recommend the book to our readers.

THE AMMONIA INDUSTRY AND THE SCOTCH IRON MANUFACTURE.

Mr. Robert R. Tatlock, chemist, of Glasgow, gives some interesting details in regard to the manufacture, in Scotland, of ammonia from blast-furnace gas. It must be remembered by American readers that, unlike the greater number of our blast-furnaces, those of Scotland use raw coal. It had long been known that ammonia existed to an appreciable extent in the waste gases of blast-furnaces, as it does in the gaseous products of combustion from all coals; but the mechanical difficulties in the way of recovering it were so great that it was not attempted until quite recently, when Messrs. William Baird & Co., of Gartsherrie, Scotland, erected large and costly apparatus for condensing it in the form of ammonia liquor, as well as the tar which distills off from the coal in the upper part of the blast-furnace. When it is considered that an average furnace will consume 50 tons of coal per day, and each ton of coal burned gives 130,000 cubic feet of waste gases; that these have an initial temperature, after leaving the furnace, of about 500 degrees Fahr.; and that this enormous amount of hot gas, weighing about four tons, contains only about six pounds of ammonia, the difficulties with which the pioneers of this new industry had to contend can be realized. The result is, that at present about one ton of sulphate of ammonia per day is made at the Gartsherrie Iron-Works, with less than the waste gases from two furnaces; and it is said that the whole of the other furnaces belonging to the firm are, as quickly as possible, to be adapted to the production of ammonia. But while the erection of the enormous plant was going on, certain of the other Scotch iron-masters were not idle, and sought means of recovering the ammonia in other ways. More than one of them has experimented largely, and it is believed successfully, with the object of obviating the necessity of cooling such a large volume of gas, their method consisting in scrubbing the hot gases with a shower of sulphuric acid, producing sulphate of ammonia at once, which, however, is of a dark color unless much care is bestowed upon it in order to keep it clean. The latest, however, with regard to the recovering of ammonia from furnace gases is, that a celebrated firm of iron-masters in the neighborhood of Glasgow has secured full patent rights for fixing the ammonia by means of a sulphurous or other acid in the form of vapor or gas, which, meeting with the gaseous ammonia, forms at once a salt easy of condensation, and easily scrubbed with water, yielding a solution of some 60° Twaddle, instead of about 4° Twaddle, as in the condensation method. The product consists of a mixture of hypo-sulphite, sulphite, and sulphate of ammonia; but it must be borne in mind that for some purposes it is not necessary that the ammonia should be in the form of sulphate at all. For the Brünner and Mond ammonia-soda process, for instance, the less sulphate there is the better, as, when distilled with lime, in order to obtain the free ammonia, the residue in the stills will consist of a solution of the soluble hypo-sulphite and sulphite of calcium, instead of nearly insoluble sulphate. At present, the annual consumption of sulphate of ammonia in England is nearly 3000 tons for the ammonia-soda process alone, and the quantity will certainly increase. One great advantage of this method is, that it requires no sulphuric acid, the sulphurous acid being obtained by burning, in a suitable kiln, by means of the cold blast, the waste sulphurous "blues," which can be had in Scotland by the hundred thousand tons for the lifting. In any case, if it is required to produce the ammonia in the form of sulphate, that can easily be done by distilling with lime and receiving the evolved ammonia in sulphuric acid, as usual.

It is not difficult to make an estimate of the prospective amount of ammonia from this source, at least so far as Scotland is concerned, where there are probably as many as 130 blast-furnaces capable of being adapted to the recovery of the ammonia without injury to the gases for heating purposes, such as firing boilers and heating the blast. Each furnace consumes, say, 50 tons of coal per day, and each ton of coal is capable of yielding ammonia equal to about 25 pounds of sulphate. This gives for each furnace 1250 pounds of sulphate in 24 hours, or 72½ tons per day for all Scotland, or, for a year of 350 working days, 25,375 tons, the value of which, at present rates, is nearly two and a half million dollars; and probably the blast-furnaces working on coal in England are capable of producing quite as much.

FORMING SECONDARY BATTERIES.

From the English patent specification of Mr. C. Brush, the well-known Cleveland inventor, *Engineering* extracts the following interesting account of the difficulties experienced in forming secondary batteries: The most common form of secondary battery consists of two sheets of lead placed near together, but not in contact, and immersed in dilute sulphuric acid. When an electric current is passed through such an apparatus, water is decomposed; hydrogen is occluded by, or combines with, one of the lead plates, while oxygen combines with the other and forms a coating on it of peroxide of lead. This oxide of lead, not being capable of combining with any acid, is not affected by the presence of the sulphuric acid employed. Now, if the exciting current be removed, it will be found that the apparatus has become a powerful battery, giving a current in a direction opposite to that of the exciting one. But this current is of short duration. If, however, the charging current be reversed from time to time, frequently during the first few days and more rarely afterward, the capacity of the apparatus will be greatly increased. This constitutes the customary process of "forming" the plates of a secondary battery.

The formation of peroxide of lead on one of the plates continues indefinitely as long as the exciting current is maintained, becoming constantly slower as the metallic surface acquires an increasing protection against further action by the constantly increasing thickness of the coating of peroxide of lead. This coating is a good conductor of electricity, and free oxygen is evolved at the surface of the coating. Now, if the exciting current be stopped, local action, somewhat similar to that in galvanic batteries, commences between the peroxide of lead and the backing of metallic lead with which it is in contact. By this action, the peroxide is gradually reduced to a lower state of oxidation, while more of the metallic lead of the plate is oxidized by the oxygen thus made available. The fresh lead thus oxidized doubtless acquires the same condition of oxidation as the original protoxide finally assumes. But the peroxide is never by this action reduced to a state of protoxide, as is proved by the color of the coating and by the non-action on it of the sulphuric acid. When peroxide of lead is thus reduced to a state of lower oxidation, it becomes useless for the development of a secondary current until freshly charged or reoxidized. Thus is explained, as far as the oxygen plate is concerned, the cause of the gradual loss of charge observed in lead secondary batteries. Further, since the conducting power of peroxide of lead rapidly decreases as its oxygen is removed, the reason of the high electrical resistance of the oxidized plates, after long standing uncharged, is also explained. When a plate that has lost its original charge by local action is recharged by an electric current as at first, it will hold a larger charge than before, because all the lower oxide will be raised to the condition of peroxide, and thus more of the latter will be present than at the previous time of charging. This explains why the oxygen plates of secondary batteries constantly increase in capacity, even though the exciting current be applied at long intervals.

At the opposite side of the battery, hydrogen appears as the result of the charging current. This is absorbed at the surface, being simply occluded, or more probably forming a definite but feeble chemical combination with the lead. If such a combination exists, it is probably a stable one as far as local action is concerned. At any rate, the capacity of the hydrogen plate never becomes at all considerable when it is subjected to this action alone. Hence in practice the oxygen plate soon acquires the greater capacity, and the charge must be reversed to cause the oxygen to act upon the hydrogen plate to bring it into a spongy condition, in which it can retain an amount of hydrogen equivalent to the oxygen stored in the opposite plate. Thus it is the oxygen plate for the time being that receives all the improvement from the charging action, the hydrogen plate remaining almost unaltered. This is the reason for the frequent reversals of the charge in forming batteries. When a previously excited secondary battery is discharged, the peroxide of lead is thereby reduced to a state of lower oxidation, as already explained. Thus what was at first a good conducting envelope on the metal plate is now reduced to a poor conductor, while at the same time pure water is formed within the mass of lead oxide, and presents a further barrier to the passage of the current. These two causes account, so far as the oxygen plate is concerned, for the increase of resistance in secondary batteries during their discharge, and especially toward the end of the process. Water is also formed in the pores of the hydrogen plate.

The difficulties of forming batteries by this process arise from the fact that the coating of peroxide of lead on one of the plates necessarily occupies more space than the metallic lead did. The covering must then expand in all directions in forming; and to accommodate this, the structure of the deposit must be more or less broken up, or else the lead plate must expand. When the direction of charge is reversed, the previously expanded mass shrinks. Both the expansion and contraction may be rendered manifest by treating one side only of a plate, the other side being protected by varnish. When such a plate is oxidized, the exposed side becomes convex; and when the oxide is subsequently reduced, the same side becomes concave. During the processes of charging and reduction, the expansion and shrinking do not occur in all parts of the mass at once, hence a disintegrating action is set up, and the coating eventually peels off. Again, every time the deposit of lead is reduced, a notable quantity of sulphate of lead is formed within the mass, and exercises a very deleterious influence, stopping the pores, and aiding the disintegration by its superior volume.

The Büttgenbach System of Separating Blende and Pyrites.—We have repeatedly referred to Franz Büttgenbach's method of separating zinc-blende from iron pyrites as practiced at Lintorf, Westphalia. The separation of intimately intermixed minerals from each other has been effected hitherto mainly by taking advantage of differences of density, structure, or capacity for being rendered magnetic by calcination. Herr Büttgenbach makes use of the properties of minerals evinced in differences of cohesive strength. The separation of minerals of unequal hardness, by reason of their greater or less susceptibility to break down into fragments of different sizes, is not possible with the ordinary crushing or stamping mill; but it is different when the mass is thrown violently against a hard, resisting surface, in which case, if the velocity is properly proportioned, only the more brittle substances are broken. In order to obtain a proper separation of iron pyrites and zinc-blende, Herr Büttgenbach has been led to experiment on the use of Vapart's centrifugal breaker, not only as a crusher but as a separating machine. The ore is passed through it and is then simply screened. At a speed of 800 revolutions per minute, in the Vapart crusher, lumps of iron pyrites of from 20 to 25 millimeters diameter will leave it either as dust or grains of from 1 to 1½ millimeters; whereas, with 400 revolutions, they will come out of it but little touched. With 800 revolutions, however, zinc-blende is crushed to the finest dust: while with from 300 to 400 revolutions, it leaves the apparatus partly as dust and partly in grains of ½, 1, 2, and 3 millimeters. If, now, a mixture of pyrites and blende is put into the apparatus and passed through it at a speed of 400 revolutions per minute, the pyrites leave it in almost the same state in which they entered it, while the blende is very finely reduced, and the separation of the two minerals may then be easily effected by a simple sifting process.

THE GRANT SMELTING-WORKS.

Written for the Engineering and Mining Journal by O. J. Frost, Argo, Colorado.

(WITH SUPPLEMENT.)

The Grant Smelting-Works are situated about two miles from the central business portion of Denver, in the northeastern part of the city. They are the most recently erected and the largest silver-lead smelting-works in the country, as well as the combined result of a full knowledge of the best processes the world over and of an experience ripened by several years in the smelting of Colorado ores at Leadville.

The history of the Grant works furnishes a typical example of the growth of Western industries. When the extensive resources of Leadville were proved, the foundation of the present smelting establishment was laid by the erection of a single blast-furnace. From time to time, others were added, until, last spring, when the works were completely destroyed by fire, it was the foremost smelter in Leadville. It was desirable to rebuild at a more central point. After a careful consideration of the railroad facilities for the transportation of ore, and the abundance and quality of fuels and fluxes obtainable at various centers, Denver was chosen as best answering the requirements. The new works are owned by Eddy, James & Grant, Messrs. Eddie and James having bought an interest owned in the old works by Judge Grant, an uncle to Mr. J. B. Grant, the present partner. Mr. J. B. Grant is a metallurgist of both high theoretical and practical attainments, having supplemented an American college education by three years of study at the Royal School of Mines, Freiberg, Germany, to which has since been added his smelting experience at Leadville. At present, he is Governor of Colorado, having been elected last fall to that position. Messrs. Eddy and James are business men of wide and successful experience. The metallurgist is Dr. Malvern W. Iles, a graduate of Columbia School of Mines, who has gained a thorough knowledge of Colorado ores in his position of chemist for the former company at Leadville. A young man, he is an enthusiastic devotee of science, and to its records he has already made a number of valuable contributions.

The site chosen for the works was a terrace next the bottom of the Platte River. On one side, it affords facilities for the delivery of ore, fluxes, and fuels by the cars on a level with the charging-floor of the works, while it also gives an unlimited slag-dump on the other side from twelve to fifteen feet below the furnace hearths.

The works consist of a large brick building (represented in plan and section by Figs. 1 and 2 on accompanying plate) and an addition at the southwest end, not shown. This building is 230 feet long and 100 feet deep. The end walls are 22 inches thick, strengthened by four abutments, each four feet wide, which project two feet at the base, but at the roof recede to the level of the wall. The front wall is 13 inches thick, and has twelve eight-foot openings for easy access to the ore-bedding floor. Between these openings or doors, strengthening abutments project outward two feet, and inward 11 inches. The rear of the building is supported at the corners by two brick piers eight feet square, and between by eleven square iron pillars. The roof is of iron supported by truss-work. The front side of the building is taken up by the ore-bedding floor, which is of planks resting on timbers imbedded in the solid earth, furnishing an unyielding support for any weight of ore. Along the rear of the works are the furnace-floor and the feeding-floor. Between these floors and the ore-bedding floor, leading to the stack, is the dust-chamber. It is 6 feet wide and 15 feet high internally, and is built with 18-inch walls. The roof is arched, and the side next the ore-bedding floor is provided with a projection (*a*, Fig. 2). Access to the chamber is had from the furnace-floor by means of doors, one of which is represented in Fig. 2. The stack is octagonal outside, each side being 8½ feet at the base, but slightly tapering upward. The interior is square, 12 feet on a side, and is provided with iron bar straps. Its hight is 155 feet. The furnaces, eight in number, stand in a row on the furnace-floor at distances varying from 23 to 27 feet from center to center. They are numbered 1, 2, 3, 4, 5, 6, 7, and 8, each having a special name given it by the workmen. An additional furnace, 9, is in process of construction. It was originally intended to erect another, but the space for the tenth has been taken up by a tramway (represented in Fig. 1) for raising slag used as a flux. The furnaces are a rectangular modification of the Pilz Freiberg furnace, all being of the same construction. The automatic siphon-tap used is a distinguishing feature from the Pilz; another distinction is the use of ten instead of eight tuyeres. Like the Pilz, the slag is tapped through a tap-hole in the closed breast. The lower portion of the furnaces is provided with water-jackets, and the fumes are conducted by a flue leading from the upper portion of each furnace to a dust-chamber and thence to a common stack. On the furnace-floor next the dust-chamber is a tramway for removing the bullion to cars on the broad-gauge track (railroad, Fig. 1) by which it terminates. In front are two narrow-gauge tracks (*r r*, Fig. 1), from which the ore is bedded. Several other tracks, not represented in the plan, lie farther in front. A switch-engine owned by the company is in use for convenience in handling the cars. At the ends of the building are dumps of charcoal, coke, and limestone, four furnaces being furnished with these materials from each end. The addition mentioned above at the southwest end contains the engine, blowers, and electric light machine. The assay-office and the general office are each in a separate building to the front of the works proper.

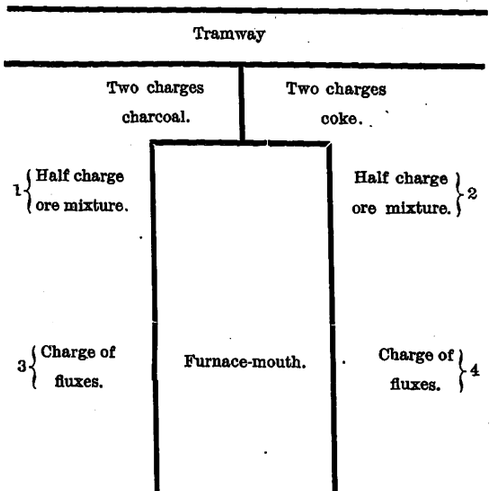
The details of the construction of a furnace are as follows: The hight from the furnace-floor to the upper surface of the charging-floor is 18 feet 2 inches. The hearth or crucible, 30 inches in hight, is built of fire-brick, without tamping, and is inclosed in cast-iron plates 1¼ inches thick. The brick-work is underlain by a plate of boiler-iron, to prevent any molten lead which penetrates the brick getting beyond the limits of the hearth. The hearth is 10 feet long and 6 feet 3¾ inches wide externally. The hearth cavity (*b*, Figs. 5, 6, and 7) is 80½ inches long and 36 inches wide at the top, but one foot smaller each way at the bottom. Its depth is 22 inches. The automatic tap consists of a retangular passage left in the brick-work of the hearth, leading from one side of the hearth cavity to a small lead well (*c*, Figs. 5 and 7) in the upper portion of a column of fire-clay, inclosed in sheet-iron, which is bolted to the cast-iron hearth-plates. The water jackets (*e, e, e*, etc.) are 3 feet 5 inches high, 6 inches thick, and are cast in fifteen pieces—five on each side, two on the back, and three on the front end. They are hollow shells of cast-iron five eighths (⅝) of an inch thick. They rise on a line with the hearth cavity, 18 inches to the boshes, then slant outward 6 inches in the remaining 23. On the outside of each jacket, 17½ inches from the bottom, begins a projection (*f, f*, etc.) 8 inches wide. It runs 3 inches above the top of the jacket and extends at the upper portion 4 inches. It gives on the interior a channel (*f'*, Fig. 7) for the entrance and exit of water. Water is supplied cold to the interior (*e'*, Fig. 7) of the jackets by means of the small pipes (*h, h*, etc., Figs. 3, 4, and 7), one to each casting of the jacket. These pipes branch from a supply-pipe (*g*, Figs. 3, 4, and 7) running around the furnace, which in turn is itself a branch of the main delivery-pipe (*x*, Fig. 4). The heated water runs out at the openings *i, i*, etc., into galvanized iron troughs (*j, j*, etc). From these troughs the water is conducted by a cast-iron water-pipe (*k*, Fig. 4) to a common pipe for waste water beneath the furnace-floor. Although the entrance orifice is near the exit, no special device is needed to keep the water mixed, simple connection being sufficient to maintain a uniform temperature. At the front end of the furnace, the water-jackets are so cast as to leave room at the middle for a breast (*l*, Figs. 3 and 6) of fire-brick, 5½ inches high and 16 inches long. The tap-hole (*m*) for slag is in the lower portion of this breast. Above it is a small jacket (*n*), 9 by 16 inches, for the front tuyere. The tuyeres (*o*) enter the furnace 8 inches above the hearth. They are of brass, fitting the openings in the jackets closely, 4 inches in diameter at the outer end and 3 inches at the inner. Their axes are horizontal. The blast-pipes are of galvanized iron above and below (*p, p*, etc.) with strong, closely woven canvas bags, soaked in silicate of soda, connecting them with the tuyeres (*q*). They branch from the blast-main (*r*) for each furnace. This itself branches from the common blast-main (*s*, Fig. 2). At the tuyeres, the internal dimensions of a furnace are 80½ by 36 inches. A furnace of larger size was built in Leadville at the old works; but it was found not to work well, on account of a wedge of ore in the center of the furnace which the blast did not reach. The shaft of the furnace is 12 feet 3 inches above the water-jackets. It is common brick, lined with fire-brick. The brick-work is supported by a cast-iron collar or supporting-plate (*t, t*) extending around the furnace, and resting on the tops of four iron pillars, one at each corner. Arches in the common brick from corner to corner give strength to the shaft. The shaft is bound by five tie-rods on each side and end, secured in vertical castings at the corners. A round sheet-iron flue (*v*, Figs. 2, 4, and 6), 30 inches in diameter, conducts the fumes downward into the dust-chamber, as shown in Fig. 2. The charge is introduced through a rectangular sheet-iron curtain (*w*, Figs. 3 and 4), 34 by 70½ inches. It leaves a space covered over tightly with sheet-iron, 12 inches wide on the sides, and 16 inches on the ends, not filled by ore, into which the fumes rise before passing down the flue. At the front end of the furnace for conducting away the fumes rising from the slag at the time of tapping, is a sheet-iron hood (Figs. 2, 3, and 4). Its stack slants forward in the lower portion to the shed, through the roof of which it rises vertically.

The power for the works is supplied by an eighty-five foot horse-power Corliss engine, made by Fraser & Chalmers, of Chicago. It drives the blowers, runs the pumps, works the electric light machine, and raises slag to be mixed with the charge for flux.

The blowers are Baker's rotary pressure, No. 7½. The works are provided with three, two being in constant use, and the third in reserve. They supply the blast to the furnaces by the blast-main (*s*, Fig. 2), 3 feet in diameter, made of galvanized iron, running the length of the furnace-room next the dust-chamber. At present, cold blast is used; but it is proposed to heat it by changing the position of the main to the inside of the dust-chamber. The blast-pressure is denoted by Wilbraham mercury-gauges, one to each furnace.

There are two pumps to supply water to the jackets, engine, and other needs of the works. One pump only works at a time; the other is in reserve in case of breakage of the first. The water is pumped into a large tank outside the works above the level of the water-jackets. From this tank, it is supplied to the furnaces by means of the 6-inch iron water-pipe (*x*, Fig. 4) running the length of the works in front of the furnaces.

Light is furnished by Weston's electric light machine. There are ten lights distributed to perfectly light the dumps outside as well as the inside of the works. All the rest of the iron-work and machinery was furnished by the Colorado Iron-Works, of Denver, Colo.



At least seven tenths of the ore smelted is carbonate ore from Leadville. The rest comes from various other parts of Colorado, as well as from New Mexico, Arizona, and Idaho. Previous to smelting, the ore is mixed on the ore-bedding floor (Figs. 1 and 2). It is wheeled on to the bed with barrows run on planks which are shifted as the bed rises. The ore is spread in layers covering the whole bed, each layer being of uniform thickness throughout, but different layers varying in thickness with the mineral character of the ore as determined by chemical analysis, and its richness as determined by fire-assay. A bed, when finished, is five or six feet high, and contains from six hundred and fifty to eleven hundred and fifty tons. In richness, the beds range from 17 to 40 ounces in silver, and from 16 to 22 per cent in lead. The charge consists of ore, 500 pounds; limestone, from 75 to 100 pounds; slag, from 60 to 70 pounds; coke, from 60 to 80 pounds; charcoal, from 30 to 50 pounds. The ore is shoveled from the bottom of the ore-bed, the upper layers falling to the floor and mixing well, into iron barrows or "ore-buggies," weighing 75 pounds each. The barrows, when loaded with about half a charge, are run on to the ore-scales, an exact half-charge is weighed by adding or throwing off ore, and the ore is then wheeled to the mouth of the furnace and dumped on the charging-floor. There are two pairs of ore-scales, one of the Howe and one of the Fairbanks make. Each scale has several beams which may be set and locked out of sight of the workmen, and the ore weighed on any one of them as set, without the trouble of changing weights—insuring both secrecy and accuracy.

The limestone used as flux is from near Morrison, Colo., and is of a very pure variety, as shown by the following analysis: $CaCO_3$, 94–96 per cent; SiO_2, 1½–2½ per cent; $Al_2O_3+Fe_2O_3$, 2½ per cent; $MgCO_3$, trace; organic matter, trace. The use of magnesian limestone is particularly avoided. The limestone, first crushed into moderately small pieces, is brought in iron "flux-buggies," weighing 65 pounds each, to the flux-scales, where the charge is weighed, and then the charge of slag is added from a pile that has been elevated from the slag-dump by the tramway, Fig. 2. The fluxes (a full charge) are then

Digitized by Google

dumped on the half-charge of ore at the mouth of the furnace, after which another half-charge of ore is dumped on the fluxes. The fuels, coke and charcoal, are brought on a tramway (*y*, Fig. 2) from the dumps outside the works, and weighed on appropriate fuel-scales before dumping at the furnace-mouth. The coke used is from the coke-ovens of El Moro, Colo. The charcoal comes from Selida, Colo.

The following diagram will clearly represent the method of charging:

(The figures denote the order in which the materials are brought.) In charging, the "feeder" first spreads half the pile of charcoal (or one charge) on the top of the furnace; next, half the pile of coke; and lastly, he adds the ore and fluxes dumped on one side of the furnace-mouth. He then repeats the process, keeping the mixture of ore, fluxes, and fuels a little above the bottom of the curtain (*w*, Figs. 6 and 7). In regular working, no smoke or fumes come out of the mouth of the furnace, the draught being strong enough to convey them all down the flue to the dust-chamber; but for extraordinary cases, such as repairs to the dust-chamber or the common stack, each furnace is provided with a counterpoised stack of sheet-iron (Fig. 2). When needed, it can be instantly lowered to the furnace. On each side, it has an opening (*z*) for feeding. A damper in the flue of each furnace serves, when desired, to turn the draught from the dust-chamber up each furnace-stack. The damper can also be regulated so as to turn off one half or one quarter of the draught. The amount of blast used is regulated by a slide in the branch blast main to each furnace. The pressure varies from seven to ten ounces per square inch. The supply of water to the jackets is regulated by a screw cut-off in the pipes *h*, *h*, etc. The surface of the lead in the well is kept just below the top. It stands higher in the well than in the hearth or crucible, by the amount of blast used. The molten lead is dipped by the "furnace-man" and cast into bars of bullion weighing from 107 to 108 pounds. Two chips —one from the bottom and one from the top—are taken from each bar of bullion, for assay. The bullion runs from 100 to 200 ounces of silver and from 0·25 to 4 ounces in gold. It is shipped in car-load lots of 220 bars each to the Omaha Refining Company, where the precious metals are extracted from the lead by Balbach's modification of Parkes's process.

The slag is tapped in the ordinary way by the "slag-tapper" breaking the clay plug to the tap-hole with an iron bar. It runs into an iron slag-buggy standing under the spout; and when the outer portions solidify, it is drawn out by the slag-tapper and tipped over the dump. The nature of the slag is regulated by the price of fluxes and the requirements of the silver and lead markets; but none of it ordinarily needs re-smelting, except what is added to the charge as flux. From 55 to 65 pots or buggies of slag, weighing 270 pounds each, are tapped from each furnace per shift of twelve hours. A series of experiments on the specific gravities of the slags was conducted for a number of years at the old works in Leadville, without arriving at important metallurgical data. These experiments have now been discontinued.

Daily and nightly furnace reports are made, giving the following data:

GENERAL REPORT—GRANT SMELTING COMPANY.

The dust deposited in the dust-chamber is mixed with 8 per cent of caustic lime and re-smelted, either first mixing on the ore-beds or adding directly a shovelful to each charge. (Rich grades of ore are also mixed with 8 per cent of caustic lime before spreading on the ore-beds.) The dust from all portions of the chamber contains bromo-chloride of lead—a compound first discovered by Dr. Iles when chemist at the old works in Leadville. The metallurgical importance of the addition of caustic lime in re-smelting depends upon a double decomposition between the caustic lime and the bromo-chloride of lead. The probable furnace reaction is as follows: $PbBrCl + Ca(OH)_2 = Pb(OH)_2 + CaBrCl$.

The projection *a* in the dust-chamber gives the fumes a whirling motion and largely confines the draught to the upper portion, so that, together with a careful regulation of the dust-chamber doors, a stratum of pure air is left below in which combustion of carbonaceous matter takes place, concentrating the flue-dust and making it less disagreeable to handle. The flue-dust is removed from the chamber in barrows, the assay sample being obtained with a Spitz divider from every tenth barrow. A sample from eighty-one (81) tons—the dust deposit of the first four months' run—carried 32 ounces of silver to the ton, a trace of gold, and 26 per cent of lead. The roofs and windows of all adjoining houses have been examined for flue-dust and none has yet been detected. Some, however, has been found on the sheet-iron roofing of the smelter itself. It contained but one ounce of silver to the ton, and singularly, but a trace of lead.

Speise and matte are occasional products, and are saved in one large pile. A sample of 1800 pounds taken from all portions of the pile run 30·75 ounces of silver to the ton, a minute trace of gold, and 9 per cent of lead. None of it has yet been treated. It will probably be roasted in a reverberatory furnace before re-smelting.

The men work in twelve-hour shifts. Every two weeks, at noon, the shifts change from night to day. This bi-weekly change of shifts at midday gives opportunity to shut down the engine and make any needed repairs in the shortest possible time, as all the force is at hand to help at the time when the light is best. The number of men employed about the works is 130, as follows:

8 furnace-men to each shift	16	Cart-men	3
8 slag-tappers " "	16	Cart-helpers	2
8 feeders " "	16	Roustabouts	3
8 ore-wheelers " "	16	Flue-dust men	2
4 flux-wheelers " "	8	Speise man	1
2 fuel-wheelers " "	4	Blacksmith	1
Total about 8 furnaces	76	Carpenter	1
1 weighing-master to each shift	2	Bullion-loaders	3
1 engineer " "	2	Foremen	2
1 fireman " "	2	Bookkeepers	2
Ore-bedders (day)	15	Assayer, chemist, and metallurgist (each)	3
Ore-bedders (night), or relay night men.	5		
Timekeeper	1		130
Unloaders of fuel	4		

Construction of the works began in July, 1882. They were completed so that the furnaces were blown in as follows:

No. 1	October 7th, 1882.	No. 5	October 12th, 1882
" 2	" 10th, "	" 6	" 15th, "
" 3	" 11th, "	" 7	" 28th, "
" 4	" 10th, "	" 8	November 1st, "

The eight furnaces smelt from 211 to 250 tons of ore a day, 230 being about the average. This makes the actual working capacity up to date, of a single furnace, a little less than 30 tons. The production up to January 1st, 1883, here follows:

State or Ter.	Gold.	Silver.	Lead.	Totals.
Colorado	$27,900	$617,200	$533,000	$1,178,100
Arizona		123,000	3,000	126,000
New Mexico	20	10,000	600	10,620
Idaho		500	200	700
Other sources	1,500	16,000	4,300	21,800
Totals	$29,420	$766,700	$541,100	$1,337,220

The writer is under obligations to Dr. Iles, superintendent of the works, who was very kind in imparting information and considerate in offering facilities needful in collecting the material for the foregoing paper. He is also indebted to Mr. Nasmyth, of the Colorado Iron-Works, where the water-jackets were cast and all other iron-work for the smelter, roofs, etc., included, was manufactured, for information regarding the construction of the water-jackets.

IT is announced that a syndicate of capitalists in this country has purchased the patent for the Bull direct process of iron manufacture in this country on a favorable report made by Herr A. Hansen, of Dortmund Germany.

COAL RAISED IN THE UNITED KINGDOM IN 1882.—It appears that the quantities of coal brought to bank in the United Kingdom last year reached no less a quantity than 156,500,000 tons, thus exceeding the extraordinary production of 1881 (154,184,000 tons) by upward of 2,300,000 tons. As compared with 1880, the excess is as much as 9,700,000 tons, and as compared with 1879, it is 12,500,000 tons. This shows a progressive expansion in the production of coal that is really startling. The miners employed in the production of this mass of fuel numbered 501,000, so that each man, on the average, won 312 tons in the course of the year.

LIGHT GOLD COIN.—At a meeting of the British Institute of Bankers, a paper on light gold coin was read by Mr. R. H. Inglis Palgrave. Recent inquiries into the condition of the gold coinage of Great Britain showed that about eighteen years' wear would render a sovereign illegally light, and that 55 per cent of the gold coins now circulating were below the legal currency. The amount of English gold coin in circulation Mr. Palgrave estimated at about £100,000,000, the estimated cost of recoining which would be £786,000. Withdrawal of light coin must, he argued, proceed side by side with the issue of the full-weight coin, and the cost must necessarily fall either on the government or on the last holder of the coin. If the charge were to fall upon the last holder, injustice would be done, because the circulation of light gold was unequally divided over the

Digitized by Google

whole of the country; and Mr. Palgrave considered that the most desirable method of withdrawing the light coin would be by the government, acting through the Bank of England, exchanging light coins for new ones of full weight under certain conditions, including an allowance for maximum wear on each parcel, which would increase according to the age of the coin. A short discussion followed, in which the balance of opinion coincided with the views expressed in the paper.

WEIGHT OF ANTHRACITE COAL.—Mr. Heber S. Thompson, Engineer of the Girard estate, has been at some pains to ascertain the weights of anthracite coal in place. Samples were secured from the Mammoth, Seven-Foot, and Buck Mountain seams at the Kehley's Run colliery, and having been formed into perfect cubes, they were weighed on accurately adjusted scales. The weight of a cube containing 100 cubic inches having been ascertained, the weight of a cubic yard was simply a matter of calculation. The following results were obtained:

Mammoth Seam: 102 pounds per cubic foot and 2754 pounds or $1\frac{33}{800}$ tons of 2240 pounds per cubic yard.

Seven-Foot Seam: $99\frac{66}{100}$ pounds per cubic foot and $2688\frac{30}{100}$ pounds or $1\frac{30}{100}$ tons of 2240 pounds per cubic yard.

Buck Mountain Seam: $103\frac{68}{100}$ pounds per cubic foot and $2799\frac{36}{100}$ pounds or $1\frac{35}{100}$ tons of 2240 pounds per cubic yard.

Mr. Thomas proposes to find the weight of the coal in place in all the collieries on the Girard estate.

A REMEDY FOR BURNS AND SCALDS.—It is now many years ago, says Mr. F. Peppercorne, in the *Popular Science Monthly*, while engaged in some investigations as to the qualities and effects of the alkalies in inflammations of the skin, etc., that he was fortunate enough to discover that a saline lotion, or a saturated solution of bicarbonate of soda in either plain water or camphorated water, if applied speedily, or as soon as possible, to a burned or scalded part, was most effectual in immediately relieving the acute burning pain; and when the burn was only superficial or not severe, removing all pain in the course of a very short time; having also the very great advantage of cleanliness, and, if applied at once, of preventing the usual consequences—a painful blistering of the skin, separation of the epidermis, and, perhaps, more or less of suppuration. For this purpose, all that is necessary is to cut a piece of lint, or old soft rag, or even thick blotting-paper, of a size sufficient to cover the burned or scalded parts, and to keep it constantly well wet with the sodaic lotion so as to prevent its drying. By this means, it usually happens that all pain ceases in from a quarter to half an hour, or even in much less time. When the main part of a limb, such as the hand and forearm or the foot and leg, has been burned, it is best, when practicable, to plunge the part at once into a jug or pail, or other convenient vessel filled with the soda lotion, and keep it there until the pain subsides; or the limb may be swathed or encircled with a surgeon's cotton bandage previously soaked in the saturated solution and kept constantly wet with it, the relief usually being immediate, provided the solution be saturated and cold. What is now usually sold as bicarbonate of soda is what he has commonly used and recommended, although this is well known to vary much in quality according to where it is manufactured; but it will be found to answer the purpose, although probably Howard's is most to be depended on, the common carbonate being too caustic.

EXTRACTION OF PRECIOUS METALS BY ELECTROLYSIS.—In a recent number of the *Chemical News*, Messrs. Blas and Miest described several methods for the extraction of the precious metals from all kinds of ores by electrolysis. The following abstract of this paper was given in the *Journal* of the Chemical Society for January: "The authors have discovered that if, in electrolysis, compressed ores are used as anode in a bath of an electrolyte containing the same metal as the metal of the ore, on the passage of the current the ore is decomposed, the sulphur, etc., being precipitated at the anode, while the metal collects at the cathode. Thus, with pure galena in a lead nitrate bath, the separation is complete and easy. If the ore contains silica as well, then the silica remains at the anode. Antimony and arsenic, if present, behave in a similar manner, being precipitated as insoluble oxides. They are easily separated by a subsequent electrolysis. When large quantities of arsenic are present, a part of it combines with the sulphur, and forms realgar or orpiment. When ores containing several metals are operated on, the precious metals, being most easily precipitated, are thrown down first in the metallic state at the cathode under the action of a moderate current. The final separation of these metals requires very little battery power; for the mass of metal, when dissolved under the action of the current, regenerates sufficient heat for the ulterior separation of each metal separately. The products at the anode are extracted and purified by treatment with carbon bisulphide, and afterward by separate electrolysis. The decanted carbon bisulphide solution of sulphur is distilled, the latter being left pure. If the ore is a polysulphide, and is mixed with much iron, sulphur and iron oxide are obtained in the first operation. These are best separated by electrolyzing in a dilute sulphuric acid bath; pure sulphur is obtained at the anode, and basic iron sulphate at the cathode. By this process, 1¼ horse-power is required to produce one kilo of copper from a sulphurous ore in one hour. As an example of the working with a complex ore, they describe the treatment of an argentiferous lead ore containing iron, copper, and zinc. The current being sufficiently strong, the iron and zinc will dissolve as readily as the other metals, but will not be precipitated so easily, therefore the solution will gradually become saturated with iron and zinc; the current is then regulated so that only the lead, silver, gold, and copper are precipitated on the cathode, while the zinc remains dissolved as nitrate. As the bath becomes saturated, the iron yields to the zinc, and is precipitated to the bottom as ferric oxide, and as soon as the solution is nearly saturated with zinc nitrate, it is siphoned off; the metals are then removed from the cathode, the sulphur and silica from the anode, and the iron oxide from the bottom, of course all separately. The sulphur, etc., and the metals are treated as above described. The zinc nitrate solution is treated with a small quantity of zinc oxide, which throws down the iron; the lead, copper, and silver retained are precipitated by passing a current through the solution, using a zinc anode. The pure zinc nitrate may be treated by a stronger electric current if metallic zinc is required, or if chemically, zinc oxide is wanted."

FURNACE, MILL, AND FACTORY.

The Phosphor-Bronze Smelting Company, of Philadelphia, has improved the quality of its wire recently, by obviating the tendency to kink. It is remarkable for its resistance to the corrosive action of smoke, acid fumes, or mine water, is claimed to possess a tensile strength equal to four times its weight per mile, which is 40 pounds for No. 18 gauge, or 0·049 inch diameter. Mr. W. D. Sargent, electrician, reports its electrical resistance to be about one half of that of iron wire of equal weight.

The heaviest iron ever worked in the Trenton rolling-mill was turned out recently. It consisted of two 15-inch girders, each weighing 4100 pounds before being charged. Twenty-two men were required to put them in the furnace, and double that number to roll them. When taken from the furnace, the girders measured each 54 feet long.

Benjamin, Fischer & Mallery's new works at South Chicago are completed and in operation. The main building is 210 feet long by 55 feet wide, and two stories high. The foundation is 48×102, with cupola outside having a capacity of thirty tons a day. The blacksmith-shop is 40×40, and contains four fires. The power for the works will be supplied by a 40 horse-power Atlas engine and a 60 horse-power boiler. From 150 to 200 men will be employed.

Several very important decisions were reached at the recent meeting of the stockholders of the South Tredegar Iron and Nail Company. The mill, after being considerably enlarged, will be run day and night. One thousand hands will be employed. Great improvements are destined to take place in the nail department, and 1200 kegs of nails, 500 kegs of spikes, and 100,000 pounds of splice bars will be the daily output. These enlargements will doubtless result in the building of a blast-furnace near the plant very soon.

It is said that the old Otis Tube-Works, Cleveland, O., will be started up as a branch of the National Tube-Works Company.

It is said that a stock company is soon to be formed which proposes erecting a large rolling-mill just east of Winooski, Vt.

A citizen of Connellsville, Pa., has offered to furnish any manufacturing company that will locate there a sufficient number of acres on which to operate its works. It is also understood that another property-owner will make a like offer.

A Hartford concern has recently received an order for a self-steering, traction, portable steam-engine, with a portable circular saw-mill, to go to Antuco, Chili. It is also negotiating for the shipment of a similar engine to Australia.

The Harlan & Hollingsworth Company, Wilmington, Del., has cast a condenser weighing 17,000 pounds, for the steamship Pensacola, now building at its yard.

Henry Disston & Sons, manufacturers of the Keystone saws, tools, etc., report consumption of raw materials for the year 1882, at their principal works at Philadelphia, as follows: 21,000 tons of coal and 10,000,000 feet of lumber. They made and worked into edged tools 80 tons of steel per week, besides 450 tons of bar steel for files. They turned out 1,692,000 single saws, 3810 large and 39,000 small circular saws, 1,250,000 long saws, 201,509 dozen files, besides a large quantity of miscellaneous tools which were made in the jobbing department. In this establishment are employed 1300 men, whose aggregate wages amount to over $18,000 per week.

George Felber, of St. Louis, manufacturer of machinery, is furnishing the St. Joe Lead Company, Bonne Terre, Mo., with eccentric jigs, screens, tanks, etc., for its new works now building. He is also doing considerable repair work for the same company.

D. M. Dillon, boiler-maker, Fitchburg, Mass., is making a five-foot steel tubular boiler for Lee, Blackburn & Co., woolen manufacturers, of Lawrence, Mass. This boiler will be set with the Jarvis patent furnace, and use the Sheffield grates, burning screenings and soft coal for fuel.

A combination has been formed in the South, composed of all the coke iron furnaces in the States of Tennessee, Alabama, and Georgia, with the exception of the Oakdale (Tenn.) furnace, to be known as the Southern Coke Association. The object of the association is to obtain and maintain a uniform scale of prices, and prevent indiscriminate competition. A uniform scale of prices has been agreed upon, and agents are required strictly to abide thereby, allowing concessions to no one, no matter how large his order for iron may be. It places all brands of iron on the same platform, so that the furnace making an iron of low standard will get the same price as for the high standard.

The latest achievement of the great 17-ton steam-hammer at the Black Diamond Steel-Works of Park, Brother & Co. was the manufacture by it of a large roll for the sheet mill, the ingot weighing about seven tons. This is said to be the first hammered roll ever made in this country. Heretofore they have been cast.

Alfred Box & Co., Philadelphia, have completed and put in operation in their works an exceedingly ingenious and successful special milling machine, which cuts the threads in the concave screw pinion used in the Box patent screw hoists. The arrangement of this machine is so perfect that, without any changes, save of motion and adjustment, any of the various sizes of pinions may be cut with equal facility. Both the cutter-shaft and shafts revolving the pinion have a separate and positive motion. The cutter-shaft has an automatic feed with a stop motion when the proper depth of cut has been made.

The new vitriol works erecting at St. Louis will produce daily about 300 barrels of copperas, sulphate of copper, and sulphate of zinc. The raw materials used will be the waste acid products from the Harrison Wire-Mills, together with wire and sheet scrap, which have heretofore been counted worthless, but which, under a new system, will be turned into a product worth about $100,000 annually.

The resumption of operations at the rail-mill of the New Jersey Steel and Iron Company, at Trenton, N. J., gives work to about 150 men. Several hundred men in other departments of the mill will continue idle till the puddlers resume work.

The capacity of the Henry Clay Furnace, at Reading, Pa., has been increased from 150 to 200 tons, by raising the furnace twelve feet. It has been blown in.

The Alton Rolling-Mill Company, Alton, Ill., has been incorporated; capital stock, $25,000. The incorporators are James T. Drummond, Charles H. Randal, James W. Kerr, John Haynod, Frederick W. Drury, and W. Pierce.

The union men locked out of the Vulcan Works at St. Louis, think that they will ultimately win. All of the Indianapolis men brought on to St. Louis have returned, and the union men seem confident that they can keep others away.

The Lanesboro' (Mass.) iron furnaces, which have been lying idle awaiting the decision of Congress on the tariff, are to be started up.

Among the recent improvements at the Girard furnace is a new hot-blast, large steam cinder crane air-hoist for lowering and raising the bell, and an addition to the casting-house. It is expected the furnace will have a capacity of 120 tons per day.

The Mahoning Valley Iron Company this week placed in operation one of Caddick & Co.'s patent puddling-furnaces. It is claimed for this furnace that there is a saving of 40 per cent in fuel used over the old furnaces, that the iron is improved, and but a small amount of scrap used.

The Edgar Thomson Steel Company is testing the limestone on Isaac Sherrick's farm, two miles northeast of Mount Pleasant, with a view of purchasing the farm. A $82,000 blowing-engine is building in Milwaukee, Wis., for the works of this company.

During the month of February the Aurora, Ill., smelting-works received thirty-one cars of bullion from the mining regions, and thus far this month their average receipts have been four car-loads daily.

Digitized by Google

GENERAL MINING NEWS.

ARIZONA.

The latest dispatches state the following: The jury has disagreed in the suit of the Knoxville against the Christmas Company.

BENSON.—The smelter has been running steadily for some time on ore from the Santa Rita Mountains.

TRANQUILLITY.—It is said that a body of $400 ore was struck in the mine recently.

CALIFORNIA.

SIERRA COUNTY.

BALD MOUNTAIN EXTENSION GRAVEL MINING COMPANY.—A telegram from Forest City, Cal., says: This company has struck gravel in its tunnel, with the channel well defined and extending up the ridge northeasterly. This is regarded as very favorable to the region, as there is no doubt a great extent of unworked channel in that direction underlying the deposits of lava.

CALAVERAS COUNTY.

HOOSIER.—The mill started up last week, and after a short run, a clean-up was made which far exceeded expectations. The rock which was crushed was taken from the dump as it came, and yielded $7 per ton. This was considerably more than it was calculated the rock would pay.

ROUGH DIAMOND.—Some more gravel was struck in this mine in Chili Gulch. Twenty-three car-loads were put through the mill recently, which yielded $2 to the car-load. This gravel was near the rim, and was extracted with greater facility than a great deal of the other which requires farther transportation to get it to mill.

INYO COUNTY—BEVERIDGE DISTRICT.

ELGIN.—This mine is situated eight miles north of the Keynot mine, and about sixteen miles from Independence. No work of any consequence had been done on the claim until a short time ago, when operations began. The vein is favorably situated for working both the mine and ore, being within one and a half miles of plenty of water and wood. The ledge shows itself on the surface for a distance of 1000 feet, and at the point where work has been commenced, the vein shows a width of three feet of rich gold quartz. Average samples assayed give from $80 to $120 per ton in gold.

GOLDEN STAR.—The shaft has reached a depth of 100 feet, showing a fine vein of ore in the bottom, twenty inches wide. It is the intention to sink 30 feet more, and then begin drifting on the ledge. The ore will be hauled and worked at the Brown Monster mill. Three average assays made lately gave, gold, $77; silver, $43 per ton.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended March 10th shows: Tons of ore crushed, 138·78; average assay value of pulp, $41.65 per ton; of tailings, $4.87. The east cross-cut, 1000 level, is 280 feet long. The inflow of water is unchanged, the pumps making about 8¼ strokes per minute. North drift, 800 level, is 277 feet long. A small station 5 feet deep was cut out on the west side, in which to place a fan to supply air to the men in this shaft. South drift, 770 level, is in 57 feet. From winze No. 6, at the 672-foot level, a drift was started on the 3d instant, to open another block of ore between this and winze No. 9, lying about 70 feet north. The drift has advanced 14 feet, and is opening up some good ore.

STANDARD CONSOLIDATED.—The official report for the week ended March 10th shows: East cross-cut, 1000 level, in 1256 feet. South drift from east cross-cut, 700 level, in 534 feet, showing the vein 3 feet wide. The west cross-cut from north drift is 92 feet long, and is in hard blasting rock. North drift No. 1, 500 level, is in 540 feet; the vein is 12 feet wide. The total length of north drift from south uprise No. 1 is 86 feet, and the vein is 7 feet wide. South drift No. 2, 385 level, is 349 feet long, and shows the vein 5 feet wide. Uprise No. 4 has reached a hight of 101 feet, where the vein is 6 feet wide.

SYNDICATE.—The east and west workings have been connected, and the mill will start up on the 24th for a long run.

CANADA.

NOVA SCOTIA.

The report of the Inspector of Mines has been presented in the House of Assembly. It shows that the total yield of gold during the year was 14,107 ounces 3 pennyweights 20 grains, against 10,756 ounces 18 pennyweights 2 grains during the preceding year. This is the largest yield since the year 1871, except during 1877, when production rose to 16,882 ounces. Discoveries of copper ore were reported from Malagash, Digby, and Dalhousie, and some prospecting was done at Seal Island, Bras d'Or, and St. Ann's, C. B. The mines of the Steel Company of Canada, at Londonderry, were kept in full operation during the summer. The No. 7 level has opened up a valuable range of ore. In the West mine, in Cumberland, and in the Cook's Brook mine, a small extraction of ore was made. Some ore was also taken from the North vein. A compact red hematite of good quality was found near the village of Maitland, and at several points farther west. Specular iron ore is reported to have been found at Roman Valley, Guysboro'. The Crane Iron Company, of Philadelphia, has taken out 3000 tons of ore from its mine at Salmon River Lakes, Guysboro'. At present, the best means of transporting ore to a good shipping place in Chebucto Bay is under consideration, and mining has been stopped. The ore is said to be of good quality, and the deposit appears to be of unusual size. The work, so far as carried on, has proved that the lead is from 25 to 35 feet wide, and that these dimensions hold good to a considerable depth.

COLORADO.

BOULDER COUNTY.

THE TELLURIDE ORES.—A reliable correspondent sends us the following: The most extensive district where mineralized veins of rock carry these kinds of ores, so far as known, is located in Boulder County, Colo., with the vicinity of Gold Hill as its discovery place and approximate center. The location of this town is upon a divide between Left-Hand Creek on the north and Four-Mile Creek on the south, the former an affluent of St. Vrain's, and the latter a branch of Boulder Creek, into which it merges three miles above Boulder City, and nine miles from Gold Hill by the water-grade road down Gold Run ravine. Boulder City is located at the base of the Rocky Mountains, on Boulder Creek, at an elevation of 5600 feet above the sea. Gold Hill is within fifteen miles of the summit of the Rockies; elevation, from 8600 to 9300 feet.

The mineral veins or lodes have a general trend from northeast to southwest, while the main chain of mountains runs nearly south. Some lodes run nearly east and west, carrying iron pyrites and free gold. Three very heavy lodes run nearly north and south across this belt, at intervals of three or four miles, and are charged with silver ores, such as gray copper and antimonial silver. Tellurides are mainly found in chimneys of from 30 to 200 feet in length, in the southwest veins mostly, accompanied with seams of pyritous iron and a sparry or hornblende gangue; indeed, softer hornblende is a main characteristic of all telluride veins, especially in surface rock or blossom.

The geological formation is mostly granite, though there are some rich telluride veins in the gneiss or serpentine. The old red sandstone lies from one to two miles within the east border of the mountains, and from thence westerly there is a north and south belt of granite in this county over six miles wide, reaching to the town of Gold Hill. Farther west, the serpentine sets in for about six miles, when another body of granite begins, reaching to and over the mountain summits. The veins in the main range granite carry galenas, native silver, gray copper, etc. The first of the large cross-veins, going westerly, crosses Gold Hill along the west border of the granite, and is known as the Hoosier, though there are many locations upon it, one of the best being the Yellow Pine, on the divide between Four Mile and Boulder creeks—a great chimney of $600 ore in gray copper form. Some of the telluride veins cut through this cross-vein: it is not known yet whether all the strong ones do. But few of the southwest lodes pay after passing west into the gneiss; and where they do, the veins carry silver largely, and less gold. The camp called Magnolia, six miles south-southeasterly of Gold Hill, at the apparent south end of the Hoosier vein, and south of Boulder Creek, has many rich telluride lodes, mostly in gneiss, while there are several more such veins near Boulder Falls and around Sugar Loaf Mountain, five or six miles west of Magnolia, also in gneiss. Again, the John Jay, Last Chance, and Smuggler lodes, from five to eight miles north of Gold Hill, rich in tellurides, are also in gneiss, as are the Bondholder, Prince, and some others two miles north. The Golden Age, however, and contiguous veins beyond the Seltzer Springs at Jamestown, and others near those springs, are in granite; likewise, the numerous lodes at Sunshine and at Salina, and others down within four miles of Boulder City, quite as rich as any. This mineral belt at present extends about fifteen miles in length by from six to eight in breadth.

There are probably not less than three hundred mineral veins in this belt that carry telluride ores: about one third of them have been patented. Hardly a week passes during the summer season but some old, worthless vein, by such gradual development as its owners are able to bestow upon it, proves up its worth by a showing of rich telluride ores; not in one particular camp in this belt, but in different portions, showing that what is wanted to make it one of the best localities for investment in the country is capital judiciously spent in developments. There have been, during the past twenty or more years, a few men of means here, on flying visits of a day or two; but very few came with any intention of careful examination for the purpose of working veins, like the owners of the Cold Spring and the Slide; and when most strangers do come among us, they come in tow of some middle-man who is seeking to swindle them in a trade by outrageous brokerage. If capitalists desire to invest in good mines, common discretion ought to teach them to employ a mining expert in these ores as well as in general mining; and, after making careful examination and assays, buy from first hands—the original owners. There is hardly one of these but will extend all due courtesies, and either bond, lease, sell, or give an interest in his property for a specified amount of work in development; but he is afraid of stock operations, and does not wish to stock mines unless the amount is limited, and it is made unassessable. More than one million of dollars could be judiciously invested in this belt of mines, chiefly by running tunnels on some vein that would cut many others, and at the same time drain the lodes, and allow the stoped ores to be brought out where they could be worked or carried away easily and cheaply.

Few persons outside of this immediate section have any idea of the richness of these tellurides. They go by various names, each of which to the expert suggests its commercial value, from telluride of lead (altaite), worth $100 a ton, to common tellurium, valued at from $8000 to $6000 a ton, and so on up to sylvanite, petzite, and calavarite, containing, according to Dana's *Mineralogy*, from forty to eighty per cent of gold by weight. As gold is usually held by miners at $20 an ounce, or $240 a pound, it will be readily seen that sylvanite (a common ore here) is really worth (60 per cent of gold) $140 a pound, when free of rock. I saw a sack of such ore from the Ingraham mine at Salina, last summer, which was taken to the Exhibition at Denver, that was four inches thick of solid sylvanite—worth not less than 50 per cent of gold, and yet could not be sold for over $18.60 a pound. Why? Because the assayers in Colorado do not use more than twenty grams of flux to one of mineral in assays. While it is true that twenty to one would be sufficient to flux all the gold in $100-ton ores, it is also true that the quantity of flux should be doubled for every two hundred more of value shown by the first test, in order to approximate the true value. For instance, if tellurium or sylvanite shows $1000 a ton with twenty grams of flux, the check-assay should be with five times the flux, or one hundred to one, and the result, instead of $1000, would probably be $10,000. The Cold Spring owner sold to Professor Hill, some few years since, about 600 pounds of petzite for $10,400 per ton on a thirty to one flux; according to Dana, that ore was 60 per cent gold, or $140 a pound, or $84,000 for 600 pounds. It was carefully hand-dressed, and if half its weight was stone, still there was a great loss in assay. A professor of the Smithsonian Institution, experimenting on "American" ores at Sunshine, a few years since, demonstrated these facts to the manager, Prof. J. Alden Smith, so satisfactorily, that Smith would not afterward sell any first-class ores to smelters in Colorado, but shipped them East or to Europe.

The Colorado smelters have made fortunes out of Boulder County tellurides in this manner, and the only possible remedy I can see would be a combination of the mine-owners to get up a smelter to treat their own ores; but the miners are so poor that few of them have any surplus from their more expensive mining, as greater depth is attained, to invest in smelters, however profitable it might be afterward. I might add here, that Professor Sewall, of Boulder University, told my informant that "the telluride miners got but 12½ per cent of what was in their ores when sold."

There ought to be a smelter located at or near Boulder City, built expressly to treat this class of ores, and it ought to be run by or in the interest of the mine-owners—not one mine, or half a dozen, but a custom-mill or works for this section exclusively. In a few years, it would save millions that are now coveted by a few, or sent to the winds in vapors. Tellurium will evaporate almost as easily as quicksilver, and the gold therein goes along. I have seen a muffle that had been used but three times in assaying about one dozen samples of ore in scorifying-cups, whose inside was liberally sprinkled with condensed gold sent off by evaporation, and this while both ends of the muffle were open part of the time, from the open air into the furnace-flue. Custom assayers keep their furnaces too hot. Gold melts at about 2000 degrees Fahr., and the litharge flux at 700 degrees or less; combined, 1500 should suffice for fluxing; but a rod of iron will melt readily in any assay-furnace in constant use, and it takes 4000 degrees to melt wrought-iron: no wonder there is such waste of gold. The smelters, however, lose nothing; for in treating rich ores, they melt them under a bath of cheaper metals, such as galena, and so save wastage.

One great advantage in mining in this section is owing to the mildness of the climate. Snow rarely falls as deep as three feet, and then soon goes off before warm west winds or a warmer sun. About half the winter, the ground is bare most of the time, and seldom does the thermometer run down to 20 degrees below zero; much of the time it is between 30 and 50 degrees above. The past January has been one of the coldest known here—several days from zero to 36 degrees below; and a snow-fall of three feet, the greatest ever known here in January. There is about one foot at present—February 16th—with the air at 50 degrees above. Such a thing as a snow-slide was never known in the mines of this county, not even at Caribou, at the timber-line, five miles from the range summit.

Transportation facilities may be called good for a mountain country, there being two water-grade wagon-roads, one down Left-Hand Creek, and the other, mentioned before, down Gold Run, Four-Mile, and Boulder creeks, besides a third along the dividing ridge between the two. The Union Pacific Company last season graded a narrow-gauge road up Four-Mile, and so on toward Caribou, and is now laying rails and building bridges. This road will be opened in the spring, and will come within three miles by the present road, near Salina on

Digitized by Google

Gold Run. Another narrow-gauge road is completed in grade from Longmont into the opening of Left-Hand Creek at the plain's edge, and is designed to be built up that creek to Ward District, passing Gold Hill within one mile. The grade is easy, and it cuts clear across the telluride belt, as does the other road, near its geographical center. They are coming none too soon for the fuel question, as wood is scarce at $5 a cord, while coal at Boulder is but $3.50 a ton.

CLEAR CREEK COUNTY.

DIAMOND TUNNEL.—This company is putting up a plant of machinery to furnish ventilation in the Corry City lode, which has been lately intersected in the tunnel, a distance of 2100 feet, and at a depth of 1500 feet.

WOLVERINE LODE.—This mine, situated at the junction of Democrat and Republican mountains, is worked at present by two men. They are working a rise from the adit-level, which is now in 430 feet and is 150 feet in depth from the surface. The ore shows some fine specimens of native and wire silver.

DOLORES COUNTY.

With the opening of spring, extensive preparations are making by many companies at Rico to work their properties the coming season.

GRAND VIEW MINING AND SMELTING COMPANY.—The furnaces at the smelter have been steadily running all winter, supplied largely by ore from the company's mines, the Grand View, Yellow Jacket, Phœnix, etc.

UNCLE NED.—Steady shipments are made to the Grand View smelter. The mine is under lease until May 1st, when the owners will make extensive developments.

ZULU CHIEF.—Work for the season has been begun with a fine outlook.

NEWMAN GROUP.—This group, including the Newman, Chestnut, and Swansea, has been leased for four months, and work already commenced.

BOWEN.—A suburb of Rico, first opened up last year, has lately developed most favorably. A large quantity of high-grade ore has accumulated on the dump of the Little Susie, which will be shipped to Rico for treatment as soon as the trail now building is completed. LINWOOD O. TOWNE.

GILPIN COUNTY.

FOOTE & SIMMONS.—The main shaft is 515 feet in depth. Work is prosecuted in the lower east and west levels. In the east level, a good ore-body is being passed through. But little ore has been removed below the 300-foot level. This will afford a good ore-reserve for stoping as soon as the present lower levels are driven to a greater distance. The mill-dirt is crushed at the Empire Mill in Black Hawk, but no clean-up has been made since the present manager took possession of the mine.

UNITED GREGORY.—The company is raising 9-ounce ore through No. 2 shaft, taken out at a point as far west as No. 11.

HINSDALE COUNTY.

CROOKE SMELTING-WORKS.—The works are running to their full capacity.

LAKE COUNTY.

BIG CHIEF.—Work will be resumed at this mine.

BROOKLAND.—The company is overhauling the pumping machinery preparatory to beginning active operations, strengthening the foundations of the plant, putting in a new driving-wheel, and making excavations for a new balance-bob half-way down the shaft, to lighten the weight of the rods. This is a ten-inch pump, and as soon as the improvements noted are completed, which is expected by the 20th instant, the water, which stopped all further progress last fall, will be placed under control. At the time work was shut down, there were thirteen feet of ore in the bottom of the shaft, running from fifteen to forty ounces in silver, and sixty per cent in lead. The extent of the ore-body had not been demonstrated.

CLONTARF.—The mine has spent $30,000 in vain endeavors to control the water, will commence work early in the summer.

IRON SILVER.—A strike is reported to have been made in the Lime claim of this group, which is worked under a lease by Fred Beaudry and others.

OURAY COUNTY.

Six stamp-mills with a total of seventy-five stamps will be on operation on the San Miguel the coming season, namely, the Pandora & Oriental, 20 stamps; Andrus's stamp-mill and concentrator, 10 stamps; Golden Group, 10 stamps; Strout's sampling-works and concentrator, five stamps; Gold King, 20 stamps; Church's mill, 10 stamps; the last two named are on Turkey Creek. The Upper San Miguel Company, whose machinery is all on the ground, will in all probability have its mill in operation before fall.

PARK COUNTY.

NESTOR.—The company is pushing development-work on all its property with a large force of men. It has a large amount of ore now mined ready for shipment. The properties consist of the Robert Keeley, Montgomery, Silver Leaf, Gold Leaf, Winchester, Illinois, and Ensign. The development is doing principally through the Keeley shaft No. 2, which is about 120 feet deep. At a depth of twenty-five feet, a cross-cut was run in to cut the vein, which was found to be about nine feet wide. At a depth of sixty-five feet, another cross-cut was driven, and the vein was found to be about five feet wide. The shaft will be sunk to a depth of 180 feet, and a third cross-cut will be run in.

WYANDOTTE.—At present only one shaft is at work. As soon as the president of the company arrives at the mine, extensive operations will be commenced.

SAN JUAN COUNTY.

ROGER LODE.—A rich copper strike was made in this lode recently. This mine already shows a big body of galena. The mineral runs 30 per cent copper.

SUMMIT COUNTY.

ROBINSON CONSOLIDATED.—The financial statement for the year ended March 1st, 1883, just received, shows that 5983 tons of ore were shipped during the year, which yielded about $108,000. The royalties from lessees amounted to $16,514.57 and the balance on hand March 4th, 1882, was $29,614.86. Among the disbursements are: Mining expense, as per superintendent's reports, $81,482.10; general expense, as per superintendent's reports, $21,908.82; legal expense, as per superintendent's reports, $12,449.60. The balance on hand at New York office, March 1st, 1883, is reported at $9729.87, and the balance at the mine on February 1st at $4354.36.

DAKOTA.

FATHER DE SMET.—The superintendent's report for the week ended March 18th shows: Ore extracted from first level, 800 tons; second level, 700 tons; third level, 375 tons. Ore milled, 1925 tons. North end tunnel in 839 feet; third level header in 153½ feet; tramway level rise up 24 feet. Golden Gate header running north advanced 19 feet.

HOMESTAKE.—This company's property consists of five mines under one local management, each owning its mines and mills. There is nothing new to report other than semi-monthly clean-ups and shipments, which, by careful sampling of ore, maintain an almost unvarying average. Superintendent McMaster has so thoroughly systematized all work pertaining to the mines that although over 700 names are on the monthly pay-roll, miles of water-ways to be kept in repair, twenty miles of railroad to be protected from obstruction, a vast wood and timber supply secured daily, and over 2000 tons of ore delivered at the mills every twenty-four hours, there is never a hitch and very seldom an accident. Every thing moves as if by clock-work, and not an employé holds a sinecure or is superfluous.

ORO FINO.—It is stated that this mine never looked better than at present. The ledge is vertical, and has a known width of 80 feet, every portion of which will pay handsomely. There is no waste-dump, every thing passing through the mill.

GEORGIA.

The Dahlonega *Signal* says that considerable prospecting is going on in different parts of the mining districts and many discoveries made. The prospects at the various mines continue to be favorable.

IDAHO.

QUIMBY HILL.—These mines were sold to a New York syndicate recently. The mines are forty miles north from Hailey, on the mountain summit two and a half miles northeast of Galena, and are above the timber-line. Considerable very rich ore has been extracted, and some shipments made last year to the Hailey sampling-works prove it high grade.

SENATE MINING AND SMELTING COMPANY.—The mine is opened by a tunnel to the vein, and a shaft to a depth of 250 feet below the croppings. One hundred tons of ore were packed down last fall to the company's smelter, near Galena. The smelter made a short run before being closed by severe weather, which prevented the hauling of flux to complete the run. The ore averages over 100 ounces silver, with a five-foot vein, which looks better as depth is attained. A large force of men will be employed in the spring in active development of the property.

MEXICO.

Dr. Allen, with a party of Indianapolis capitalists, has gone to Mexico for the purpose of examining mineral property.

CABORCA.—The superintendent reports that he believes there is sufficient water on hand in the wells to enable the mill, which is now running, to turn out from $15,000 to $20,000; and that the pulp-assays of the ore now worked average over $40 per ton.

EULALIA SILVER MINING COMPANY.—The work done in the mine shows a tunnel 760 feet long, eight feet high by seven wide, which is intended to tap several mines; and on the opposite side of the ravine from this tunnel, is another called the Adventure, 275 feet long, which opens out some exceedingly rich ore. Both of these tunnels are rapidly pushed forward while a large force of men is busily engaged in taking out ore from the different mines. The company has planned the construction of a narrow-gauge railroad from the mines to the mill, which is to be built on the Chihuahua River, close to Chihuahua, by Messrs. Fraser & Chalmers. It is stated that the cost of the erection of the mill will be about $80,000. It will be able to treat from seventy-five to one hundred tons per day, and is expected to be in full operation by May next.

PACHUCA DISTRICT.

A correspondent of the Mexican *Financier* writes as follows:

A general meeting of the shareholders of the Estrella and Alta Gracia mines was recently held in Pachuca. A vote of thanks was given to the retiring board, and the following were elected a Board of directors for the present year: Messrs. Horncastle, Foote, Jackson, Petheric, and Gorgollo.

A special meeting of the stockholders of the Santa Gertrudis mine was held in Pachuca during the week, having been called by a majority of the stockholders who had lost faith in the capabilities of their board of directors. The meeting, which was rather stormy, appointed a supervisory committee, consisting of Messrs. Rule, Brockman, and Thomas, passed a vote of censure on the directors, and determined to hold a meeting every Friday, to receive the reports of the committee appointed to supervise the working of the mine. A correspondent writes that the board of directors says that there is no Englishman in Pachuca capable of working the mine, and the English shareholders say that none of the Mexican miners can work the ores. So they seem to have compromised the affair by appointing a Mr. Bolland, about whom both Mexican and English shareholders agree that he is the best person to manage nothing. There is much dissatisfaction at the management of the mine, which is admitted by all to be rich and capable of yielding good dividends.

The Real del Monte Mining Company, probably in deference to public opinion, so forcibly expressed of late, announces that it will resume work in the mines named Ompaques, Santa Clara, San Juan el Alto, Tejocote, Registro de San Rafael, Rincon Grande, and San Luis, of Real del Monte District; and in the Balcon, Xomulco, La Llave, Santa Gertrudis, Milanesa, San Nicanor, and Fortuna, of the Pachuca District. The company has long held these mines under bond, and recently offered to return them to the owners. These, however, refused to accept them without indemnity, alleging that the company had held them idle for many years, for the purpose of monopolizing control of the mining industry. The public is anxious to see whether the activity now promised will be for the purpose of really opening these mines, or of merely complying with the necessary terms of the bond.

MICHIGAN.

The following are the products of the reporting mines for the month of February:

	Tons.	Lbs.
Calumet & Hecla	1453	1720
Quincy	175	350
Atlantic	153	530
Franklin	151	120
Allouez	80	35
Pewabic	69	100
Grand Portage	41	447

HURON.—The bottom of No. 8 shaft is exposing an exceedingly rich run of copper ground in the shape of barrel and stamp work.

OSCEOLA.—At the annual meeting held in Boston recently, the old board of directors, consisting of Joseph W. Clark, Horatio Bigelow, Thomas H. Perkins, George F. Bemis, Charles Van Brunt, John N. Dennison, of Boston, and John Daniell, of Michigan, was re-elected, and at a subsequent meeting of the board Mr. J. W. Clark was elected president and A. S. Bigelow secretary and treasurer.

VALLEY CITY.—According to the Iron *Agitator*, this company has been experiencing trouble with quicksand in sinking its shaft. It has sunk through 40 feet of this troublesome ground, by resorting to iron caissons driven as fast as sinking progressed, and had but a foot farther to drive to reach the ledge, when a vein of water was struck which prevented further progress of sinking for the time being. Added pumps were set at work, and the ledge has probably been reached ere this.

MISSOURI.

The Harris Copper-Works have stacked up at their warehouse in St. Genevieve, 10,420 ingots of refined copper, weighing 135,000 pounds. This is Arizona copper, which they have refined for the Long Island Company, of Globe, Arizona.

MONTANA.

BELL.—Work on the new three-compartment shaft is progressing very rapidly, three frames, or fifteen feet per day, being the average advance. The contractor is under agreement to reach the 400-foot station in one hundred days, when connections will be run with the old workings and the mine explored and developed below.

MOULTON.—After a thorough overhauling, the mill started up for another lon

Digitized by Google

run. The mine is looking well, particularly in the west drift from the 300 north cross-cut, where some very fine ore is extracted.

SHONBAR.—The shaft has reached a point fifty feet below the 185-foot level. The stopes of the east 185-foot drift are showing up better than ever, and the mill returns last week were forty per cent better than in any previous week since the mine became a producer. The first work in the Shonbar was commenced a year ago. During the year, $30,000 have been expended in improvements and machinery. The mine is now running at a profit.

NEVADA.

GEDDES & BERTRAND.—This company's mines, situated near Eureka, continue their output of about $30,000 per month. The leaching process obtains as high a percentage of the gold and silver in the ores as is usual in chloridizing and amalgamating. There is a loss in chloridizing, whether the pulp is thereafter leached or amalgamated. Aside from this loss, which is never taken account of, the leaching treatment of the Geddes & Bertrand mill saves about 85 per cent.

HALE & NORCROSS.—At the annual meeting, held in San Francisco recently, the following directors were elected: H. M. Levy (President), Gustav Reis (Vice-President), George Congdon, S. Heydenfelt, W. S. Hobart, M. Hoeflich, J. B. Russell; Secretary, Martin H. Levy; Superintendent, R. P. Keating; Treasurer, Bank of California; Attorney, S. Heydenfelt.

NEW MEXICO.

MASSACHUSETTS & NEW MEXICO.—Pending the collection of an assessment of 5 cents a share on the stock, this company discharged and paid nearly all its men, retaining only four or five who are now setting boiler and steam-pump, and putting up hoisting-works at the King mine, preparatory to the resumption of active operations at the mines in April. It is not true that the miners have seized the property for wages.

SILVER HILL DISTRICT.—A correspondent of the New York *World* says: This district is situated in the county of Dona Ana. The lodes generally extend north and south, with only slight variations. The capping of the peaks is mostly iron, running from $5 to $8 in silver. In most of the gulches on the eastern slope, placer gold is found in small quantities. In the Rincon, on the eastern slope, copper ore running from 15 to 20 per cent is found as croppings, and the indications are, that the whole place is underlain by an immense copper deposit. In this Rincon is situated the James Fisk group, consisting of the James Fisk, Golden Rule, Providence, and Passaic mines, all showing well for the small development. None of the mines in the southern belt has been developed, 8 to 10 feet being the greatest depth obtained. Select specimens from the Fisk will run 55 per cent copper, and an average assay of ore from all portions of the 10-foot shaft gave a return of 18½ per cent and 6·1 ounces silver; the vein is over seven feet wide, and the shaft all in ore in a lime and porphyry contact. The Passaic assays 20·4 per cent copper, 4·8 silver. South of the Fisk group are the Diantona and Guadalupe mines. They are on the same belt of mineral, and, being the only mines with any work at all done on them for years, have attracted the most attention, and have been considered the representative mines of the district. Experts report them as fine prospects as any ever seen, and probable rivals of the Lake Superior mines. Surface copper is found all over both claims, running from 15 to 33 per cent. Fifteen feet is the greatest depth obtained on either, and Guadalupe has had silver assays as high as 242 ounces silver. West of the Guadalupe is the Paul Jones group; deepest work, 8 feet; assays, 30 per cent copper, 38 per cent silver. South of the Guadalupe is the Refugio, a Mexican claim, the lode running across the main formation from the northeast to the southwest. The ore is lead carbonate, running as high as 200 ounces in silver.

On the high peaks west of the Rincon are situated the Orphan Boy group, Hobart, Iron Duke, Rattler, and Jarrilla King.

Assessment-work is now progressing on the Hobart and Iron Duke. Throughout this belt are found old workings and numerous dumps of rejected ore that could not be packed the long distance necessary in the days the mines were then worked. There is no authentic history of the working of these mines; but the evidence is, that the work was carried on extensively, one dump alone proving that the shaft must have been down hundreds of feet. The shafts are filled with *débris*, and the dumps partially covered with the wash from the mountains. Most of these shafts are in the Rincon, before mentioned. In the northern end of the mountains are the properties of Knowlton & Co. and Noble & Dougher, consisting of the Jarrilla Queen, owned by Noble & Dougher, down twenty-six feet and showing well in copper—37 per cent copper and nine to eleven ounces silver. It is a very flattering prospect. About 1500 feet west is the Isabella, down fifty feet, showing well in copper, but still badly broken up. Depth is necessary to prove this mine. About four miles southeast is the Egyptian group and the Savage and Lone Star mines. The Savage has the assessment-work done, and telluride ore running 82 per cent has been found. The lode runs nearly north and south through the two locations. The work now progressing on the Lone Star is about fifty feet from the shaft of the Savage. The lead has every indication of a true fissure. There are no blow-outs, but it is a lime contact.

There are many other good prospects—the Three Bear mines, the Juliett, Homestake, Vulcan, Eureka, Little Page, Hope, Lincoln, Honest Indian, Constitution, etc.—in the southern end. The Constitution is a lime and granite contact, the only one thus far discovered in the mountains. Native copper is found in the lead, and the owners are now at work, expecting to sink forty or fifty feet.

SOLID SILVER.—The discovery-shaft on the Black Hawk, the property of this company, is down 60 feet, with levels running east and west at 52 feet. On the east level, there is a winze sunk to a depth of 70 feet, with a level running to the east a short distance. The second shaft is known as the Huneke shaft, and has been sunk to a depth of 115 feet, with a level at 50 feet extending but a short distance to the east. Large bodies of ore have been unearthed in this shaft. Another shaft, called the Josephine, has been sunk on this, the southern vein, to a depth of 42 feet, making three shafts on the vein. The northern or Gopher vein has two shafts upon it, besides levels running to connect them. The shafts are down 42 and 43 feet, respectively. There are two parallel veins upon the Black Hawk claim, on which the work has been done, and both are true fissures. The mines are in excellent shape to begin extensive work upon them, and better mineral than that taken out can not be found—native, horn, and argentite silver. The present development-work justifies the erection of reduction-works.

TORRENCE.—This mine, situated at Socorro, is to be worked to a depth of 500 feet under new auspices.

NEW YORK.

Messrs. Cooper, Hewitt & Co., owners of the iron mines at Toadt Hill, Staten Island, have purchased the Townsend property at Clifton for $21,500.

NORTH CAROLINA.

A large bed of phosphates has been discovered in Brunswick County, on the line of the Carolina Central Railroad, and about eleven miles from Wilmington.

UTAH.

EMPIRE.—The Salt Lake *Tribune* says that it appears McCormick & Co. had the first claim against this company, and some weeks ago secured their claim by attachment on the machinery for a stamp-mill. At the sale of this mill recently, Mr. McCormick bid the property in for the amount of his claim, which aggregates about $10,000. As we understand it, the sale is positive and beyond redemption on the part of the company. This machinery cost at the factory in the East $49,000, and there was paid for freight on it to Park City $17,500 more, making a total of $66,500. The engine has a capacity of 500 horse-power and the machinery is complete for a 30-stamp silver mill, while the power is ample to double that number of stamps and pans.

HORN-SILVER.—A dispatch to the New York *Tribune* states that a part of this mine has caved in. A settling down on the slope of the foot-wall of the old cave of two years ago has occurred. No one was hurt. It has not yet interfered with the working of the shaft.

NEW YORK & UTAH.—This company is about to resume operations. Mason M. Hill, manager of the affairs of the company in Utah, lately arrived from the East, and is perfectiug plans to start the smelter belonging to the company. This smelter is located in the valley at the foot of Bingham Cañon.

OLD TELEGRAPH.—It is stated that the works of this company are about to start up, at least in part and experimentally, to see if something can not yet be made out of the Old Telegraph ores, particularly those which are found in a chloridized condition, and therefore adapted to treatment by leaching.

ONTARIO.—At shaft No. 3, drifting both ways is done on the ledge, and good ore is taken out. The shaft is sinking to the seventh level. After reaching a depth of 700 feet, the huge pump will be put to work, which will greatly reduce the cost of freeing the mine of water. Work is also going forward rapidly on the tunnel. At the intermediate shaft, the tunnel is extending both ways, while from the lower end, now in nearly half a mile, good progress is made.

STORMONT.—Mr. Schuyler Van Rensselaer, the secretary, has sent us the following: Our ore, which ran low grade during the past four months, has lately greatly improved, and now averages about $23 per ton. We have been working the Buckeye and Last Chance claims only. Lately very good ore has been struck just north of the Stormont claim, which has not been worked for years. There is every reason to believe that the vein runs into the northern and undeveloped part of the Stormont claim. This will give us a new ore-supply. The Thompson & McNally claims are yet undeveloped.

MINERAL PATENTS GRANTED BY THE UNITED STATES LAND-OFFICE.

CALIFORNIA.

SACRAMENTO CITY DISTRICT.

William F. Hanley, Hanley quartz mine. Nevada City, Gold Quartz Mining Company, Nevada City Extension gold quartz mine.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, March 23.

There is very little to say in relation to the mining market this week. Business has been very flat, and has been confined almost entirely to the low-priced fancies. In fact, the whole market has been between the brokers themselves, and has been manipulated to suit their requirements. Below will be found a complete summary. The total sales of mining shares at all the Exchanges aggregate 323,960, as against 456,790 last week.

The Comstock shares have been very quiet and about steady. California, with a small business, was weak, selling, assessment unpaid, from 6@4c. Consolidated Virginia has been quiet and irregular, selling from 50@45@48c., with a business of 3775 shares. Sierra Nevada sold at $3 under one transaction. Union Consolidated has been quiet and irregular, and sold from $5.50@$4.70. Mexican was a little weak, but was fairly dealt in; it sold from $4.13@$3.60. Consolidated Imperial sold at 8c.; it was quiet. Yellow Jacket was quoted at $2.25. Best & Belcher was very quiet, and sold at $4.13. Sutro Tunnel has been almost forgotten; it was very quiet at steady prices, selling from 21@20c., with a business of only 1500 shares.

The Leadville stocks record a small business and have been steady. Amie was active and irregular, selling from 23@26@25c., the sales aggregating 14,400 shares. Chrysolite had a small business at steady prices; it sold from $1.30@$1.35. Dunkin sold yesterday at 28@30c. Hibernia records one small transaction at 3c. Iron Silver had a small business and was very irregular; it sold from $3@$2.75@$2.80. Leadville was quiet and steady, selling from 73@70@72c. Little Chief records a small business and was steady, selling from 39@38c. Little Pittsburg sold at strong prices, under a moderate business, selling from 65@71@70c. Big Pittsburg declined from 17@11c., closing at 14c., with a business of 1000 shares. Climax records a small transaction at 9c.

The Bodie stocks were quiet, and prices were on the decline. Bodie Consolidated, with a business of 1260 shares, was irregular, selling from 90@80@85c. Standard was quiet and a little weak; it sold from $6.88@$6.50. Bulwer records a small business at declining prices, selling from 95@85c. Goodshaw was quiet and steady at 4@5c.

The Tuscarora stocks were very quiet, and record no material change in price. Grand Prize sold at 45c. Belle Isle was quiet and steady, selling from 52@55c. Navajo was also steady, selling from $3.40@$3.50, with a business of 625 shares. Independence was quiet and steady, selling at 40@43c. Elko Consolidated has been very quiet and very irregular; it sold from 16@10@13c.

In the miscellaneous list, Alice has been very irregular under a small business, selling from $3@$2.70@$2.95. Bassick has suffered a decline, and has sold from $11⅛@$10⅝ under a small business. Eureka Consolidated has been quite weak, declining from $7.25@$5.50; the sales amounted to 1040 shares. The Green Mountain stocks have been very quiet, and record no change in price. Gold Stripe sold at 7@8c. Green Mountain sold yesterday at 78@79c. We learn that the taxes on this property have been paid, the mill has resumed work, and that a loan has been effected of $7500, relieving the company from financial embarrassment. In addition to this, all but five of the bonds have been taken. Rising Sun was quoted at 5c., and Cherokee at 3@5@4c. Horn-Silver has been almost neglected, and has been steady; it sold from $7.88@$8 Northern Belle was dealt in mostly on time sales; it was irregular, selling from $9.50@$9.75. Robinson Consolidated records a very active business, but continues to grow weaker; it sold from 78@62c., then up to 75c. yesterday, and closed at 71c. Sierra Grande has also been very active and has been very irregular; it sold from $2.45@$2.75@$3.40, closing at $2.50 yesterday.

Central Arizona has been quiet and steady at 37@35c. Decatur records a very active business at steady prices, selling at 6@8@7c. Durango was quiet and steady at 9@8c. Eastern Oregon, with one transaction, sold at 75c. Harlem M. & M. Co. has been active and strong; it sold from $1.35 $1.40. Lacrosse records a very active business, but has suffered a slight decline, selling from 18@14c Oriental & Miller has been active and strong, selling from 13 17c. Sonora Consolidated has also been very active at very irregular prices; it sold from 45@34@41c. South Hite, new, was active and strong at 9@14c. South Pacific has had an active business at steady prices, selling at 7@8c. The State Line stocks have been quiet and steady; Nos. 1 and 4 sold at 4c., and Nos. 2 and 3 at 7@6c. Taylor-Plumas records an active business at steady prices, selling from 17@18c.

A suit is about to be begun by several prominent members of the American Mining Stock Exchange against the Mutual Trust Company for an accounting of the funds placed in the hands of the Trust Company upon the organization of the Mining Exchange. The Trust Company was organized by Milton S. Latham, ex-Governor Safford, Drake De Kay, and other promiuent Western mining capitalists, three years ago, and under its auspices the Mining Exchange was organized and begun business in June, 1880. Memberships in the Exchange were sold for $1000 each, and it is claimed that this money was to be held in trust for the Exchange by the Trust Company. The Mutual Trust Company (then known as the Mining Trust Company) received $171,000 from this source, as well as other sums from dues, fees for listing mining stocks, and transfer and registry fees, amounting in all to about $200,000. The Exchange members claim that, in a circular issued at the time of the organization of their Board, the Trust Company promised to hold a $1000 government bond against each $1000 Exchange membership. They deny that they were given any notice of the rescinding of this action, as is claimed to have been done by the Trust Company. Vain attempts have been made, it is said, to obtain from the Trust Company an account of the expenditure of this $200,000. The managers of the Trust Company are charged by the mining brokers with having diverted it to their own speculations. About a year ago, the Trust Company increased its capital stock from $50,000 to $2,000,000, and $1000 stock each was issued to the members of the Exchange. Subsequently, this increase was decided in the courts to be illegal. There have been frequent changes in the management of the Mutual Trust Company, the original directors having been ousted from office before a year had elapsed. Since that time, there have been frequent quarrels between the company and the American Mining Exchange over the funds raised for the organization of the latter institution.

The trustees of the Columbia Consolidated Gold and Silver Mining Company recently applied to Judge Truax, of the Superior Court, for the appointment of a receiver and for the dissolution of the company, on the ground that the mines owned by the company could not be profitably worked. The application was granted, and Mr. Franklin H. Smith was appointed receiver. The value of the company's property is said to be not more than $10,000.

MEETINGS.

Colorado Coal and Iron Company, Colorado Springs, Colo. Annual meeting of stockholders and election of trustees, April 2d, at twelve o'clock M.

Legal Tender Gold and Silver Mining Company, No. 7 Nassau street, Room 8, New York City. A special meeting of stockholders, March 29th, at one o'clock P.M.

Lucky Boy Gold and Silver Mining Company, 18 Wall street, New York City. Annual meeting of stockholders and election of trustees, April 10th, at three o'clock P.M.

Peru Steel and Iron Company, 115 Broadway, New York City. Annual meeting of stockholders and election of trustees, April 5th, at three o'clock P.M.

DIVIDENDS.

The Bassick Mining Company, of Colorado, declared a dividend (No. 2) of $100,000, or $1 per share, payable April 2d. Transfer-books close March 28th, and reopen April 3d.

The Contention Consolidated Mining Company, of Arizona, has declared a dividend (No. 14) of twenty-five cents per share, payable March 28th. Transfer-books closed March 17th.

The Sierra Grande Mining Company, of New Mexico, has declared a dividend (No. 6) of twenty-five cents per share, payable April 2d. Transfer-books close March 24th, and reopen April 3d.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, No. 55 Broadway, report as follows for the week ended Thursday, March 22d, one P.M:

The decline in production of the Cooper tract which was mentioned last week continued, and upon the strength of this the market during the past week touched the highest point this year.

Oil opened Saturday at $1.03, declined to $1.00⅞ closing about $1.01½. Monday morning, it opened $1.02⅝, touching $1.06, at which it closed. Tuesday it opened $1.07⅛ and climbed up to $1.10, from which it reacted to $1.05¼ at the close in New York, though $1.06 was at the same time bid in Oil City Wednesday it opened $1.06⅛ bid, sold up to $1.07¾ and down to $1.03.

During the recent sharp advance, the New York market has generally been from ⅛ to ¾ lower than Oil City, as the sentiment here was hardly so bullish as there.

On the 22d, it opened at $1.05, sold down to $1.03, up to $1.05¼ here, though $1.04¾ was the highest in Oil City, at which price it closed for the noon session.

Thus it would seem that brokers here are becoming more bullish. The Cooper tract is falling off in production, which is only about 1200 barrels daily.

It appears that a greater significance is attached to the Cooper tract than facts would seem to warrant; for during the extreme fluctuations of this year, namely, from $1.06 down to .86 and up to $1.10, the fact was always clear that the Cooper tract territory is unreliable, that many wells come in dry, and that those in which oil is found decline rapidly in production after being opened. Thus no reliance could properly be placed upon its continued production, and no reason appeared for any important production in that quarter. The total production of that tract during the last eighty days would not equal 200,000 barrels, yet the surplus stock in the custody of the United Pipe Line Company has increased over 1,400,000 barrels during that time. Deduct the production for this period of the Cooper tract, and the fact remains that the increase has been 1,200,000 barrels from the old districts. This is not a bullish showing; for it means 15,000 barrels daily increase in stock on hand. Oil may advance to higher figures, but there is no scarcity of the commodity, notwithstanding all the "bull" talk, which claims that consumption will soon outrun production. The above figures do not lend much credence to such statements.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
March 17....	$1.02¾	$1.02¾	$1.00⅞	$1.01⅞	534,000
19....	1.02	1.05½	1.02	1.05½	482,000

Total sales.					2,853,000

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, March 22.

The market for copper stocks has lapsed into a chronic state of dullness and inactivity; the sales the past week hardly warranting the name of a market. Prices, however, are firm, and Calumet & Hecla shows an advance of $4 per share over last week, all the sales being at $240. The reported sale of 10,000,000 pounds of ingot copper for export has created a better feeling among dealers, and has no doubt tended to influence the advance in Calumet & Hecla, that mine being the largest producer in the country. Franklin was exceptionally weak in the early dealings, and declined from $12 to $11, but later it recovered and was in good demand to-day at $12@$12⅛. In Pewabic, there was nothing doing; the reports from the mine are not encouraging; the stock is offered at $6 without takers, the best bid being $4⅛. Quincy very dull; sales at $48@$48⅛; a lot of five shares only sold at $49⅛. Osceola declined to $29⅛, ex dividend. National sold at $1. The annual report of the Huron Copper Company, just published, shows an indebtedness of about $21,000, and another assessment is among the probabilities of the near future.

In silver stocks, the market is dull, and prices generally lower. Catalpa, which is the most active stock on the list, declined on the unfavorable report of the mine for February from 60@45c., with later sales

Digitized by Google

at 47⅛c. Crescent also declined from 27½@22½c. Bonanza, steady at $2½. Silver Islet sold at $3. San Pedro declined from 62½@55c. Sullivan sold at $1⅛. Indian Queen, at $1⅝.

There has been but little doing at the Mining Exchange the past week, and the market is without any special feature.

3 P.M.—At the afternoon Board, Calumet & Hecla sold as before, at $240. Osceola, at $29½. A small lot of Pewabic, at $6. Franklin, $12 bid, $12½ asked. Quincy, $48 bid, $49 asked. Atlantic, $10 bid, $13 asked. Catalpa, 45c. bid. Huron, $¾ bid. National, $1 bid.

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has displayed more activity and strength than for the past few weeks. The Comstocks have come in for a good share of the business and have shown some strength. There is no news of importance from the mines. The outside stocks remain quiet and firm.

19	51	110⅞	22	50¾	109¾
20	50¾	110	23	...	...

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended March 23d, as compiled from various sources, amounted to $184,334.47, as against $348,929.75 reported for the previous week. The receipts from January 1st, 1883, to date are $3,435,563.74.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended March 17th	$765,995
Corresponding week last year	262,235
Since January 1st, 1883	3,226,346
Corresponding period last year	12,496,983

Imports.

Week ended March 17th	$204,110
Corresponding week last year	130,056
Since January 1st, 1883	1,581,916
Corresponding period last year	880,068

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the rate for discount, which remains at 3 per cent. The bank lost during the week £67,000 bullion, and the proportion of reserve to liabilities was reduced from 42 3/16 to 40 13/16, against 45 11/16 in the corresponding week last year. The Bank of France gained 2,400,000 francs gold and lost 5,975,000 francs silver during the week.

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.11 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 14⅛ per cent, to arrive at actual value.

MINES.	States.	For the week.	Month of February.	Year from Jan. 1st, 1883.

METALS.

NEW YORK, Thursday Evening, March 22.

Copper.—The principal feature during the week has been the rumor that upward of 7,000,000 pounds of Lake copper have been sold for export at a price reported to be 16 cents. We discuss the situation editorially, and need only add now that, previous to the transactions named, there have been sales of small lots of Lake at 17⅜@17½c., while transactions in other kinds of copper have been made on the basis of 15¼@15½c. How far the export sales will check the demoralization in other brands remains to be seen. It will certainly aid them materially. The latest English cables are £72@£72 5s. for Best Selected, and £65 10s.@£65 15s. for Chili Bars.

Tin.—The market has been more quiet, sales aggregating from 300 to 400 tons, closing at 22½c. spot for large lines of Straits, and 22¼@22⅝c. for jobbing lots. The shipments from the Straits for the first two weeks of the month were only 50 tons. England cables £97 5s. £97 10s.

Lead.—The only wholesale transaction of which we have been able to learn was the sale of 100 tons of Refined lead at 4·70c. Business is extremely dull and lifeless. The Richmond Company is accumulating a stock here that is not, probably, very far short of 2000 tons; but as yet its representatives have shown no disposition to place any of it on the market. In the West, the representative of the Horn-Silver and Omaha works must also be accumulating some lead, so that there seems little prospect for any upward movement in this metal, while some of the heaviest consumers are well supplied by recent purchases. England is unchanged at £18 10@£18 15s. for English Common.

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day:

The market remains about the same, if any thing a shade weaker. Sales during the week were 290 tons of Refined at 4·25c. and 100 tons of Hard at 4·22½c.

Spelter.—There is a decidedly better feeling, and prices have been advanced, chiefly, it would appear, in consequence of a better demand in the West. Much of the business is done directly, and the quantities reaching the open market are therefore not large, since the import movement has entirely ceased. We quote 4·75@4·85c. for ordinary to good domestic brands. England cables £15 10s.@£15 15s.

Antimony.—Business has been quite active, about 150 casks changing hands. We quote 11c. for Cookson's and 10c. for Hallett's, the bulk of the stock being in dealers' hands.

Quicksilver.—The market during the week has been shaky and 36½@37c.—*San Francisco Commercial Herald.*

IRON MARKET REVIEW.

NEW YORK, Thursday Evening, March 22.

The British Board of Trade returns for the two first months of the year show the following movement to this country of iron and steel:

	To U. S. 1883.	To U. S. 1882.	All countries. 1883.	All countries. 1882.
Pig-iron	40,133	58,574	165,078	195,310
Bar, angle, bolt, and rod	2,513	5,900	43,466	52,511
Railroad, of all sorts	11,623	51,032	156,515	151,621
Hoops, sheets, and plates	3,961	5,528	52,895	48,702
Tin plates	31,031	33,273	39,483	49,430
Old	7,535	22,372	11,485	28,639
Steel, unwrought	6,706	33,106	11,874	37,362

American Pig.—The lack of vim which we noted in our last has deepened into apathy, and beyond contracts for a few thousand tons, nothing has been done. Buyers show no desire whatever to take hold, and while the makers of well-known brands appear little affected, and firmly adhere to their figures, there is more irregularity in outside brands, and the market is weaker. We quote $22.50@$25 for ordinary to choice No. 1 Foundry; $21.50@$22.50 for No. 2; and $19.50@$20.50 for Gray Forge, of which sales aggregating about 1000 tons have taken place at low figures. Bessemer pig is quiet and dull, with quotations at $20@$21 for American at furnace, and $21.50@$22 nominally at tide-water for foreign. Spiegel is unchanged.

Scotch Pig.—We have nothing new to report in the way of business in Scotch pig. Arrivals foot up to 2500 tons, mostly sold previous to arrival. Sales have been very small. Freights are unchanged. We quote: Coltness and Langloan, $24.25@$24.50; Summerlee, $23.50@$24; and Eglinton, $21@$21.50. At the Wall Street Exchange, the following cable quotations were received to-day: Carnbroe, 55s. 3d.; Gartsherrie, 62s.; Summerlee, 62s. 3d.; Coltness, 64s. 6d.; Langloan, 64s. 9d.; Glengarnock, 55s.; and Eglinton, 49s. 6d. Warrants were 47s. 6d.

Rails.—Beyond a few sales of small lots, there is nothing to report. For such small quantities, $39 at mill is the ruling price, but it is probable that for large contracts, later delivery, less would be accepted; in fact, it is stated that recent large transactions have been on the basis of $38. Western mills are trying to get $42, but it is believed will take considerably less.

Old Rails.—Business has been quiet, with values unchanged, at $24@$24.50 for Ts.

Scrap.—Small sales have taken place at the range of $24@$24.50 ex ship.

Philadelphia. March 23.

Buyers are still holding off and restricting their purchases to small lots for current requirements. Quotations show no improvement as yet, and manufacturers and makers of pig-iron are generally disposed to accept all offers made, provided they are within safe reach of the selling prices.

Pig-Iron.—Transactions in pig since Monday have been mainly in forge iron and those of standard brands. A few lots of inferior have been sold as low as $18 at furnace and some at $18.50, but $19 is claimed as the average selling price for good brands. Special brands are selling at $19.50@$20, and one or two as high as $20.50; no special brands being offered. Manufacturers are preparing to purchase more freely than they have done heretofore, as their stocks are low, and prices are not likely to decline any

further. Wants will not be anticipated very far ahead, as the volume of demand is doubtful. Foundry is moving in small lots at $24@$25, with one or two special brands about this figure. No. 2 iron is to be had at $22.50@$23. White and mottled lots are heard of occasionally at exceptionally low figures. Buyers are more disposed to come into the market just now than they have been for several weeks, but there is still an element of doubt manifesting itself as to the future course of the market.

Muck Bars.—A few small transactions in Muck Bars were reported at $36@$36.50, though sales have been made below these figures. Charcoal Blooms are moving along in a slow way at $64; Anthracite, $55 Occasional concessions are made from these figures.

Merchant Bar.—Finished iron is in a very unsettled condition. Transactions are restricted to small lots. Buyers look for a further weakness, but manufacturers claim there is nothing in iron at present figures. Western competition has manifested itself more freely within a few days, and lots of refined are offered in this market at 2·10@2·20c. Buyers are disposed to defer large engagements, and take advantage of such offers. Card rates, 2·30c. Nothing outside of small lots from store command this figure. Average prices are 2·20@2·25c. Large lots, 2·15@2·20c. Common iron is selling from 2·15c. down to 2c. Pittsburg iron is offered there at 1·90c. plus freight. This new competition is creating a good deal of unrest among buyers, who are naturally restricting demand until bottom is reached. Skelp iron is fairly active at 2·15@2·30c. A few transactions in wrought pipes and tubes have been closed at 67½@70c. off pipes and 55c. off tubes.

Sheet-Iron is moving in small lots at 4@4½c., with good concessions for large orders, which are now coming along.

Nails are quoted bottom at $3.15 for car-load lots, to $3.20@$3.30 for small lots, though offers at $3.10 would be accepted, and buyers were not willing to take hold even at this figure, in view of the possible excess of supply due to full time in the West. Pittsburg nails have been offered in New York at $3 at mill.

Structural Iron.—A leading firm here has secured a contract for the construction of a two-mile bridge near Harrisburg. The contract is a large one, and was taken at satisfactory figures. Quotations in small lots are given at 2½c. for Angles; 3¼c. for Tees; 3½c. for Beams and Channels. The outlook is favorable for an active demand, but buyers are very slow to place orders unless concessions are extended.

Plate and Tank.—The volume of business since Monday in Plate and Tank has not been large. Common plates are 2½c.; Shell is quoted at 3½c., and Flange at 4¼c., but large orders can be placed at shaded figures.

Steel Rails.—There is much difference of opinion as to inside steel rail quotations. One establishment here quotes $41, but would take very nearly $3 less. Average quotations for small lots are $39@$40. Negotiations are in hand for large lots, and rumor states that probable figures will be near $38.

Old Material.—English Tees are quoted at $24.50. Transactions small. Double-Heads are offered for shipment at $27, tide-water delivered.

Scrap.—A few sales of Scrap have been made at $27.50 for selected No. 1, ex yard. Buyers are purchasing for immediate requirements only. No. 2 is selling all the way from $25@$26.50, according to quality and location.

Cleveland. March 21.

Our pig-iron market has more life than at last report, but values are unchanged beyond the advance of 50c. to $1 made by Southern furnaces. Compared with January 1st, 1883, furnace yards show considerably smaller stocks, especially of good No. 1 Foundry. Consumers are supplied for from three to six weeks, but are inclined to purchase more liberally than of late.

The prices for Lake Superior ores for the coming season are being fixed on the basis of $8.50 on docks here for Republic. In this branch of the trade, there is a marked inquiry, but few sales have thus far been consummated. We quote:

No. 1 Bessemer	$23.50@$24.00
" Foundry, all ore	22.50@ 23.50
" Foundry, cinder mixture	22.00@ 23.00
" Soft Foundry	21.50@ 23.00
" Open silvery	21.50@ 22.00
Mill Irons	19.50@ 22.00
Four months, f. o. b. cars furnaces:	
Nos. 1 and 2 Charcoal	26 50@ 27.50
Nos. 3, 4, 5, and 6 Charcoal	27.00@ 28.00
Hanging Rock Charcoal	23.00@ 26.50
Strictly Cold-Blast Charcoal	28.50@ 31.00
Four months, f. o. b. cars Cleveland:	
Bessemer ores	8.50@ 10.00
Hematite "	6.00@ 8.00

COAL TRADE REVIEW.

NEW YORK, Friday Evening, March 23.

Anthracite.

On Saturday, the Pennsylvania Coal Company issued the following circular for Pittston coal at Newburg:

Lump	$3.95
Steamer	3.95
Grate	3.90
Egg	3.95
Stove	4.05
Chestnut	4 15
Pea	2.85

And this was followed promptly by the other companies, who agreed upon the following opening prices:

Broken, f. o. b	$3.90
Egg, "	4.00
Stove, "	4.20
Chestnut, "	4.30

These figures are a little higher than the opening prices of last year, and are slightly above the equivalent of the Pennsylvania Coal Company's list, taking into account, on the one hand, 20 cents off to contractors, and on the other hand, a difference in price of 15 cents here and in Newburg.

It can not be said that the announcement of these figures has as yet produced any effect; in fact, we hear that there have been sales during the week at low figures. Buyers have not shown any particular eagerness to take hold at the new prices. How long they will be able to hold off remains to be seen, but their position will be strengthened unless the policy of restricting is continued for some time to come. It has not yet been definitely settled whether there will be full or half-time next week or the week following.

Mr. John H. Jones, accountant, has published the following statement of the anthracite coal tonnage for the month of February, compared with the same period last year:

	February 1883.	For year 1883.	For year 1882.	Differ'ce.
Phila. & Reading RR.	475,143	940,653	772,654	I. 167,999
Lehigh Valley RR.	*401,388	832,965	696,968	I. 135,996
Central RR. of N. J.	280,329	584,812	493,517	I. 91,295
Del., Lack. & W. RR.	308,626	646,887	552,456	I. 94,431
Del. & Hud. Canal Co.	†194,861	442,586	409,740	I. 32,846
Pennsylvania RR.	165,160	327,318	302,023	I. 25,295
Penna. Coal Co.	90,551	193,304	163,025	I. 30,279
N. Y., L. E. & W. RR	21,636	45,209	48,769	D. 3,559
Total.	1,937,996	4,013,738	3,439,154	I. 574,584

* This amount includes the production of the mines of the State Line & Sullivan Railroad Company, amounting to 5402 tons.

† In addition there were 39,279 tons transported from mines by Delaware & Hudson Canal Company during February, which are included in tonnage of other interests.

The stock of coal on hand at tide-water shipping points, February 28th, 1883, was 575,695 tons; on January 31st, 1883, 616,759 tons; decrease, 41,064 tons.

Bituminous.

The trade is exceedingly dull, more lifeless, in fact, than it has been for many years at this season. Though prices are low, consumers insist upon concessions even for the small quantities they buy under pressure of actual needs. Freights have declined sharply during the past ten days, and have reached a figure that must leave but little for the boatmen.

The only transaction of any importance that we hear of in the way of contracts is the closing of a 10,000 ton contract with the Fitchburg Railroad, secured by a company mining George's Creek Cumberland, at a low figure. We quote nominally for Cumberland $4.45@$4.70, according to quality, and Clearfield $4.40@$4.65.

SUPPLIES.

Phosphor-Bronze Wire.

Stubs gauge.	Diameter, in.	Weight per mile, lbs.	Breaking strain, lbs.	Price per pound, cents.

Increase		423,196		
Decrease				

The above table does not include the amount of coal consumed and sold at the mines, which is about six per cent of the whole production.

Horsford's Acid Phosphate

In Sick Headache.

DR. N. S. READ, Chicago, says: "I think it is a remedy of the highest value in many forms of mental and nervous exhaustion, attended by sick headache, dyspepsia, and diminished vitality."

ASSESSMENTS.

SAN FRANCISCO, March 5, 1883.

THE BODIE CONSOLIDATED MINING COMPANY has levied assessment No. 2 of FIFTY CENTS PER SHARE, delinquent April 16th. Sale day, May 16th. GEORGE W. SESSIONS, Secretary *pro tem.*

TIP TOP SILVER MINING COMPANY.

Location of principal place of business, San Francisco, California.

Location of works, Yavapai County, Arizona Territory.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 8th day of March, 1883, an assessment (No. 5) of TWENTY-FIVE (25) CENTS per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, Room 44, Nevada Block, No. 309 Montgomery street, San Francisco, California, on all certificates of stock issued at San Francisco, and at the Farmers' Loan and Trust Company, No. 20 Exchange Place, New York City, on all certificates issued at New York.

Any stock upon which this assessment shall remain unpaid on MONDAY, the SIXTEENTH (16th) day of APRIL, 1883, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the FOURTEENTH (14th) day of MAY, 1883, to pay the delinquent assessment, together with cost of advertising and expenses of sale.

By order of the Board of Directors.

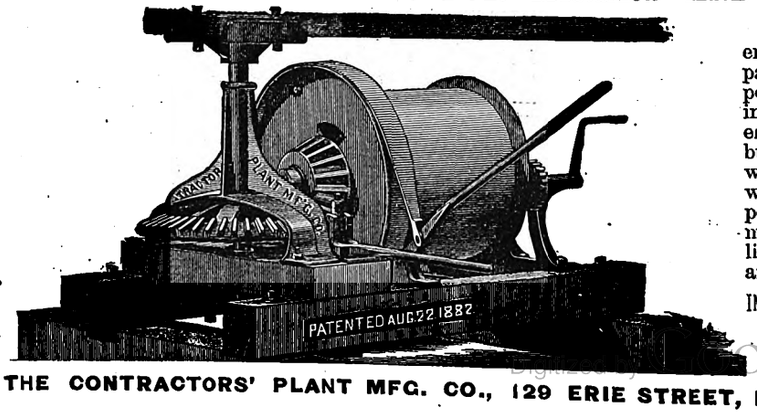
HENRY DEAS, Secretary.

Office, Room 44, Nevada Block, No. 309 Montgomery street, San Francisco, California.

ASSAYERS' SUPPLIES.

(Established 1848.

Balances and Weights, Furnaces, Scorifiers, Cupels, Crucibles, Tongs, etc.



A LARGE STOCK. Also

CHEMICAL APPARATUS OF ALL KINDS.

Trial orders solicited. E. B. BENJAMIN,

6 Barclay and 12 Vesey Sts., New York.

DERRICK HORSE-POWER FOR MINERS AND BUILDERS.

This is a horse-power designed principally for mining purposes or raising building material in the erection of high buildings. A horse will raise a bucket weighing 600 to 700 pounds 75 feet per minute. Is small, light, easily handled and durable.

WE understand that there is a movement on foot to bring into the markets of the world brimstone from the west coast of South America.

THE Indians are again making their spring raids, and are seriously threatening the famous Clifton copper district. A series of outrages has already been committed. In spite of the warnings that annually cost so dearly to private interests, the government persists in maintaining only a small force for their protection.

THE details of the plan which we announced in our last issue as completed last Friday, for the consolidation of the Iron and Metal Exchange and the New York Iron and Metal Exchange, have been made public. The members of both Exchanges are given the option of joining the new organization, to be called the New York Metal Exchange, within thirty days after notice has been given of the new organization, upon payment of an initiation fee of one hundred dollars, the membership to be limited to four hundred.

THE Commissioners of the Chicago Exposition of Railroad Appliances have had the good idea of appointing a committee, of which Mr. WILLIAM SOOY SMITH is chairman, to make tests of the strength and quality of substances used in general construction. A circular giving details has been issued by Mr. E. H. TALBOTT, the Secretary of the Exposition, and we trust that the request for specimens will be widely complied with by manufacturers of structural iron, steel, and metals.

THE Compendium of the Tenth Census, recently issued, contains some figures which will serve to give an idea of the magnitude of the quarrying interests of the country, which in 1880 gave employment to 39,723 men, 8059 horses, and 851 mules; had 339 machines for quarrying, 2290 machines for hoisting, 1308 machines for dressing, and used $192,175 worth of explosives. The capital invested is given at $25,414,497, and the value of the product in the census year at $18,356,055, there being 1525 quarries in all. Marble and limestone lead the list with 65,523,965 cubic feet, followed by the sandstone quarries with 24,776,930 cubic feet, crystalline siliceous rocks with 5,188,998 cubic feet, and slate with 457,267 squares, or 4,572,670 cubic feet.

CLOSELY following upon the statistics for 1880, which we printed in a recent issue, comes the official statement of the production of Spain in 1881. The make of lead was 90,672 tons, of which 7690 tons are reported as "argentiferous lead," whatever that may mean. It is well known that desilverizing is done much more extensively in Spain than formerly, and yet the export statistics show that as yet the Spanish works have not so entirely crowded out the English works as these figures would seem to indicate. The copper production seems to have remained stationary, being reported at 23,478 tons, the amount of pyrites raised being 1,455,892 tons. The manufacture of spelter has increased from 4221 tons in 1880 to 7032 tons in 1881, while the yield of quicksilver was 1812 tons, against 1387 tons.

ALABAMA COAL AND IRON LANDS.

During the last days of the session of Congress, a bill passed the Senate, after receiving the sanction of the House of Representatives, which to say the very least makes extensive frauds possible. Notwithstanding the fact that the time of the Senate was restricted and important measures were pending before it, the bill in question did not escape without searching scrutiny. The points brought up against it were sufficiently specific to demand more mature consideration and more hesitation on the part of those who voted for it.

Previous to 1873, public land was sold in Alabama to small settlers. In that year, a law was passed providing that "coal lands" of the United States should not be sold at less than $20 an acre if within 15 miles of any completed railroad, and for not less than $15 an acre if outside of the 15-mile limit. By later laws, coal lands in the States of Kansas, Missouri, Nebraska, and Michigan were made available for sale as agricultural lands, and the Hon. JOHN T. MORGAN, of Alabama, claimed for Alabama a similar right. In the House of Representatives, the bill was quietly passed. As framed originally by the friends of the measure, it read, like the similar ones relating to Kansas and Missouri, that "coal lands of the United States in Alabama shall hereafter be subject to disposal as agricultural lands, any law to the contrary notwithstanding." For this bill another was substituted, drawn up by the Commissioner of the General Land-Office, reading: "Within the State of Alabama, all public lands, whether mineral or otherwise, shall be subject to disposal only as agricultural lands; provided, however, that all lands which have heretofore been reported to the General Land-Office as containing coal or iron shall first be offered at public sale ; and provided further, that any *bona-fide* entry under the provisions of the homestead law of lands within said State heretofore made may be patented without reference to an act approved May 10th, 1872, entitled 'An act to promote the development of the mineral resources of the United States,' in cases where the persons making application for such patents have in all other respects complied with the homestead law relating thereto."

The coal lands of Alabama have engaged the attention of the government officials for a number of years. On September 11th, 1878, Secretary SCHURZ detailed Mr. F. WINTER, a geologist, as special agent to investigate the coal and iron lands of Alabama ; and in transmitting the report, on August 2d, 1879, Secretary SCHURZ recommended that so far as lands shown to be mineral were concerned, they should be withheld from sale until further legislation. The report made by WINTER appears to have been hasty and incomplete. Thus, for instance, he does not include in the mineral lands territory from which the Pratt mines, now the largest in the State, are taking 1000 tons of coal per day. He estimated the government lands underlain by coal in the Coosa, Cahaba, and Warrior fields at 1,573,280 acres, of which no more than one third he reports to be valuable for mining purposes. The area underlain by iron ore he places at 224,000 acres.

The General Land-Office, in order to prevent the retarding of the settlement of the lands belonging to the government, and set aside as "coal lands," permitted the entry under the homestead laws, when the claimants testified under oath that the lands were non-mineral in character.

This, the friends of the new bill claimed, gave rise to much abuse, and their statements are corroborated in a startling way by some of its most violent opponents. Mr. J. H. PERDUE, a special agent of the General

Digitized by Google

Land-Office, in May, 1882, wrote to Secretary KIRKWOOD, in reporting on his investigations in Saint Clair, Shelby, and Jefferson counties, that not one acre out of a hundred was fit for agricultural purposes, and that yet there is little land that has not some kind of claim upon it, either in the form of a homestead entry or as a declaratory statement; and he estimated that the entries wrongfully made in Jefferson County alone aggregate 80,000 acres. There can be no doubt that the most extensive frauds were committed, a government official securing twenty indictments. The *modus operandi* appears to have been to have entries made by employés or ignorant men; to have them swear to the non-mineral character, and afterward cause the entries to be transferred to the "speculators." It is stated that one person bought in the North a package of soldiers' and sailors' homestead certificates, and by means of them secured in one day a slice of land sixteen miles long in the center of a coal-field. It is alleged that his bookkeeper made affidavits to the effect that the land was non-mineral.

Senator MORGAN, in support of the bill which he succeeded in passing, argued that the adoption of the measure would be the best means of getting over the trouble, because it would be impossible to prevent speculators from getting their lands fraudulently. He advanced the further argument that development was checked by the land granted to the Memphis & Charleston, Mobile & Ohio, Alabama & Great Southern, and Louisville & Nashville railroads, which got 15-mile alternate sections of lands along the north, west, south, and east borders, respectively, of the Alabama coal-field. These roads declined to build branches, in order to check competition of mines on other lands.

The bill was supported by the Senate and House of Representatives of Alabama, which passed a joint resolution in favor of it, dated December 12th, 1882. It received the indorsement, too, of Secretary H. M. TELLER, in a letter dated July 10th, 1882. It was, however, lukewarmly received previously by Secretary KIRKWOOD, at whose request the Commissioner of the General Land-Office, N. C. MCFARLAND, made a report in which he says:

"The policy of so disposing of the public lands that large areas will be owned by single individuals or corporations, may well be doubted, or at least merits a careful consideration. It is also to be borne in mind that a too restrictive policy is a substantial inducement to fraud, and at the best may postpone but briefly the acquisition of large titles by individuals who command the necessary capital and enterprise. This result would be more likely to occur in a State like Alabama, where there is doubtless so much land which contains coal and iron, but the amount and value of the deposits in which are so uncertain. The policy of the proposed law is one which it is the peculiar province of Congress to determine, and concerning which I prefer to make no recommendation. The proviso for public sale of the lands supposed to be valuable for their mineral deposits, I would think wise, because it will enable the government to realize the largest possible price for the lands."

The policy of converting mineral lands into agricultural lands by act of Congress was sharply attacked, and it was pointed out that the bill may be construed that those lands which have not been hitherto reported to the government as "coal lands," may be turned in, without any sale as mineral lands, simply as agricultural land, under the homestead laws, at $1.25 per acre. There is evidence that some if not considerable valuable property, may thus be secured, or has been so taken up already. A sound point raised against the bill is, that there are no provisions in it as to the size of the parcels in which these coal and iron lands may be disposed of by public sale. This is apparently left to the discretion of the Secretary of the Interior and the officials of the General Land-Office, who may decide that the best interests of the government demand the sale of large tracts only, thus making it possible only to combinations of wealthy capitalists to become bidders. It was furthermore pointed out that the proviso that "*bona-fide* entries already made under the homestead laws may receive patents" will practically legalize many if not the great majority of the fraudulent acquisitions of coal lands made in Alabama.

CORRESPONDENCE.

The Electro-Amalgamation of Gold Ores

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In your issue of March 24th, you publish an article taken from *Engineering* on the Electro-Amalgamation of Gold Ores, which seems likely once more to bring before the public the question of the treatment of "rusty" gold and the use of the electric current to assist its amalgamation. Most of the old investors in Colorado gold mines, which unfortunate country is supposed to be peculiarly infested with this "rusty" gold (and, in my experience, still more cursed with inventions to treat it), have learned by sad experience to have nothing to do with inventions for the treatment of refractory sulphurets, preferring to leave the matter to competent metallurgists; but many who have not had this dearly-earned experience may be attracted by this invention, and it is to them that I address a few lines of warning.

In the first place, not one mine in a thousand carries "rusty" gold, and the few mines that do contain a portion of their auriferous contents in this unamalgamable condition can usually get their ore satisfactorily treated by the addition of a few of the well-known chemicals, and by carefully saving the blanket tailings. The truth is, that that portion of the gold which will not amalgamate is either chemically combined with the sulphurets, or so thoroughly and thickly coated with the same, that its envelope would resist the strongest electric current ever generated in the mind of the most sanguine patent process man.

In the second place, almost all ores that carry their gold in a condition difficult to amalgamate contain enough silver and copper or silver and lead to necessitate smelting, either before or after concentration.

In the third place, instead of costing $15 per ton to smelt such ore, the real truth of the matter, in nine cases out of ten, is, that after a simple concentration, preceded or not, as the case may require, by battery amalgamation, the smelters will pay such a price for such concentrations, as a flux for other ores, as would make it more profitable to beneficiate them in this manner than to amalgamate them under the most favorable conditions.

Fourthly and lastly, and speaking only from experience, which, however, has been pretty extensive in this direction, every attempt to improve on the present system of amalgamation of gold ores, as practiced according to their respective methods in Colorado and California, has been a total failure wherever electricity has been tried; and though this by no means precludes the possibility of success in the future, it should at least serve as a warning to those who, with little or no experience of the peculiar ores that they may be called upon to handle, fancy that they can do better work than the men who have spent the greater part of their lifetime in the practical amalgamation of ores, besides keeping thoroughly posted in all improvements that have been made public, and making a point of carefully testing every thing that might seem any advance on the method they were employing.

NEW YORK, March 24, 1883. EDWARD D. PETERS, JR.,
Ass't-Manager Orford Nickel and Copper Co.,
Late Terr. Assayer of Colorado.

OFFICIAL STATEMENTS AND REPORTS.

THE PEABODY COPPER MINES, RUSSELLVILLE, ARIZONA.

We have received a copy of a report by Mr. George J. Johnson, of Boston, a mining engineer prominently connected with the copper mining interests of Arizona, on the Peabody mines, formerly the property of the Russell Gold and Silver Mining Company, but recently acquired by Messrs. Underwood & Clark, of Kansas City, Mo. The mines are located in the Cochise Mining District, seven miles north of Dragoon, Summit Station, Arizona, and include the Peabody, Copper King, Highland Mary, and Donna Anna claims, to which have been added, by purchase, the Dreadnaught, and a two-thirds interest in the Columbia, Saratoga, and Vesuvius. In the absence of the plans to which Mr. Johnson repeatedly refers in his two reports, which are dated respectively the 22d of January and the 10th of March, we can not follow his description of the mines themselves; but he gives a series of interesting data which deserve to go on record. Geologically, the mines are found in stratified dolomite. They follow the dip and strike of the country-rock, which is crossed at right angles by occasional ledges of barren quartz. The principal mine is the Peabody, in which the vein opened out by the workings, 106 feet deep, has a dip of 48 degrees. A large, irregular chimney of ore has been stoped out, forming a chamber about 30 by 30 by 45 feet; but although explored to a width of sixty feet, neither wall rock has as yet been determined, the ore-body at this point apparently extending through the limestone lying between two parallel veins. The ores consist mainly of copper glance and bornite, red and black oxide and carbonates occurring in smaller quantities. The ore of the Copper King, on a well-defined vein, contains considerable amounts of iron oxides, which make it valuable as a flux with the Peabody ore. Little work has been done on the Dreadnaught, Columbia, Saratoga, and Vesuvius, which Mr. Johnson pronounces promising claims.

The Russell Company, whose want of success was due solely to lack of working capital to properly develop its property and a total want of experience in mining matters, had a thirty-ton furnace, furnished by the Pacific Iron-Works, which was situated three miles north of the Peabody mine, on a line between the mine and Summit Station.

In his first report, Mr. Johnson calculates the net value of copper per pound at the smelter as 13 cents, assuming the average price of Arizona copper for the year as 16¼ cents refined and delivered in New York, deducting $30 per ton freight and 2 cents per pound for refining and selling. With this as a basis, which probably is now subject to some modification, unless the copper ranks high in grade, Mr. Johnson, in his first report, says, in regard to the smelting of the ores:

"The ore is easily worked, requiring as flux about 20 per cent limestone, and it has averaged from 17 to 18 per cent of copper. The slag contains less than one per cent. The operations of the Russell Company commenced April, 1881, and have been continued in a very irregular manner up to the present time. The furnace was first blown in about the middle of June last; but its operation, on account of lack of water, was very irregular up to October 1st, when a continuous run of thirty-eight days was made. The furnace was in operation in all about ninety-five days, and smelted on an average from 22 to 23 tons of ore daily, producing 122 tons matte of about 65 per cent copper, and 281 tons black copper of from 92 to 95 per cent copper. There have also been shipped during the past year eight cars selected ore, ranging from 27 to 52 per cent; average, about 35 per cent copper. Trinidad coke is used at the furnace successfully, and costs delivered $18 per 2000 pounds, each ton of coke smelting from five to six tons of ore. Ore of 15 per cent copper would net as follows: 300 pounds less 5 per cent loss = 285 pounds; at 13 cents per pound = $37.05, less cost of mining, $7, and cost of smelting, $8; leaving a net profit per ton of ore of 15 per cent of $22. Ore of 17 per cent would net as follows: 340 pounds less 5 per cent loss = 323 pounds of copper; at 13 cents per pound = $42, less cost of mining and smelting, $15; leaving a net profit per ton of 17 per cent ore of $27."

In his later report, Mr. Johnson says on the same subject: "The present cost of cord-wood of fair quality is five dollars per cord, delivered. As, however, this is not a heavily-wooded country, any considerable consumption, such as would be necessary for the treatment of from 900 to 1500 tons of ore per month in reverberatory furnaces, would soon raise

Digitized by Google

the price to from ten to fifteen dollars per cord, thereby making raw fuel an expensive article. Reverberatory furnaces have, moreover, the further disadvantages of requiring of the common furnace-man a far higher degree of skill than the blast-furnace, and of producing slags of a higher percentage of copper. Regarding the ores of the Peabody mine, which, containing the largest proportion of copper glance, are best adapted to the reverberatory furnace, I consider that the first operation may be conducted to better advantage in the blast-furnace, for the following reasons: As requiring a less degree of skill of the common furnace-man. As furnishing a slag so poor that it may be rejected without any considerable loss. As the Peabody ore consists mainly but not entirely of copper glance, and as a part of the sulphur is eliminated in the blast-furnace, the result of the first smelting operation per ton of 2000 pounds charge would be approximately as follows: Assuming the charge to contain 15 per cent copper, 80 per cent of charge, 1600 pounds, would form a slag containing not over ·75 per cent copper to be rejected as worthless. Fifty per cent of the copper, or 7½ per cent of the charge, 150 pounds, would be in the form of black copper, the most advantageous form for shipment. The remainder of the copper, 150 pounds, together with sulphur and iron, amounting in all to 250 pounds, or 12½ per cent of the charge, would form a matte of say from 50 to 60 per cent. This matte would be subject to further treatment, together with selected high-grade glance, either by roasting in heaps or stalls and returning to the blast-furnace, or probably to greater advantage in a small reverberatory, whereby the same could be brought to the grade of blister-copper. By mixing with Peabody ore the ore of the Copper King, which contains less sulphur, more carbonates, and more iron, the product would be a larger percentage of black copper and less matte, which would also be of a higher grade, thereby increasing the relative advantages of the blast as compared with the reverberatory furnace process. The cost of smelting Peabody ore in a thirty-ton blast-furnace would be as follows. The charge consists of 25 tons Peabody ore of from 15 to 17 per cent copper and 5 tons limestone as flux:

Metallurgist in charge, $300 per month—per day	$10.00	2 roustabouts, 12-hour shifts, at $3.	$6.00
Day foreman	5.00	2 engineers, 12-hour shifts, at $5..	10.00
Night foreman	5.00		
3 tappers, 8-hour shifts, at $4	12.00	Total cost of labor for 25 tons ore, 30 tons charge	$84.00
3 chargers, 8-hour shifts, at $4.	12.00	5 tons limestone as flux, at $3 per ton.	15.00
2 slag-wheelers, 12-hour shifts, at $3.50	7.00	5 tons coke at $18 per ton, delivered	90.00
2 bullion-wheelers, 12-hour shifts, at $3.50	7.00		
1 crusher-feeder, 1 shift	3.50	Total cost for 25 tons Peabody ore	$189.00
2 charge-wheelers, 12-hour shifts, at $3.25	6.50	Cost per ton Peabody ore	7.56

"By using Copper King ore together with Peabody ore, we should probably be able to smelt with little or perhaps no limestone as flux, consequently decreasing our expenses in this direction as well as smelting each ton of ore with a smaller percentage of coke. When running two furnaces, our labor account per ton will be somewhat decreased. On the other hand, the above estimates do not allow for increased expenditures per ton of ore caused by accidental interruptions of the operation of the furnace or for necessary repairs; nor does it provide for further treatment of the matte. Having carefully weighed all these considerations, I consider the fair average cost of smelting per ton of 2000 pounds ore to be $8.

"The ore of the Peabody mine contains one ounce of silver to every twenty pounds of copper on an average. On account of the expense attending the separation of copper from silver, there is little probability of being able to find a market in which the silver would be of any value when associated with copper in the above proportions. Occasional assays of specimens have been found to carry considerable amounts of gold. Possibly we may be able to sort out small amounts of ore of such a character that the relative proportions of gold and silver to the copper may be such as to give a commercial value to the precious metals."

Mr. Johnson has paid particular attention to the water supply. He has arranged for pumping a supply of 3000 gallons per hour to a reservoir of 20,000 gallons capacity, situated 130 feet above the surface of the wells, and 50 feet above any point on the pipe-line which connects the five wells available with the reservoir, a distance of 5500 feet.

The pump is a Knowles, with three-inch suction and two and a half inch discharge. From the reservoir to the furnaces, 400 feet west of the main Peabody incline, a distance of about two miles, the water will flow through a two-inch pipe. The whole pipe-line will be sunk from six to twelve inches under the surface of the ground. The cost of pumping will not exceed $8 per day, which will be more than repaid by the prices paid for water by the inhabitants of the new town-site. Mr. Johnson estimates that the total supply of water needed per day, even when running two furnaces constantly, would not be over 15,000 gallons, allowing 5000 gallons per furnace. The old furnace is in process of removal, and a second one has been ordered from Messrs. Fraser & Chalmers. The furnace building is to be of sufficient size for two furnaces. An ore-house of a capacity of 500 tons, with sorting-floors of a capacity of 90 tons, is to be erected twenty feet from the hoisting-works. A new gallows-frame for the hoisting-works, which will be twelve feet higher than the present one, is now constructing. The ore as raised from the mine will be dumped on the sorting-floor, thence the waste will fall through a chute upon the waste-dump. The ore will fall into the ore-bins below, whence it will be discharged through a chute into cars of one ton capacity each. The cars will run on a double-track tramway 400 feet in length, 60 feet elevation, and dump immediately in front of the crushers. The motive power for the tramway will be furnished by an engine of from five to six horse-power, steam for which will be furnished from the boiler used to run the engines of either furnace; thence by means of a false chute the crushed ore will fall into either of the two ore-bins provided for the two furnaces, as desired. The total expense of hauling ore from the mouth of the incline to the feed-door of the furnaces, including crushing, is estimated not to exceed ten cents per ton. The arrangements for handling coke, ores from other mines, and limestone when needed as flux, are correspondingly economical.

As for the mining developments, they are confined at present on shaft No. 1 of the Peabody to sinking the main incline; also a chute from the north drift, marked *D*, to meet the main incline. The main incline is now in the foot-wall, which is a very hard limestone, in consequence of which progress is slow. As soon as a sufficient depth has been attained to allow the replacing of the first station, developments in different parts of the main workings will be pushed energetically. Prospecting-work along the upper vein at shaft No. 5 is prosecuted for the purpose of determining the most available point for sinking a permanent incline-shaft. The incline at shaft No. 4 is now down 25 feet 6 inches, a contract having been let to sink the same 50 feet deeper, following the vein.

The main incline on the Copper King will be sunk from its present depth of 35 feet to the depth of 85 feet, following the vein.

In concluding his report, Mr. Johnson says: "I regard the whole property as being of great and permanent value, and one which may be profitably worked for many years. I estimate the monthly production of ore at 1200 tons, of an average of 15 per cent copper, and the net profit for the year commencing May 1st, when our furnace will be blown in, at from $250,000 to $300,000."

ATLANTIC MINING COMPANY, LAKE SUPERIOR, MICH.

The report of the directors of this Lake Superior copper mining company for the year 1882 has just been issued. From 189,800 tons of rock stamped in the mill, yielding 13·866 pounds of copper per ton or 0·693 per cent, there were produced 3,768,540 pounds of mineral, or 2,631,708 pounds of refined copper. The gross value of the product per ton of rock treated was $2.40·4, and it cost $1·1885 to mine, break, and select the rock, including all surface expenses and construction account. The cost of transporting by the company's railroad to the mill was 4·90 cents per ton, and the cost of washing and separating was 37·7 cents, to which added the cost of freight, smelting, and marketing product, including New York office expenses, of 30 cents per ton, carries the total expenditure per ton of rock treated to $1·9082, leaving a net profit of 49·58 cents per ton of rock, and 51·61 cents, including the interest earned.

The total number of cubic fathoms broken in openings and stopes was 10,170, costing in all $157,787.66, including 29·5 feet of sinking at $15.57 per foot, 2801·5 feet of drifting at an average of $10.05, and 9773 fathoms of stoping at $10.65. The timbering, tramming, and labor cost $43,238.63, and timber materials and supplies $6776.94, making the total underground expenses $182,764.58, from which is deducted profit on supplies, $24,926.92. The total surface expenses aggregated $66,859.03, the heaviest items being superintendence and labor, $36,778.88; fuel, $18,146.19; and supplies and materials, $7541.04. The net railroad expenses were $9307.31, of which $6435.67 were expended for labor, and $2650 for fuel. The stamp, with expenses, aggregated $70,355; labor costing $26,060.39, fuel $33,276.78, and supplies $10,375.03. The construction was small, and included one Rand drill and an Evans slime-table, costing $250. The total expenditure at the mine was $305,246, and smelting, freight, and all other expenses were $56,933.49, a total of $362,179.49. Among the expenses were $12,909.10 for freight, $34,093.15 for smelting, and $2307.89 for brokerage. The company sold 1,734,356 pounds of ingot copper, at an average price of 17·84 cents, valued at $309,469.92. There were on hand on the 31st of December, 900,319 pounds of ingot copper, which, at a valuation of 17 cents, would fetch $153,054.23. Besides this, the company had at the smelting-works 288,379 pounds of copper, valued at 14 cents, or $6242.30 less than at the same time a year ago, making the total receipts and value of stock of copper $456,281.85,; o which is added balance of interest account of $3855.67, showing a profit in 1882 of $97,958.03, and carrying the net surplus to $338,649.67, from which a dividend of $80,000, $2 per share, was distributed in February, thus making the total dividends to date $220,000, against assessments levied aggregating $280,000. The assets, consisting of cash, $47,109.75; loans, $30,000; supplies at mine, $104,886.91; and copper; foot up to $375,423.95; the liabilities being $36,774.28, leaving a balance of $338,649.67, less the $80,000 dividend.

PHILADELPHIA & READING RAILROAD AND COAL AND IRON COMPANIES.

The report of the Philadelphia & Reading Railroad and Philadelphia & Reading Coal and Iron companies, which has just come to hand, says *Coal*, contains a series of very interesting reports by the chiefs of the different departments. The railroad company carried 8,429,826 tons (of 2240 pounds) of coal during the fiscal year ended November 30th, 1882, against 8,072,142 tons in 1881, 7,179,399 tons in 1880, and 8,147,580 tons in 1879, the total tonnage, including weight of passengers and company's materials, having been 18,054,351 in 1882. The number of tons of coal hauled one mile was 679,041,172 ton-miles, and the receipts from the transportation of coal were $9,754,312.11. Of this, 628,975,470 ton-miles were paying freight, thus making the receipts per ton per mile 1·55 cents. Of fuel for company's use, there were 566,779 tons. During the same period, the company carried 7,490,883 tons of general merchandise, the ton mileage being 350,476,278, for which $6,308,066.39 were obtained, an average of 1·79 cents per ton per mile. Here also, however, the tonnage was not all paying freight, as many as 1,085,673 tons of the merchandise being for company's use. The paying mileage was 327,347,373 ton-miles, making the average rate $1.93.

Mr. J. E. Wootten reports the saving due to the use of coarse coal in locomotives to have been $236,000 during 1882, it having been $107,000 in 1881, and $30,000 in 1880, when the Wootten fire-box was first introduced. The quantity of such fuel used was 14,283 tons in 1880, 51,078 tons in 1881, and 112,823 tons in 1882; and during the month of November last, the full supply needed for all the locomotives capable of using it, 115 in all, or 16,698 tons, was for the first time procurable. In that month, the saving effected was $35,065, representing an annual saving of $420,780. For passenger locomotives, Mr. Wootten states that it is desirable to make further improvements in the apparatus for separating the slate; and when this is completed and all the freight engines now at work are reconstructed, he believes that the saving in fuel expense will foot up to $675,000 per annum. He refers also to one important point, namely, the fact that the comparatively low furnace temperature required for steam generation, when burning this kind of coal, appears to lengthen the time of service of the steel fire-sheets. He gives figures showing the mileage per number of engines fitted with the Wootten fire-box, which prove that they are doing better than the average of 120,000 miles usually attained with ordinary anthracite sizes.

The steam colliers did not do as well financially as they have done in some years; they realized a profit of $271,547.82 on the carriage of 574,931 tons of coal at the low average rate of $1.12.

The report of Mr. S. B. Whiting, Chief-Engineer, contains some inter-

Digitized by Google

esting figures. The company mined 3,363,882 tons of coal from lands owned and controlled by it, and took 747,948 tons from other lands. Tenants mined from lands owned by the company 1,156,193 tons, and from lands controlled by the company 356,766 tons. Mr. Whiting states that the collieries operated by the company are prepared to ship 5,000,000 tons; and as he computes that, if mining had not been suspended by agreement forty-eight days, the output would have been 4,900,000, it appears that the company when mining drove its plant very nearly to its full capacity. Mr. Whiting gives his usual statement showing the tonnage, expenses, and average cost per ton, at the collieries worked by the company. We copy last year's figures below, because they strikingly show how close a relation increased product and the cost per ton bear to one another:

Months.	For year ended November 30th, 1882. Tonnage.	Expenses.	Cost per ton.
December, 1881	383,939 08	$597,409.08	$1.55·6
January, 1882	240,432 15	393,671.36	1 63·7
February	202,611 02	337,334.26	1.66·5
March	270,238 04	437,785.56	1.62·0
April	298,187 05	474,117.33	1.59·0
May	285,950 11	457,521.60	1.60·0
June	339.179 01	488,417.76	1.44·0
July	396,101 05	560,482.91	1.41·5
August	416,405 18	571,661.29	1.37·3
September	377,175 18	539,361.68	1.43·0
October	441,813 16	593,798.01	1.34·4
November	459,795 02	606,929.40	1.32·0
Total	4,111,830 05	$6,058,490.24	$1.47·3

Of course, there is no mathematical rule; but it will be seen how, with a declining tonnage in December, 1881, January, 1882, and February, the cost per ton goes creeping up; how it promptly drops off in June with a larger product; reacts slightly in September; and reaches its minimum in November, which was the greatest month on record thus far for the company's collieries.

The averages for the preceding years were as follows:

	Tonnage.	Cost.
1878	2,727,608	$1.23·7
1879	4,269,929	1.14·3
1880	3,460,464	1.43·6
1881	3,937,607	1.49·7
1882	4,111,830	1.49·3

In conclusion, we give below Mr. Whiting's accident statistics:

Year.	Total tonnage.	Total serious accidents. Non-fatal.	Number of tons mined per serious accident.	Total fatal accidents.	Number of tons mined per fatal accident.
1873	1,348,838	132	10,294	44	30,655
1874	1,374,791	96	14,320	36	38,188
1875	1,510,572	80	18,882	30	50,352
1876 (11 mos.)	1,853,364	75	24,711	30	61,778
1877	3,794,529	185	20,511	45	84,323
1878	2,727,608	217	12,570	44	61,991
1879	4,269,929	238	17.941	52	82,114
1880	3,460,464	198	17,477	43	80,476
1881	3,937,608	236	16,685	33	119,321
1882	4,111,830	191	21,528	43	95,624

Year.	Number of employés.	Total serious accidents. Non-fatal.	Per cent serious accidents.	Total fatal accidents.	Per cent fatal accidents.
1873	5,000	132	2·64	44	0·88
1874	8,000	96	1·20	36	0·45
1875	9,000	80	0·89	30	0·33
1876	9,110	75	0·82	30	0·33
1877	11,428	185	1·61	45	0·39
1878	10,630	217	2·04	44	0·41
1879	12,661	238	1·88	52	0·41
1880	13,093	198	1·51	43	0·33
1881	13,509	236	1·75	33	0·24
1882	13,705	191	1·39	43	0·31

THE CELY IRON REFINING PROCESS.

At one of the meetings of the Société de l'Industrie Minérale, at St. Etienne, France, M. Thiollier gave the results of a series of preliminary experiments made to test the process proposed by M. Laurent Cely, to refine iron, steel, and pig by the action of moist hydrogen. It is well known to chemists that, when a current of moist hydrogen is allowed to pass through a porcelain tube containing impure iron, heated to a temperature ranging between dark and cherry-red, the impurities of the iron are carried off. M. Thiollier, in order to test the reactions on a larger scale, has built a small experimental plant near Paris, in which he has four muffle-furnaces, of different shapes, capable of together treating one ton of metal. The cast-iron muffles are covered internally and externally with an enamel having alkaline silicates as a base, in order to protect them against oxidation externally, and the action of the hydrogen internally. The muffles or retorts are charges, and the joints, which are outside of the furnace protected from the heat, are luted. The hydrogen is introduced through small pipes, the quantity required being small only; and special precautions are taken to prevent explosions, a current of carbonic acid gas being put through the muffle after the hydrogen has acted upon the iron. While the hydrogen is passed through, the muffle is heated. M. Thiollier has evidence of the efficacy of the process, but has not yet completed his series of analyses. He states that malleable iron, after a few hours' treatment, has all the properties of steel, and is capable of being forged, welded, and hardened. Steel irregularly cemented is transformed into a uniform metal, and wrought-iron is similarly, though slowly, improved. He has tested the process, so far as wrought-iron is concerned, on poor wire particularly. M. Thiollier estimates the cost at two francs per one hundred kilograms.

SETTLING-TANKS IN SILVER MILLS.*

By Albert Williams, Jr., Washington, D. C.

A large proportion of the work performed in wet-crushing silver mills is devoted to the handling and re-handling of pulp between the battery and the pans. There seems to be no generally applicable substitute for the settling-tanks; and in the present system of constructing mills, the tanks involve an amount of labor which may be regarded as disproportionate and unnecessary, in view of the automatic improvements which have been introduced in other directions. This difficulty has been met, however, by Boss's continuous process, in which the pulp flows directly from the mortars to the first of a series of constantly working overflow-pans. This method has been adopted at the Noonday mill, Bodie, California; the Harshaw, Arizona; the Sierra Grande, New Mexico; and the Prietas, Sonora, Mexico. The continuous process, while giving excellent results with special ores, and under peculiar local conditions (such as a deficiency in water supply), is not, I believe, claimed to be available for all raw-amalgamating mills, notwithstanding its well-merited popularity for certain work. Some trouble has been experienced from the tendency to concentration in the pans; though this can be avoided by skillful manipulation. It has also the disadvantage inherent in combinations of distinct operations: it requires a very nice adjustment of the water supply to obtain full battery efficiency without running the pans too thin; although the latter defect is partially compensated for by the gradual thickening of the pulp as it proceeds through the series of pans. The objection is similar to that which holds in a parallel duplex process, that of combining roasting and smelting in a single furnace, where each operation is injuriously affected by the necessity of fitting it in with another and entirely different one.

In the prevailing type of wet-crushing silver mills, the battery sands, after settling, are manipulated in one of the three following ways: They are either shoveled into wheelbarrows or cars, and thus conveyed to the pans; or they are dumped in heaps upon the platform immediately back of the pans, from which they are again spaded into the pans; or, if taken from the row of tanks nearest the pans, they are sometimes thrown directly from the tanks into the latter by a single handling. Each of these methods may be applicable in a single mill, according to the arrangement of the tanks relatively to the pans. All involve hard work and the employment of many men. Thus, of the force employed in the six Comstock mills (the Brunswick, California, Mariposa, Morgan, Scorpion, and Trench), which numbered in 1880 215 men, no less than 49 were tank-men; and of the crews of two mills in Owyhee County, Idaho (the Ellmore and Jones & Adams), 6 were tank-men, out of a total of 19. The wages were $4 per shift of ten and twelve hours. These eight examples show that 24 per cent of the labor in the mills named consisted in handling the tank-pulp. The instances cited include all the data I have at command, and probably show a fair average of the practice in mills of the same type. Remembering the notable saving which has been effected in other details of modern amalgamating mills, it appears that here is a possible opening for improvement.

The object of this paper is to throw out a hint which may invite discussion, and may suggest to the builders of the mills of the future a remedy for the existing clumsy, slow, and expensive mode of handling tank-pulp. Instead of the laborious shoveling of the heavy, tenacious pulp to higher levels from the tanks, why not utilize the always obliging force of gravitation? This is already done in passing the ore from the bins successively through grizzlies, rock-breakers, and ore-feeders to the stamps, and in settling the pulp; and after leaving the pans, the pulp flows downward to the settlers, and thence to the agitators and sluices. In all these stages, the movement is steadily downward, and is effected by gravity: it is only when the settling-tanks are reached that an interruption occurs. Suppose now that, instead of the ordinary tanks, we introduce a series of hopper-shaped boxes provided with gates at the bottom, placing the pans from 6 to 10 feet below the usual level, and discharging the settling-boxes into movable troughs leading to the charging-holes of the pans. The position of these self-dumping tanks would be the same as that of the ordinary ones; the grade of sluices from the battery to the tanks would not be changed; and the arrangement of overflow-gates would be identical. The tank capacity could also be kept the same, while diminishing the area; for the capacity of the common tanks is determined by the limit of depth from which a man can conveniently shovel; this depth ranging in present mills from 24 to 40 inches, and seldom exceeding 30 inches. The proposed system would allow the compartments to be smaller in area because of their correspondingly greater depth. The gates at the bottom of the tanks could be actuated by levers extending above the pan-floor. Perhaps the best arrangement would be to employ hinged bottoms surfaced with burlap, sheet-rubber, or other packing. Any slight leakage would not be objectionable; for the water would be strained as it escaped, and all drippings would collect in a large fixed trough underneath the tanks, from which the water could be conducted to the slime-ponds, or used in diluting the pan and settler charges. The details of construction can be elaborated by any mill designer.

The plan of using gravity-discharging tanks is open to certain objections. It demands steeper grades inside the mill, to allow room for a half-floor beneath the tanks and give sufficient fall for the sluices from tanks to pans. The work of excavation for foundations would be increased, and the mortar-beds would need somewhat heavier backing. On the other hand, the area accupied by the building could be slightly reduced. The expense would depend on the natural grade of the site. For a twenty-stamp mill, the addition to the first cost (given a favorable site) should not exceed $1000—an amount which could be saved in wages of tank-men in a three months' run.

THE Italian government has limited the export of iron ore from the island of Elba to 250,000 tons annually. The output in 1880 was 287,680 tons, from six mines, employing together 1200 men at two francs per day, being 69,425 tons more than in 1879. The ore is exported by contract with the government by the Elba General Miners' Bank of Leghorn, Italy.

THE LIEVENS SAFETY-CATCH.

THE LIEVENS SAFETY-CATCH.

At the recent annual Agricultural Exhibition in Paris, MM. Lievens and Crespin showed a safety-catch for elevators and cages which possesses some features distinguishing it from devices of a similar kind used in this country. The *Revue Industrielle*, from which we have borrowed the accompanying engravings, speaks of it as having attracted a considerable share of attention. The cage consists of two parts, having an independent motion vertically, but connected with one another through the levers *E*, *G*, Figs. 1 and 2, which constitute the brake. The one part is formed of the platform *C*, Fig. 1, suspended by the frame *D* from the hoisting-chain or rope, and bearing the bolts *E*, Fig. 1, to which one end of the brake-levers *G* is attached. The other movable part of the cage consists of the beam *F*, Fig. 2, which carries the guide-rollers, and to which is attached the other end of the levers *G*. The hoisting-rope is fastened to the chain which is attached at *H*, Fig. 2, and does not touch *F*. At *K* and at *L*, Fig. 2, the frame *F* carries rollers which grasp the two sides of the guides, while a third roller, seen in plan in Fig. 4 and in elevation Fig. 3, slides along the other surface, thus securing easy running. As is shown in Fig. 3, the lower part of the frame has the bearings *O* for the brake-levers *G*.

The principle of the working of the safety-catch is the relative movement of the two parts of the cage. This movement is limited by the springs *P*, Fig. 2, which connect the two frame-beams *F* and *D*. When these beams are near one another, the brake-levers do not touch the guide *U*; but as soon as the distance becomes greater, the platform *C*, and with it *E*, drop down, and the brake-levers at once take hold. When the cage is suspended by the rope, the platform *C* and its frame support the guide-roller frame *F*, with the aid of the springs *P*, and the frame *F* by its weight occupies a position close to *D*, thus keeping the brake disengaged. As soon, however, as the rope breaks, the platform drops faster than the brake and guide-roller frame, and the brake-levers act promptly, the weight of the cage and load tending to give them a better grip.

LAKE SUPERIOR COPPER INTERESTS.

Special Correspondence of the Engineering and Mining Journal.

Sympathizing a trifle, perhaps, with the depression in the demand for the raw and manufactured products of iron, and to a certain degree itself dependent upon this demand for a market, copper enters the new year with less inspiration than at any time since 1879. Bids for ingot have scarcely risen above 18¼ cents, and although the price asked during the last week in January was 18½ cents, it is not probable that the average sales thus far will reach any thing beyond 18 cents, if, indeed, they touch that figure. Prices as a rule fall off when navigation opens and overland transportation is discontinued, so that we may look for lower prices by June, unless the electric light companies, underground telegraphy, a revival of locomotive building, and other multiplication of uses for the mineral come to our rescue. During the month of January last year, the prices paid for ingot reached 20½ cents, and for the first three months would not average below 19⅛ cents. This difference, insignificant in small transactions, is an immense bolster to the successful operation of a mine, when the aggregate annual production reaches pounds in the millions. A difference of two cents a pound would have made a difference of $80,000 to the suffering Pewabic in her cupriferous resources for 1882, over $60,000 to the Allouez, over $80,000 to the Osceola, much over $100,000 to the Quincy, and considerably over $600,000 to the Calumet & Hecla, that eighth wonder of the world. This is of no practical consequence to the Calumet & Hecla, which would only have to sweat a little to make up its return of $2,000,000 per annum to stockholders, even if the price of copper should fall to 15 cents; but it must be remembered that this mine is entirely exceptional, requiring no parsimonious economy—nor practicing it either, for that matter, it is to the great credit of its management to say—and presenting in its underground workings no problems except deep and rapid hoisting and the timbering of the chambers stoped out by its thousand employés. With the Atlantic, for instance, however compared with which the Calumet & Hecla yields over seven times as much

copper per cubic fathom of rock, a fall to 15 cents average would mean a suspension of dividends, if not of operations; and as for the Keweenaw mines, it would mean either a new harvest of assessments, or, what is worse, a new era of tributers, or, what might be worse, but would probably be better, a stoppage of machinery until a revival of prices. The market is now overstocked, although not glutted, with ingot; but prices have been maintained thus far by combination, as that production is more or less self-supporting; nor do dealers generally desire any reduction in prices, unless it be the brass founders, who are hankering for markets "beyond seas." The apathy of the market is due, therefore, not to ruling quotations, but to a stagnation in the demand for cupriferous wares. Certainly prices for lake ingot ought to fall no lower than advices from brokers put them at this week; for the margin by means of which the industry is carried on is already so meager that our American mines can hardly stand on their feet, even with the protection afforded them by our Washington Solons. And unless the price does take a rise from present rulings, the danger of this region suffering from competition with Western ores will soon be eliminated, since a fall of lake to 15 or 14 cents would mean only a shilling for Western brands; and as it now is, with the exception of one mine, the Copper Queen, these properties are said to be already in the early stages of dissolution.

However this may be, there is probably no industry in our country where operations are conducted on a closer shaving of profit, where greater executive ability and foresight are demanded, where the greatest possible results must be obtained from the smallest possible outlay, than in the mining of copper. Of course, this will not apply to the Calumet & Hecla, which yields about six per cent mineral per ton, and is rich beyond even fabulous competition; but, as already remarked, this wonder of the world is unique, entirely exceptional, and ought not to be at all considered in determining protective rates for copper production. There are at least twenty other mines among us—average mines, with approximately equal prospects—but the repository of an enormous outlay of capital already expended, the existence and operation of which are at least deserving of consideration. Of the better class of these, the Atlantic yields only a trifle over seventy one hundredths of one per cent of mineral per cubic fathom of ground sent through the stamps; and this amount again is reduced by a large per cent when the mineral is sent through the smelting-works to produce ingot. The Allouez makes a showing of less than one per cent, the Copper Falls about ·83 of one per cent, and even the magnificent Osceola only a trifle over 1·29 per cent. In some of the mines, vast quantities of rock must be sorted and thrown away on the burrows which wind off from the shaft-houses, before any boulders can be discovered which are at all worthy of being thrown into the crushers and ultimately treated in the stamps and wash-houses. Iron and copper mining have little in common. Iron mines require no such plants as are from the very start essential to the production of copper. A good derrick, "mast and boom," in mining parlance, or donkey engine, with a few thousands of ready money, can make a fair start at mining iron; and as a rule, a Webster, Camp & Lane hoisting-drum of moderate size is adequate to all the hoisting exigencies of the case. With copper, however, and especially since prices no longer yield bonanza profits, the most expensive and enormous machinery must be put in from the start in order to make the property at all self-supporting, to say nothing of being profitable. Air-compressors, machine drills, high explosives, massive drums for deep and rapid hoisting, stamps which strike the rock with the force of a hundred tons, well-elaborated facilities for the scientific treatment of the rock in mills and tail-houses, are one and all the imperative accompaniments of beginning operations. A lack of any one of them will cripple the mine; a want of two or three will make the mine a constantly increasing burden to its owners. For example, the Conglomerate, which is rebuilding on the site of the old Delaware, finds it necessary to expend in the neighborhood of a million—of which nearly three quarters is already invested—before it will be ready to return a "copper" to its proprietors. I ought to say, by way of parenthesis, that the whole mining plant, when I visited it some time since, presented one of the finest appearances of any mine in the whole lake country. A railroad to Lac la Belle, and a mill of Ball stamps are just now in process of construction. If the finest of shaft-houses, trestle-works, skip-roads, and handsome locations can make the enterprise successful, certainly the Conglomerate is destined to a proud place among our Michigan mines. What is the result of the Philadelphia meeting of the stockholders of this property—this week, I think—I have not yet learned. The future of the Conglomerate is enigmatical: the lode is very wide, and much poor ground must be broken to get what little copper the lode contains. Certainly, a liberal outlay of money must precede any realization at all from the money already invested; but as the lode is moderately charged with copper, perhaps 1½ per cent, it is highly possible that the property will one day make remunerative returns for moneys already and hereafter to be invested.

In fact, it is a lack of proper equipment that makes the mines in the neighborhood of Houghton—all of which, if I am not misinformed, yield a better showing of ingot than the Atlantic—such expensive elephants on the hands of their stockholders. The Allouez, lacking only facilities for transportation and treatment, is positive proof. A liberal donation from the stockholders of this property, which would purchase a new locomotive, fix up the stamps, put on a fleet of new cars, and open up the mine with proper reserves, would be far better than dribbling along with fifty cents this year to meet deficiencies, and fifty cents next year to meet the same inevitable deficiencies, which do and must occur with present methods of working such a lode. The Allouez is now in good paying ground, although the drifts north of No. 3 shaft do not meet expectations at the seventh level, nor does the bottom of the shaft expose as much copper as the trend of the mineral led its operatives to expect; but what with stoppage from storms, repairs of what once was a locomotive, and other stumbling-blocks to which I will not now refer, there are halts in operations at the mill, and this means a painful halt in the already painful march to self-support and remuneration. The tributers left the Allouez with little workable ground opened up, and the mine has since been slowly recovering from the attack always so paralyzing from this source. The mining captain is pushing the work of opening up the mine's resources, although the peculiar geological construction of the lode, together with the company's available resources, makes the opening of "reserves" at present, at least, very up-hill work. If a few disturbing factors could be eliminated, the Allouez would undoubtedly take its place among the remunerative properties of this region; but as matters now stand, that day is yet to dawn.

And what is true of the Allouez is true, with some shades of difference, of the Phœnix, Copper Falls, Conglomerate, and the Houghton mines, especially if prices for ingot reach a lower average—as is quite likely—than last year. It was hard work for these properties then, with copper at 18½ cents; and should the change in the tariff and the increased importation of Spanish and Canadian pyrites and Chilian bars glut the market and sicken the price to an average in the neighborhood of 16 cents or less, there can be little doubt but that the best place for copper stocks will be in somebody else's pocket. It is not the Calumet & Hecla that needs protection: this mine could compete with the Spanish and Chilian mines on the open sea of free trade. But this corporation represents less than one tenth of the number of shares in lake copper mines, many of which have been far more expensive than the original cost of Calumet stock, and have not been at all remunerative. It will not do to say that this is one of the accidents of trade, one of the incidents of speculative enterprise; if we are to encourage the investment of capital in the development of our mineral resources, the protection ought to be on a basis that would allow the average mine to yield a moderate return, both in wages to employés and profit to employer. The Calumet & Hecla, which is exceptional, needs no protection; but the other twenty mines, which are the great rule, do, or they must cease to exist. Inadequate protection is mockery and deceit; for with no pretension to protection, capital would not be beguiled into insane investments, which is the one result of a pretended policy of protection. Of the real merits of this pudding, however, more can be said after we have chewed on it for a few months.

The report of the Pewabic has just reached me, and shows for the past year cash receipts, including amount carried over from 1881 and the assessment of $2 per share, and which realized the company $57,500, of $678,928.14. Of this, all has been paid out for loans and contingencies, so that only a trifle over $16,000 remained in the treasury as the resources for starting the heavy expenditures of the current year. I notice a falling off of 0·40 of one per cent in the metalliferous production of the ground passed through the stamps, which is a serious matter. The agent, Mr. Johnson Vivian, every way a capable and honorable miner, has done all that human skill could do with his resources and the disheartening outlook under surface; nor is he now able to see how, in the present yield of the stopings, even the present meager product can be maintained. And yet it is possible that the Pewabic will one day be a veritable bonanza to its owners, although that day is far distant.

SPECULAR.

WAGES IN SHEFFIELD.

Mr. Robert P. Porter, as special correspondent of the *Tribune*, gives the following figures as the average present weekly earnings of the thrifty workman of the Sheffield District who works full time:

Rolling-Mills.			
Puddlers*	$7.50	Bogie-men	$5.35
Puddlers underhand	5.50	Hammerdrins	7.50
Shinglers or hammer-men*	12.00	Pattern-makers	7.00
Shinglers' Assistant	8.00	Molders	7.50
Ball furnace-men*	12.00	Fitters	7.00
Ball furnace-men underhand	6.00	Laborers	5.00
Charcoal lumpers*	12.50	Iron nailers	4.00
Rollers*	12.75	Spring-fitters	9.00
Rollers' assistant	7.00	Assistant	5.00
Metal refiners	11.00	Tire-rollers	9.00
Plate-rollers*	14.50	Machinist (best)	8.50
Firemen	7.50	Machinist (ordinary)	7.50
Furnace-men*	12.50	Machinist (inferior)	6.00
Forge-men*	12.50	Rivet boys	1.20
Lever-men	7.50	Engineers	7.00
Electro-Plate Trade.			
Stampers	$8.00	Buffers (women)	$4.00
Piece-workers	8.00	Chasers	9.00

PROGRESS IN SCIENCE AND THE ARTS.

Utilization of Pyrites Refuse for Steel-Making.—Experiments are now making at the Terrenoire works for utilizing the residue of iron pyrites. Briquettes are made with the pyrites conglomerated with hydraulic lime; and, by simple exposure to the atmosphere, an ore is obtained which is said to yield pig excellent for steel-making purposes. The sulphur is believed to be completely counteracted by the lime, and there is no phosphorus. The company has large banks of pyrites refuse that it has hitherto been unable to utilize.

Panclastite.—The nihilists are reported to be considerably interested in a new explosive that is making quite a stir in Europe. It is the invention of Eugene Turpin, and glories in the name of "panclastite" or "brise-tout." It is said to be composed of two liquids, each non-explosive when alone, but when mixed together, just as wine and water are mixed, a fulminating compound is produced which can be exploded either by ignition or percussion. Experiments made at Cherbourg by the iron plate and the lead cylinder tests showed it to be much more powerful than dynamite, while by trial it was shown to be much less sensitive to a blow.

An Ancient Peruvian Bronze Chisel.—At the meeting of the French Academy of Science on February 6th, M. Boussingault submitted to the members a bronze chisel harder than copper and not so hard as iron, composed of 95 copper, 4·5 tin, and traces of lead and silver. It is a specimen of the metallurgy of the Incas before their conquest by Spain, and has served to work the stone of Peru. It was found on the high-road between Quito and Cuzco. As to the supposed hardening that was given to bronze, M. Boussingault declared that he knew nothing of it, and had never been able to produce it.

The Gjers Soaking-Pit.—The soaking-pit processs of Mr. John Gjers continues to give excellent results. In one week, at the West Cumberland Iron and Steel-Works, Workington, where it is in full swing, they put 2572 ingots, weighing 2391 tons, through fourteen soaking-pits, and made 2176 tons of rails and 77 tons of blooms. The rail-mill worked eleven shifts. The ingots put through the soaking-pits were cogged direct from them to 8-inch blooms; they were then reheated and rolled into rails. Three second heating furnaces were used, and the mill work was done with one cogging and one finishing engine.

Underground Wires in England.—Mr. W. H. Preece, F.R.S., in a recent paper says, speaking of the post-office system: "Wires are almost invariably carried underground through towns. Copper wire insulated with gutta-percha, incased in iron pipes, is the material used. There are 12,000 miles of underground wire in the United Kingdom. There is a great outcry for more underground work in England, owing to the destruction to open lines by gales and snow-storms; but underground telegraphs, wire for wire, cost at present about four times as much as overground lines, and their capacity for the conveyance of messages is only one fourth; so that overground are, commercially, sixteen times better than underground wires. To lay the whole of the post-office system underground would mean an expenditure of about £20,000,000. Hence there is no desire to put wires underground except in towns. Besides, snow-storms are few and far between; and their effects are much exaggerated.

An Automatic Clock.—There is an automatic clock at the London Stock Exchange, which has now performed very well for six months, invented by M. Dardeme. The winding apparatus consists of a small windmill, fixed in a chimney, or any other place where a tolerably constant current of air can be relied upon. By means of a reversed train of multiplying wheels, this windmill is continually driving a Huyghens endless chain *remontoire*, a device well known to clock-makers. A pawl acting on a wheel prevents the motor from turning the wrong way, and, by a simple arrangement, whenever the weight is wound up right to the top, the motion is checked by a friction-brake automatically applied to the anemometer by the raised weight lifting a lever. When the weight is thus raised to the top, the clock has a sufficient store of energy to go for eight days or more, so that it will be seen that it is by no means dependent on a regular current of air. The Belgian government has for the past two years adopted this system of clocks on the state railroads, and we are informed that they are now testing by certain English railroad companies with a view to their adoption.

Long-Distance Telephoning.—Our bright contemporary, the *Electrical Review*, referring to the experiments with the Hopkins transmitter and the Dorrance and Baxter telephones, says: As a matter of fact, when the conditions are taken into consideration, there is very little of the extraordinary in these experiments. It must not be forgotten that the line wire employed was such a one as has never, until now, been constructed; a wire that on its last resistance measurements measured but 1½ ohm per mile, and that for its size and conductivity has a very low electrostatic capacity. By the use of such a wire, we have no hesitation in saying that conversation could be readily carried on between the two terminal points, using an ordinary Bell magneto-telephone as a transmitting instrument. Neither must it be forgotten that no switch-board intervened between the talking parties at both ends of the line, and that, above all, no short subscribers' lines were hitched on at both ends, with a central office operator stationed at the junction point, and a well-meaning but plot-marring subscriber at the end of each short line. Experimentally, we can do almost any thing; but doing it experimentally and commercially are very different things. We are reminded of the old saying of Professor Morse, who, before he would consent to go into any thing new, would satisfy himself not only that it was practicable, but also that it was practical. The uniform success of all telephones which have been operated over this Cleveland line point, we imagine, to a sound moral, namely, that to communicate by telephone successfully over very long distances, the class of construction employed and the character of the conductor are elements fully as important as the instruments whereby the message is transmitted or reproduced.

THE COPPER PRODUCT OF CHILI AND BOLIVIA.—According to advices from Valparaiso, the comparative exports of fine copper from Chili and Bolivia to all parts of the world during the following years were, in tons:

1882.	1881.	1880.	1879.	1878.	1877.
43,128	38,160	43,135	49,560	46,931	45,561

The relative proportions of the different descriptions of copper being:

	1882.	1881.	1880.	1879.	1878.	1877.
Bar copper.....	84·611	82·276	80·76	80·10	82·65	75·325
Copper regulus...	13·768	15·820	16·29	17·20	15·47	18·682
Copper ore.....	1·621	1·904	2·95	2·70	1·88	5·993
Total...	100·00	100·00	100·00	100·00	100·00	100·00

STEEL CASTINGS.—The process of manufacturing steel castings, says Sergius Kern, in the *Chemical News*, is very carefully kept secret at all works engaged in such a business. We have had several interesting papers by M. Pourcel, of Terrenoire, France, but he gives nearly nothing about the *modus operandi*. We understand well that a man is not expected to say every thing about his method, if it brings him dollars and cents. In Russia very few steel castings were made at some works, and these may be called only experimental. Information was lately received of a process of molding for steel casting, the invention of Mr. George Cowing (*Journal of the Iron and Steel Institute*, No. 2, 1882, p. 731). Quartz from Finland (a very pure specimen) was calcined, ground to a rather fine powder, and mixed with from 2 to 3 per cent of glue-water and flour. This was used for molding. As a facing, fine quartz powder, with a small quantity of graphite well mixed with water, was used. The steel was prepared as follows: 80 pounds of good iron, containing about 0·10 per cent of carbon (it is proposed to use soft basic steel), were melted in a crucible; and next were added 2 pounds of silicon pig-iron, containing 6·5 per cent of silicon, and 0·5 pound of ferro-manganese, containing 75 per cent of manganese. The metal was kept in the furnace, with the alloy, for about fifteen minutes, and it was next poured into the molds. The castings had a very clean surface, and were good. Mr. Kern holds that the clean surface depends much upon the molding material. There is certainly a reaction between the silica and the gases. Secondly, as the quartz *expands* by heat, it gives a free passage to gases, and at the same time compresses the casting.

A PROSPEROUS AUSTRALIAN TIN MINE.—The directors and officers of the famous Mount Bischoff Tin Mining Company have just made their report for the six months ended December 31st, 1882. The accounts submitted at the previous general meeting showed a balance to the credit of the profit and loss account of £45,939 7s. 8d., and a further sum of £60,384 7s., being the earnings of the last six months, has since been transferred to the credit of the account, making a total credit of £106,323 14s. 8d. Of this sum, £54,000 have been distributed in dividends, and £2025 have been paid for dividend tax. In accordance with previous practice, the directors have caused to be written off the undermentioned accounts various amounts at the rate of 20 per cent for depreciation in value: Plant account, £6497 1s. 1d.; furnace plant account, £298 11s. 10d.; office furniture, £46 9s. 11d.; and horses, £36 0s. 4d. After providing for these deductions, there still remain to the credit of the profit and loss account a balance of £43,370 11s. 6d. The mine manager reports that the full number of stamp-heads was kept at work during the first four months; but after that, as the weather kept dry, he had to economize and use only sufficient to work fifteen head. The number of tons treated during the half-year was: By the 40-head battery, 14,401¼ tons; and by the 15-head battery, 7204¼ tons, together with 3118 tons of sand sent down from the sluices, making a total of 24,724 tons. The quantity of ore obtained during the last six months was 1420 tons; and since the formation of the company, 15,604 tons. Mr. W. L. Jenkin, the smelting manager, reported that the quantity of ore smelted was 1655 tons, yielding 1158 tons 17 cwts. 1 qr. 22 lbs. of refined tin. Of this, 1393 tons 8 cwts. 0 qrs. 10 lbs. of ore, yielding 975 tons tin, were smelted on account of the Mount Bischoff Company, and the remainder, 262 tons ore, producing 183 tons 17 cwts. tin, on account of the public. The average assays, as compared with those of the previous half-year, are, he continues, higher, the No. 1 ore yielding a fraction over 1 per cent more, while the No. 2 ore is about nine tenths of a unit less. The average assay of the refined metal is also a little higher, while that of the slag is a fraction lower. The smelting cost may have somewhat increased, in consequence of the excessive quantity of iron the Bischoff ore contains in its matrix, much of which is reduced with the tin, and necessitates long and careful refining to bring the metal up to the very high quality as shipped.

THE PROFITS OF THE TELEPHONE.—At the annual meeting of the Bell Telephone Company, held at Boston on the 27th, the reports made showed the rapidity of the development of the business the past year. The total earnings for the year amounted to $1,576,031.57, against $1,001,924.91 the previous year. The expenses were $603,987.29, against $439,862.76 the year preceding; net earnings for the year, $972,044.28; balance of income from previous year, $126,034.58; total, $1,098,078.86. The total of the previous year was $606,555.01. Dividends paid, $595,000; carried to surplus account, $334,997.32; balance of income account, $168,081.54; total, $1,098,078.86. The increase of interchanges of telegraphic union doubled last year. The sales of instruments for export decreased and are likely still further to decrease, as foreign countries are making good instruments of their own. The royalties from manufacturers now go to the manufacturing branch. Local companies in New York, Chicago, San Francisco, and Boston are all paying dividends. All of the Dominion of Canada, exclusive of Newfoundland, is supplied by the American Bell Company, and dividends are to be expected from Canada. The legal expenses of the company have been heavy during the year. The report of the treasurer congratulates the company on the fact that the courts have decided that the Dolbear condenser telephone receiver, so-called, infringes on the Bell patent, and an injunction has been issued; also upon the opinion of Justice Gray that the Bell patent has all the breadth that has been claimed for it, and covers microphones and instruments that employ electrical undulations. The People's Telephone Company, using a carbon transmitter, has set up lines in New Jersey, and the report says that an action on the case called forth the most careful examination that has

Digitized by Google

ever been given to the principles of the various instruments, and gives additional proof that the microphone and other things claimed under the Bell patent are authorized. The case has since been decided in favor of the Bell Company. The underground wires in Boston have been found to transmit distinctly only for short distances, and it will be necessary to devise further improvement before they can be made available to any extent. It was voted that the capital stock of the company be increased from $7,800,000 to $9,800,000, and that new shares be allowed on the basis of one new share to each holder of the old ones.

IRON AND COAL IN ALABAMA.—The Birmingham (Alabama) *Iron Age* says: The projected coal road, from Birmingham to Mobile, when completed, will be of immense value, not only to Mobile, Selma, and Birmingham, but to the entire State of Alabama. From Mobile to Selma, it opens up, in part, a rich agricultural country well suited to stock-raising and farming, a fine belt of pine timber, equal to any in the State, passing near the salt springs and wells in Clark County. Fifty-seven miles will connect the Grand Trunk Railroad and the Selma & New Orleans Railroad, so-called, giving a continuous line of rail from Mobile to Selma and to Briarfield, on the line between Bibb and Shelby counties. We are informed that a very strong railroad company has been organized, and it has a corps of engineers in the field running lines and locating the route through the lower pocket of the iron and coal-fields between Briarfield and Birmingham. It is thought the road will pass through the center of the coal measures spreading for miles on both sides of the Cahaba River, tapping the East Tennessee, Virginia & Georgia Railroad at or near Briarfield iron-works, north of Selma. There are only fifty-seven miles of the new road to build to connect Mobile, Selma, and the Briarfield iron-works by rail. From Briarfield, the company will branch off in the direction of Birmingham, and it will only have to build the road twelve miles to reach the mouth of Dailey's Creek, the center of the finest coal measures in the State. In constructing this portion of the road, it will pass near the iron-works of Clark Underwood & Candle, now in process of construction—heretofore called the Bright Hope Iron Company—on the falls of the Little Cahaba River. The Bright Hope iron ore-beds and the Briarfield ore-beds cover the lower pockets of iron beds in the State of Alabama. All of these beds are the finest brown hematite ores, surpassed by none in the State, and are in great abundance. There are only sixty-nine or seventy miles of new road to build to connect Mobile by rail with the mouth of Dailey's Creek, at the head of the Lillie Shoals, on the big Cahaba River, in the center of the lower pocket of the finest coal in Alabama, and in great quantities, which for ages can not be exhausted. The coal measures cover several miles on both sides of the river; the coal is hard, and susceptible of bearing transportation any distance, is superior to any in Georgia, Tennessee, or Alabama for grate fuel, and equal to any for gas, coke, or steam. These coal measures are the nearest coal to Mobile and the Gulf of Mexico. What will be the future of Mobile when this coal road is finished? It will make it the emporium of coal in the Gulf of Mexico, to furnish the shipping of all the West India islands, the sea-coast of Mexico, and South America. It will make Mobile a large sea-coast manufacturing city.

FURNACE, MILL, AND FACTORY.

The Cope & Maxwell Company, of Hamilton, Ohio, has sold out, and has been succeeded by the Gordon & Maxwell Steam Pump Company.

Amherst furnace, in Amherst County, Va., has gone out of blast for repairs after a long run.

Callia furnace, in Botetourt County, Va., has been repaired and improved and will very soon go into blast.

John Leighton, President of the Chattanooga Steel-Works, has gone to Philadelphia, to make extensive purchases of machinery for these new works.

The Lake Shore Tube-Works is the name of a new manufacturing establishment about to be erected in Pittsburg. The object of the company is the manufacture and sale of wrought-iron tubes and pipes. The new concern will be a rival of the National Tube-Works, at McKeesport.

The Belmont blast-furnace, at Wheeling, finished the working up of the stock of material on hand last week, and was shut down. The furnace will not be relighted until the latter part of May, as there is now metal enough on hand to supply the works until about the first of June.

The Lane & Bodley Company, of Cincinnati, well-known and extensive manufacturers of machinery, has recently acquired additional factory accommodations, and will soon be able to add 100 men to its working force. It has filled orders during the winter for several stamp-mills, ranging from 10 to 30 stamps, for different sections, and now has nearly ready for shipment a forty-stamp mill outfit to go to Georgia, and another ten-stamp mill which will go to Colorado. With its increased facilities, it hopes to meet the demands of this growing branch of its extensive business.

The Swift Iron and Steel-Works and the Riverside rolling-mill are running double turn in all departments, with prospects brightening.

The Jarvis Furnace Company, Boston, Mass., has been setting a number of its furnaces under steam-boilers, in the West Indies, to burn wet bagasse, or sugar-cane trash, without drying. The system has proved successful, and the company has received this week orders for a large amount of work, to begin when the present crop is completed.

Major A. B. de Saulles has resigned his position as superintendent of the Dunbar Furnace Company, and on April 1st will move his family to Sunny Brae, near Oliphant. Mr. de Saulles will, after April 1st, be general superintendent of the works of the Fayette Coke and Furnace Company, at Oliphant station, in which he is largely interested. He still retains his interest in the Dunbar Company, and is a director in it. Harry W. Hazard will take his place at Dunbar as general superintendent.

R. D. Wood & Co. have closed an order for 37,000 feet of street mains from the Gate City Gas-Light Company, of Atlanta, Ga.

A. L. Archambault, steam-engine works, Philadelphia, recently placed two of his vertical engines in the Rome Merchant Iron-Mill, Rome, N. Y., one 20×22 and the other 22×24.

A new iron steamship, built by the Jackson & Sharp Company, Wilmington, for Rodriguez & Brother, Sagua la Grande, Cuba, was launched on Thursday. She is 100 feet long, twenty-three feet beam, and eight feet hold. After receiving her machinery at Neafie & Levy's, the vessel will be used for passenger and freight traffic in Cuban ports. The company will soon begin work on the new steamer for the Electric line. She will be 155 feet keel, 166 feet over all, 33 feet 7 inches beam, and 8 feet hold.

Several hundred men resumed work at the rolling-mill of the New Jersey Steel and Iron Company, at Trenton, N. J., on the 26th. The whole number of those who have consented to go to work at the reduced wages is 700; but owing to the scarcity of helpers, they did not all resume. Six furnaces were started

The conference between the management of the Joliet Steel-Mill and the Amalgamated Association of Iron and Steel-Workers was held on the 22d, and resulted in the men accepting the proposition made by the mills, which is understood to be a reduction from last year's scale of 33⅓ per cent. The furnaces have been blown in, and the mill started with a force of 2000 men, nearly all of whom will be from among the old employés.

The stockholders of the Union Iron and Steel Company, of Chicago, have agreed to the proposition to increase the capital stock to $3,000,000, of which $1,400,000 shall be preferred. This will enable the management to resume operations.

Capitalists from New York have been at Bloomington, Ill., several days, and have selected a site for the erection of extensive iron-works.

J. L. Edwards & Co., proprietors of the rolling-mill at Canal Dover, O. have made an assignment to Charles Harger. Their liabilities are $50,000, and their assets $30,000.

The puddling-mill at Bay View, Wisconsin, which was run for three weeks, is now closed for two or three weeks until the accumulated stock of puddled iron is reduced. It is said that if the mill is kept running on half-time, it is as much as can be expected for some time to come, and there are more furnaces running in the mill than the demand for iron warrants.

An important meeting of the Western Nail Association was held at Pittsburg on the 28th. All the mills in the district were represented. After some discussion, it was decided not to suspend operations on the 7th of April, as was ordered at the last meeting, but to work two weeks longer. At the expiration of that time, a meeting will be held, at which it will be decided to continue in operation for an indefinite period. The manufacturers say that it is not their intention to increase the price of nails, but that the present rate, $3.40 per keg, must be maintained.

J. W. Mumper & Co., iron furnace and general traders, of Barre Forge, Pa., have called a meeting of their creditors to ask an extension. The liabilities are about $40,000.

The Steel Ore Company, of Pottstown, Pa., has changed the name of the furnace at Bechtelsville, which it has recently leased, to Norway Furnace.

The Roanoke, Va., *Times* states that recent developments in Roanoke County show very large and extensive deposits of a very excellent iron ore conveniently located. It rather closely estimates that pig metal can be made at the following cost:

1¼ tons of coke	$3.13
2 tons of iron ore at $1.75	3.50
1 ton of limestone	60
Labor per ton of metal	75
Interest on investment	50
Incidentals	50
Total per ton	$8.98

The ores analyze from 55 to 57½ per cent of iron, 0·40 to 0·68 phosphorus, and 3·77 to 4·21 silica.

Gunnison, Colo., has been selected as the site for the erection of iron and steel-works. The company has been organized in St. Louis some weeks, and has a capital of $5,000,000. The promoters of the scheme are B. W. Lewis and J. H. Harrison, of St. Louis, and J. M. Schoonmaker, of Pittsburg, together with the leading officers of the Union Pacific Railroad, and other wealthy capitalists of New York, Boston, Pittsburg, Philadelphia and St. Louis.

The Scranton Steel Company, of Scranton, Pa., started its new mills on the 29th. Employment will be furnished to over 1000 men. Large contracts have been booked.

The Clayton Steam Pump and Air-Compressor Works announce that they will remove May 1st, to their new works, 45 and 47 York street, Brooklyn, N. Y., near the approach of the New York and Brooklyn Bridge, where they will have enlarged accommodation and improved machinery.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY—TOMBSTONE DISTRICT.

The suit of the Knoxville against the Christmas Company has been finally decided in favor of the Knoxville.

EMERALD.—The shaft has attained a depth of 170 feet, and good ore is extracted.

GRAND CENTRAL.—The last shipment of machinery for the large pumps has arrived.

RANDOLPH.—This mine has been leased.

TOMBSTONE.—It is reported officially that the ten stamps of the Corbin mill have been running mainly on ore from the West Side mine. This mine has developed so rapidly within the past two months that it is expected that the out put in April will run the whole twenty stamps of the Corbin mill. Superintendent Church reports that one third of the Gird mill tailings-heap has been concentrated, and one half of these concentrates smelted with flux from the Lucky Cuss mine, yielding $56,000, and thus proving the Gird tailings alone good for $300,000, counting in the flux necessary to smelt them. The Corbin mill tailings-beds are larger than the Gird by at least 25 per cent. None of these has yet been concentrated.

PIMA COUNTY.

PIONEER.—The smelter has been put in practical operation with satisfactory results. Half a ton of galena ore has been run through, which yielded a bar of metal worth $150, or 93 per cent of the assay value. The Tucson *Citizen* says that the smelter is built of adobe, lined with fire-brick. It is about four feet square outside, and about twelve feet high to the top of the chimney. The blast is furnished from a huge forge-bellows propelled by hand. The smelter is an improved pattern of the Mexican smelter, with a capacity of one ton per day of ten hours. The cost was perhaps $250, which includes every expense up to the moment of starting it in operation.

PINAL COUNTY.

QUEEN CREEK.—The smelter has been purchased by J. D. Reynolds, and will be put in working order at once.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended March 17th shows: Ore crushed, 141·48 tons; average assay value of pulp, $53.66 per ton; of tailings, $6.14. East cross-cut, 1000 level, in 328 feet. The pumps are

Digitized by Google

running at about eight strokes per minute. The north drift, 800 level, is 289 feet long. In this drift, a fan is running by compressed air. South drift, 770 level, of shaft is 65 feet long. North drift, 672 level, is 28 feet long.

BODIE TUNNEL.—The ore-veins continue to look well. About 40 tons of ore a day are crushed, yielding the usual amount of bullion.

STANDARD CONSOLIDATED.—The report for the week ended March 17th shows: Ore extracted and shipped to mills, 1331 tons. West cross cut, 1000 level, in 1270 feet. South drift from east cross-cut, 700 level, in 562 feet, where the vein is about three feet wide. West cross-cut from north drift is 104 feet long, and the ground is hard to blast. North drift No. 1, 500 level, is in 565 feet, and shows the vein about five feet wide. North drift from south uprise No. 1 is 99 feet long, and the vein is 6 feet wide. South drift No. 2, 385 level, is in 364 feet, and shows the vein 6 feet wide. The slopes are looking well.

PLUMAS COUNTY—GREENVILLE DISTRICT.

GREEN MOUNTAIN.—The mills have started up again. The tunnel continues to go ahead rapidly.

TAYLOR-PLUMAS.—The mill, which started up again recently, is now supplied with ore from the winze. The manager desires to get a good milling test of the value of the ore from this part of the mine.

SAN BERNARDINO COUNTY—CALICO DISTRICT.

A correspondent of the Eureka *Sentinel* states that there are two distinct walls and well-defined ledges in the King, Moscow, and Sioux mines. The ledge in the King is about 14 feet wide, with porphyry on both sides. The greatest depth yet reached is in the King mine—150 feet. The ore is silver-bearing and soft, some free and some base. Some specimens show copper-stained quartz, carrying horn-silver, almost pure. The different mines are now developing, several mills are running, and a new ten-stamp mill is building. The trouble so far is to get water, though the wells dug on the flat seem to yield a fair supply.

CANADA.

MICHIPICOTEN.—The Michipicoten Native Copper Company held an extraordinary meeting in London recently. The company has expended £38,000 on development, buildings, and machinery, and is now unable to go on, on account of lack of funds. The company will be wound up and a new company is to be formed.

NOVA SCOTIA.

COXHEATH.—This property, which is owned and worked by a Boston company, is situated on the north side of Coxheath Mountain, near French Vale, and has an extent of 640 acres. It is developed by two shafts about 100 0 feet apart. No. 2 shaft is the main center of operations. The shaft was sunk alongside the lode at a distance of a few feet; 120 feet from the surface, the first cross-cut was started. Three feet from the shaft, the copper was struck. The cross-cut was continued in the hope of piercing a parallel lode, and is now in about 80 feet, while the copper was drifted on and a small quantity stoped out. The ore having been struck in a somewhat disadvantageous position, the shaft was opened 20 feet lower, from which point drifts have been pushed east and west nearly 80 feet in each direction on the lode, showing perfectly regular walls and ore beyond a doubt in paying quantity. The face of the eastern drift shows a piece of undisturbed ore nearly 18 inches wide, with scarcely a particle of rock visible in it. In the east drift, a winze has sunk over 30 feet deep all the way in ore; and on the west side, in addition to the drifting, the rock has been stripped off the copper more than 20 feet high, leaving a wall of ore all ready to be blasted down. Regular shipments of ore have commenced, and it is expected that from 15 to 20 tons will be raised daily. Assays made show that the ore also carries silver.

COLORADO.

CHAFFEE COUNTY.

MERRIMAC.—A strike has been made in this lode, adjoining the Black Tiger mine, of twelve inches galena and carbonates running 63 per cent lead and 36 ounces silver per ton. The Merrimac is owned by a Rushville, Ind., company, which is working a number of claims in the immediate vicinity of Buena Vista.

GREELEY.—At a distance of 223 feet in the tunnel on the Valley View No. 2, worked to open the Brighton lode, owned by this company, the miners struck a body of free-milling ore identical with the Columbus vein.

CLEAR CREEK.

MOLINE TUNNEL.—This company is still at work on the New Boston lode, running east, and has reached a distance of forty-five feet. The ore at this point holds out in quantity, and is of a better grade. Superintendent Hartzell states that they will begin to drift west next week, and start in to put up the cable tram, which is to be 2200 feet long, this being the distance from the mouth of the tunnel to the mill.

DOLORES COUNTY.

GARFIELD.—A large body of iron and lead carbonates has been struck in the mine.

FREMONT COUNTY.

ROYAL GORGE.—Work has progressed rapidly at the smelters, and the final details are now receiving attention. Power has been applied to the machinery, and it works smoothly throughout. The crushers have been started, and one of the stacks will be blown in shortly. The masonry of the second stack is completed, and the water-jacket will be in place and ready to be charged soon.

GUNNISON COUNTY.

The Elk Mountain *Pilot* says that great preparation is going on in camp for the extensive working of mines this summer. Companies are making arrangements and planning to work their properties to the best advantage, and we are looking forward to a very active season. There will be machinery put on several mines, and more systematic work is looked for.

LAKE COUNTY.

Late Leadville exchanges contain the following:

CATALPA.—All the workings of the Catalpa, from the upper shaft down, are now leased. Manager Hill is running a new drift from the bottom of the incline, a distance of about 600 feet above the upper shaft, with the expectation of cutting the ore-body developed in the Big Chief, near the Catalpa line. From the location of the body, it seems likely that it will be caught by the drift in about 100 feet.

IRON HILL.—A body of sand ore was struck in the Silver Wave shaft at a depth of 350 feet.

LITTLE PITTSBURG.—The official report shows that the ore-shipments for the week ended March 15th were 286 tons, making 564 tons for the month and 1754 tons since January 1st. A large force of men has been put to work in shafts Nos. 9 and 10 in the northern part of the property, with a view of developing that hitherto unexplored portion of the mine. The ore-body recently struck in the O. K., an adjoining mine, is looking so well that a drift from No. 10 is to be run in that direction. Two drifts are now running from No. 9 toward the Amie property.

LONG & DERBY.—A portion of the workings has been leased.

MORNING STAR.—At the mine, good progress is made at the McHarg shaft. The Waterloo incline is down about 300 feet and has something over 125 feet to go before it will reach the point where connection will be made with the McHarg shaft. It carries ore in the breast, and drifts have been run north and south in the ore. The mine keeps up its regular shipments, and the ore is of very good grade.

SILVER CORD.—According to the Ten Mile *News*, interest ceases on the Silver Cord bonds on April 1st. It is not known how many of them have been redeemed, but it is presumed that the bulk has been paid off in full. The original issue was $173,500, and they were payable in April, 1884. The company had, however, reserved the right to pay them off this year, and having the money on hand, the directors have availed themselves of the privilege.

PUEBLO COUNTY.

COLORADO SMELTING COMPANY.—Ground has been broken at Pueblo for this company's new building.

SUMMIT COUNTY.

ROBINSON CONSOLIDATED.—Reports announce that this mine has been leased to Mr. Greer, of Kokomo, of the Greer smelter, now the Greer concentrating-works.

WINTERGREEN.—This mine, said to be a promising property, situated on Jack Mountain, has been sold to Denver parties for $4750.

DAKOTA.

FATHER DE SMET.—The superintendent writes, under date of March 8th, as follows: Herewith express company's receipt for bar No. 154, 1038·25 ounces of gold, the result of run of mill for the last half of February. The mill is running well—no stoppage for any thing. At the mine, every thing is progressing as usual. We are driving four drifts, and hope to be rewarded by striking a fine body of ore in each of them. Our last month's run indicates the necessity of such a movement on our part. Report of the mine from March 8th to March 15th shows ore extracted from first, second, and third levels, 2150 tons. Ore milled, 2100 tons. North end tunnel advanced 2 feet; in 833 feet. Third level header advanced 6½ feet; in 160 feet. Golden Gate header running north advanced 13 feet. Have started a cross-cut on second level running west from Cook's chamber. Cross-cut in 11 feet.

The report of the superintendent from March 15th to March 22d shows ore extracted from first, second, and third levels, 1900 tons. Ore milled, 1900 tons. North end tunnel advanced 6 feet. Tunnel in 839 feet. Third level header advanced 5 feet. Header in 165 feet. Golden Gate header running north advanced 9 feet. West cross-cut from Cook's chamber advanced 6 feet. Total length, 17 feet.

Reports from Deadwood are as follows:

GUSTIN.—The report is again current that the owner of this mine will erect a 100-stamp mill this season. The works would have been established last year but for litigation which has happily terminated. The Gustin, although a cement mine, is considered among the best properties in the hills, having paid handsomely for the past three years, notwithstanding that its two mills are mere "rattle-boxes."

ORO FINO.—The superintendent has returned from the East. The mill is still idle, and will remain so until hoisting-works are erected and the mine opened at greater depth, all ore having been exhausted from the old workings.

SITTING BULL.—The mill is in operation, and prospects are very favorable for a longer and more remunerative run than ever before.

GEORGIA.

AURARIA.—No work is doing at this mine at present.

CHESTATEE.—Great improvements are making at the mine. The mill is running regularly.

CHICAGO & GEORGIA.—Preparations are making to move the mill down the creek, so as to get lower on the lead.

COLUMBIA.—The flume line to the mine recently purchased is under rapid headway. The company is putting the lumber for building on the ground, and finishing the grading. The tunnel on which digging is going on from both ends will be soon completed. In a week or two, the pump and boiler for throwing water on the mine will be here. A reservoir on the west side of No. 988 will soon be built, to receive the water.

HIGHTOWER.—The extraction and crushing of ore will be commenced in April.

WELLS.—The cut is opening and the mill will be started up shortly. There is good ore in sight.

MAINE.

SULLIVAN.—The secretary reports that the mill has not been running this year

MEXICO.

We have received the following from Parral, dated March 19th:

Having lately returned from Durango, where I have had ample opportunity to examine various mining properties, I propose to send you descriptions of several, so that your readers may have some notion of the opportunities in Mexico awaiting skill and capital.

CANDELARIA.—The Candelaria mine and mill are situated at Vaca Ortiz or Metales, a point on the western slope of the Sierra Madre Mountains, in the State of Durango, about 200 miles southwest by south of Parral. It contains about one thousand people, of whom nearly all the working force is employed in or about the mine or mill. The mine is on the east side of the Metales River, and the mill immediately opposite on the west side. It occurs in a mountain of the form of a sugar-loaf, which gives it facilities for economical working by means of tunnels. Of these there are three—two driven on the vein, and the third or lower a cross-cut, with some 150 feet to be driven (estimated to cost $3000) to cut the vein. The bight of this mountain is some 3600 feet above the river level. The lower tunnel now driving will cut the vein some 1500 feet below the outcrop, while, 500 feet still lower, there is another good tunnel-site; and a tunnel can be driven from the river level or 3600 feet below the outcrop. There are two principal veins, running from north to south, dipping slightly west; and these are intersected by various veins running from east to west, which, at the points of junction, form bonanzas. The workings are nearly 1200 feet deep, and at the bottom are in ore from 13 to 15 feet wide, running over 80 per cent of copper, 150 ounces of silver, and $20 gold per ton. The upper workings are in ore of lower average value—over 20 per cent of copper and 100 ounces of silver per ton. All through the mine are large bodies of rich ores running from $500 to $1500 of silver per ton, while the average vein-matter is as just stated. Last week, there arrived in Parral from this mine concentrates and ores which sold on the following assays: Concentrates, $12,331 silver per ton; copper ore, $1409 per ton. No allowance was made for the gold or copper.

On the completion to the vein of the lower tunnel, a block of vein-matter, practically virgin, will be laid open 800 × 1500 × 13 feet. When this tunnel is completed, the ores can be mined and put in mill for less than $5 per ton, while the cost of smelting them into matte will not exceed from $10 to $12 a ton, in suitable water-jacket furnaces working 40 tons each daily, making a total cost of from $15 to $17 a ton. The present cost of ores from the upper works is $25 per ton.

The mine is sufficiently open to permit a daily extraction of 100 tons of ore, as soon as the tunnel is completed and the water-jacket smelters are ready to take

Digitized by Google

care of that quantity. The present owner has spent during the last six months $42,000 in opening and clearing the mine, running the lower tunnel, and enlarging and improving the mill. This is driven by water-power, of which there is enough not only to drive a large mill, but to drive air-drills in the mine whenever compressors are supplied. The power is made available by one overshot water-wheel 34 feet in diameter; and another overshot, 36 feet diameter 6 feet breast, has been commenced. A water-jacket smelter is now in course of construction. Hitherto the method of treating the ores has been grinding, concentration, and lixiviation; but it is believed that smelting into matte and the shipment of it to Europe will be better and more economical, and will permit a larger daily output. The former owners shipped large lots of ores to Europe.

No one can tell what is in the ground unseen; but with a mine proved 1200 feet deep, and with its unequaled approaches, it is evident this will shortly be one of the famous mines of the world. GEORGE WILSON.

MARCH 19, 1883.

Marble of every color and of great extent has been discovered near Chihuahua City, and measures are taking by Americans to open the same.

MIQUETA GOLD AND COPPER MINING COMPANY.—A correspondent of the Mexican *Financier* writes as follows: The first work on the property now owned by this company was done in the winter of 1881-82. In April, 1882, the property, with all its annexes, passed into the hands of the corporation known as the Miqueta Mining Company, which was organized by and chiefly consists of Mexican gentlemen. This company owns now about one square league of mining territory and timber lands in the barrancas or cañons of Miqueta and Chonguis, in the canton of Jalacingo. The climate is as near perfection as can be had. The company is mining on four distinct lodes, the Miqueta, which is the principal one, the Prida, the Garfield, and the New Discovery. The Miqueta vein has a strike of about fifteen degrees east of north, and a dip to the east averaging eighty-five degrees. The outcrop can be traced from the bed of the river, up the side of the cañon until the crest of a dividing ridge hides it from view. A distance of 3000 feet has been well prospected and good assays of gold have been made from specimens taken along that entire distance. The country-rock through which the fissure passes is metamorphic slate (probably Azoic) at the bottom of the cañon. As you rise, these slates are covered by a stratum of gneissic rock, which in turn, and farther up the mountain, is replaced by broad outcroppings of porphyry. In this porphyry, 1000 feet above the river-bed, the developments have been made by this company. Just above the mine, and overlying the porphyry, the fissure enters a soft magnesian limestone formation, about 1000 feet thick, which forms the capping stratum of the ridge. This is metamorphosed near the top to a much harder grade of limestone and to white and blue marble. The average width of the fissure is three feet, though it sometimes shows twice that width. The vein-matter lies in laminations, the first of which, next to the east wall, is a soft auriferous sand about six inches wide, very red in appearance, sometimes highly argillaceous, and at other times composed of small quartz pebbles and sand. Assays showing 39 ounces in native gold have frequently been made from specimens taken from this part of the vein. Next to this on the west lie from four to eight inches of auriferous pyrites of copper (chalco-pyrite and bornite), which assay from 12 to 20 per cent in copper and from half an ounce to two ounces in gold. The rest of the vein next to the west wall is filled with soft talcose slate, which sometimes carries a small amount of gold, but generally too little to pay for milling. It forms the gang or wash-rock of the vein. The Miqueta vein is developed for a distance of 800 feet on the surface by a number of shafts and drifts, and to a depth of 200 feet into the mountain, and has been very constant in its supply of ores since the date of its opening. The mine is well equipped, and has a working force of from 80 to 100 men constantly employed. The other three veins worked by the company differ very little from the Miqueta in structure, except that none of them carries copper ore. The new discovery tunnel is driven 60 feet on the vein, showing a pay-streak from 10 to 16 inches wide, which gives constant assays of from two to four ounces. The Prida and Garfield lodes carry gold and iron in paying quantities, and have tunnels driven on each of them to a depth of 140 feet, both on good ores. The company has been the first, at least in this part of the country, to introduce a complete system of American mining. It has a first-class ten-stamp American mill brought from the United States. This company has now in construction a self-acting wire-rope tramway, to carry the ores from the mine lying a thousand feet up the mountain down to the mill. It will be 2138 feet long, from top to foot, and the loaded car in descending will raise the empty car to the mine.

MONTANA.

ALICE.—It is stated that the old twenty-stamp mill, which has been running on base ore, will shortly be fired up on free-milling rock from the new strike on the foot-wall of the vein on the 100-foot level. The new strike has been exposed for a total length of 150 feet, for which entire distance the average width of the ore-body is about four feet. It pulps $50 in the mill.

ANACONDA.—This copper mine is also a producer of silver ore, and has for the past eight months regularly supplied the fifteen-stamp Dexter mill with free-milling ore. This supply is taken principally from the 100 and 200-foot levels, below which the ore carries an increasing percentage of copper until, on the 4th, 5th, and 6th levels, the ore is almost exclusively copper-bearing for the full width of the ledge. The amount of ore worked daily is about 27 tons, which is crushed wet. The assay-value of the ore, which is free, averages about $30, though above the copper levels there are thousands of tons of high-grade silver-copper ore which is rich enough to ship, but which can not be worked by the free-milling process.

MOULTON.—The new ore-body was discovered on the south vein, at a point about midway between the end-lines of the claim and 580 feet west of the main shaft. The shaft is 20 feet deep, and the vein is from four to six feet wide, most of it pay-ore. Ten tons of ore, which mills about $100 a ton, are extracted daily. The strike is increasing in width, and the bottom of the shaft is all in ore. In the main workings, operations are progressing as usual, and the production of 40 tons of ore a day is regularly maintained. On the 200 and 300-foot levels, the stopes are looking well, and on the latter it is believed the same chute of ore is worked as the one recently struck on the surface in the south vein. In this event, a fine body of ore will soon be available for stoping from the 300-foot level to the surface.

PARROT.—The output of this mine is at present 125 tons per day. At the smelter, five reverberatory furnaces are constantly in operation in preparing the ore for reduction into matte. The concentrator, which has a capacity of 50 tons, is continuously employed, and it is safe to say that the works reduce an average of fully 100 tons of ore a day, in addition to which regular shipments of crude ore are made. From four to six car-loads of ore and matte is the amount daily shipped East by the company, and the fact that the producers of the copper are also the consumers of it gives them a great advantage over other producers. A report is in circulation that, on the return of Mr. Farrell, extensive copper refining-works will be erected, which would prove of immense benefit to the copper interests of this district.

SILVER BOW.—Operations at the different mines continue. The mill is making a successful and continuous run on good ore, of which it reduces 30 tons every twenty-four hours. The percentage of chlorination and amalgamation is said to be uniformly high.

NEVADA.

ALBION.—At a meeting of the directors and creditors, an arrangement was made whereby Messrs. Robinson, Gurnee, Bell, Pichoir, and Smith resigned, and the following gentlemen were elected to fill the vacancies: Charles H. Fish, Henry T. Scott, F. A. Wagner, A. J. Ralston, and Samuel Hart, who, with Mr. S. Heydenfeldt and Julius Jacobs, form the new Board of Directors. Mr. Charles H. Fish was elected President, and Mr. A. W. Havens Secretary, to take effect April 1st.

CHOLLAR.—At the annual meeting the following board of directors was elected: A. K. P. Harmon (President), C. L. Weller (Vice-President), J. D. Fry, William Norris, and J. H. Dobinson. W. E. Dean was re-elected Secretary, and I. L. Requa Superintendent. The superintendent's report shows that the work done on the 2400 level proves that precious metal does not exist there. On the 2600 level, at a point 410 feet west from the shaft, the lode was intersected. The ledge at this point is nearly 100 feet in width, well defined, with a two-foot clay wall on east and a clay duke on west. The largest sum obtained from assays was $1.90. A drift started north 100 feet in the vein produced no assays of value. At a point 362 feet west from the shaft, a tunnel was run, which was carried to the north line of the Potosi. No cross-cutting or prospecting has been done from this drift, but will be when the Potosi Company completes its drift to its south line. Wherever the main adit comes in contact with the vein, clay and quartz not unpromising in appearance were abundant.

HALE & NORCROSS.—The first official letter of Superintendent Keating states that he has examined the mine and its properties and found them in a satisfactory condition. In that part of the mine on the 2600 level of the joint Savage and Norcross drift, samples have been taken from the quartz stringers previously passed through the north lateral joint Savage drift, and the result shows sample No. 1 to contain gold, $10.55; silver, $58.44. No. 2, gold, $18.08; silver, $72.59. No. 3, gold, $9.04; silver, $30.16. No. 4, gold, $3; silver, $14.14. No. 5, gold, $2.25; silver, $7.54. No. 6, gold, $1.50; silver, $6.59. No. 7, gold, $7.54; silver, $35.82. No. 8, gold, $3; silver, $11.31.

NEW MEXICO.

HACKBERRY.—The superintendent states that he has ten cars of material coming from the East, and that as soon as they arrive, the mining and milling company will begin work.

HARD SCRABBLE.—The developments consist of a tunnel 195 feet in length, cutting the vein diagonally at about seventy feet from its mouth. After passing through the vein a short distance, the tunnel makes a turn, and is now continued to enter the vein again from the east side. At the point where the tunnel cross-cuts the vein, it shows a width of sixty-two feet. The first level, twenty feet above the tunnel, also cross-cuts the vein from wall to wall, showing a width of about sixty feet. Forty feet higher is another level, 160 feet in length, and from which the ore is stoped to the limestone cap-rock previously referred to, and which is just above this level. The last-mentioned level is connected with the surface by an air-shaft. These developments open an ore-chimney about sixty feet in breadth and nearly 100 feet long, inclining 80 degrees to the northeast. The ore taken from this portion of the mine is a quartz and siliceous sand carrying on an average about six per cent lead and twenty-five ounces in silver to the ton, with very little iron. In addition to the above developments, are a number of open cuts and shallow shafts, sunk on both sides of the limestone cap, and next to the wall-rock. All of these openings show good ore. About 300 tons of ore have been shipped this year, averaging twenty-five ounces of silver to the ton. The bulk of the ore was sent to the Magdalena smelter.

MAGDALENA.—The smelting-works were recently blown in again. The works consist of a single water-jacket blast-furnace, of medium size, good engine, boilers, blower, pumps, and ore-crusher. The ore reduced at the smelter is principally from the Juanita, Hardscrabble, and Graphic mines. The manager is endeavoring to make other contracts, and, if successful, will add another furnace to the plant, and make preparations to do a large smelting business. In addition to the smelting-works, the company owns about fifteen mines and prospects, mostly prospect properties, however. The most valuable property is the Iron Mask lode, located near the smelter. It had been worked regularly until a few days ago, when the water drove the miners from the workings. The ore from the Iron Mask is principally copper and silver, very rich, but also pockety. Arrangements have been made, and within a short time pumping and hoisting machinery will be placed on the shaft, and work resumed.

PENNSYLVANIA.

The engine-house of the Monocacy Iron Company at the ore mines in West Pikeland, Chester County, which was burned a few days ago, has been rebuilt, and operations are about to be resumed.

A rich deposit of hematite ore has been discovered on the farm of John Hill, two and a half miles from Reading, and arrangements have been made to work the mine on an extensive scale. The ore lies close to the surface, and the deposit has been penetrated to the depth of thirty-three feet.

UTAH.

According to the Salt Lake *Tribune*, the Mountain Chief property, located near the Ontario at Park City, is involved in a contest in the courts for the purpose of determining title. The claim lies just north of the Ontario ledge, and so close to the new hoisting-works of that company that the carpenter-shop is said to have been erected on it, and the dump there also covers a portion of the ground. It is stated that notice has been given to the Ontario people that they must not occupy or injure the property by depositing *débris* on it, and that they must cease to trespass on the property.

A correspondent of the Salt Lake *Tribune*, in speaking of the condition of the mining districts in Beaver County, says of the Star District that a good body of ore has been struck in the Kanarrah mine, in South Camp, at a depth of 250 feet. The ore-body is large and continuous.

Work continues on the Mammoth and St. Mary mines with good results; in fact, all the mining claims that have been worked upon the past winter are looking better than ever before, and greater depth is attained, which proves that the ore-bodies lie deep. Some of the claims have reached a depth of 300 feet, with ore in the bottom. This district is not troubled with water, as the mines so far are dry, and are likely to remain so for 1000 feet at least.

At North Camp, work has been started upon the Osceola, and some good ore has been taken out. Also on the Dykes and Morehouse mines.

The Lake Superior mine is now worked, and a large body of copper ore, containing gold and silver, is opening up.

In the Bradshaw District, the Cave mine has stopped the shipment of ores to Frisco. Rumor has it the company contemplates the reduction of its own ore at Milford, which is sixteen miles nearer the mine, at an early date.

The Horn-Silver works should have been built at Milford or some point in the valley, as the situation and facilities are here for them. Work in the Horn-Silver has been resumed. The cave was expected and prepared for some time ago, but they did not expect it to go so deep as it is now. It will be all the safer to work in the future. By the cave they have saved great expense in timbering, and it was most all ore that came down.

The O. K. copper mine, in Beaver Lake District, is looking well, and a whim is constructing.

Lincoln District is looking up again. The Frisco Mining and Smelting Company has become interested in it of late.

Work still progresses on the Lone Brother and other claims, with favorable results.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, March 30.

There is no change of interest to note in the mining market this week compared with last. Business has been quiet, and the dealings were confined generally to the low-priced fancies. The tone of the market throughout has been one of depression, and closed to-night dull and weak. Below will be found a complete summary. The total number of mining shares sold at all the Exchanges aggregates 346,695, as against 323,960 last week.

The Comstock shares have been generally quiet and weak. California sold, assessment paid, at 25c., and assessment unpaid at 5@3c. Consolidated Virginia was quiet and irregular, selling from 47@50@46@48c. Sierra Nevada records one small transaction at $2.15. Union Consolidated was quiet and weak, declining from $4.75@$3.50. Ophir records a small business at steady prices: it sold from $2.88 @$3. Yellow Jacket was quiet and a little weak, selling from $3.@$2.50@$2.63. Best & Belcher sold at $3.75 with one transaction. Sutro Tunnel was quiet and steady, the sales aggregating 8600 shares at 20 @19c.

The Leadville stocks were quiet and steady. Amie Consolidated records a large business at steady prices, selling at 24@25c. Chrysolite has been weak, under a small business, selling from $1.30@$1.20. Dunkin was quiet and weak at 30@20c. Hibernia sold at 4c., the transactions being small. Iron Silver was quiet and steady, selling from $2.80@$2.90. Leadville was also quiet and steady, selling from 73@70c. Little Chief sold from 41@40c., with transactions of 5100 shares. Little Pittsburg was dealt in to the extent of 600 shares, at 66@62c. Big Pittsburg was quiet and a little weak; it sold from 17@13c. Climax records a small business at steady prices, selling from 8@10@9c.

The Bodie stocks were quiet and record steady prices. Bodie sold from 90@85c. with a business of 770 shares. Standard had a small business at steady prices; it sold from $6.25@$6.50. Bulwer was quiet and irregular, selling from 85@90@85c. Goodshaw sold at 5c., with a small business.

The Tuscarora stocks record but a moderate business, and have been weak. Grand Prize was irregular at 55@60@57c., the transactions amounting to 500 shares. Argenta sold at 55c. Belle Isle had a small business at very irregular prices; it sold from 62@90c., then declined to 50c. Navajo was quiet and weak, selling from $4.15@$2.75. North Belle Isle was weak at 55@50c., with a business of 1100 shares. Independence had a moderate business, but was weak; it sold from 80@70c. Elko Consolidated was active and very irregular, selling from 12@18@13c.

In the miscellaneous list, Alice was quiet and a little weak, selling from $2.95@$2.85. Eureka Consolidated records a small business at declining prices; it sold from $6.25@$5.50. The Green Mountain stocks were quiet and steady. Gold Stripe sold from 8@7c. Green Mountain sold from 75@78c. Rising Sun sold at 5c., and Cherokee at 3@4c. Homestake has been moderately dealt in, but at irregular prices; it sold from $15½@$15¾ @$15¼@$15½. Horn-Silver was quiet and steady, selling from $7.75@$7.88. Robinson Consolidated has been very active and very irregular; it sold from 72@79@70c., closing to-day at 75c. Sierra Grande sold ex dividend this week, but has been about steady; the sales aggregate 31,000 shares, selling at $2.10@$1.75@$1.85.

Alta-Montana has been quiet and steady at 8@9c. Central Arizona records a small business at irregular prices, selling from 25@34@38c. Decatur has been quite active and steady, selling at 7@6c. Eastern Oregon was strong under a small business, and sold from 60@70c. Harlem M. and M. was fairly dealt in, and was very irregular, selling from $1.40 up to $1.55, and then declining to $1.40, closing at $1.50, buyer thirty days. Lacrosse had a fair business at about steady prices, selling from 17@14c. Oriental & Miller was active and steady, selling from 18@16c. Rappahannock sold at 9c., with a small business. Sonora Consolidated was very active and very irregular; it sold from 40@55@47@49c., with a business of 37,600 shares. South Pacific was active and steady, selling at 8@7c. The State Line stocks were quiet and steady; Nos. 1 & 4 sold from 2@3c., and Nos. 2 & 3 at 6c. Taylor-Plumas was active and steady at 17@18c.

A majority of the directors of the Climax Mining Company applied to Judge Donohue on Thursday for an order to dissolve the company. The company was organized in 1879, with a capital of $2,000,000. Its mines are situated at Leadville, Colo. The reason given for the application is, that the mines are exhausted, and that the company is in debt to the extent of $16,198.44. Its assets are five and a half acres of land at Leadville and the machinery for working the mines. Judge Donohue granted an order requiring all persons interested in the company to show cause on August 17th next why the petition should not be granted and the company dissolved.

The Tombstone Mill and Mining Company has paid another installment this month of $25,000 on its old debt, being profit derived from the Corbin mill.

The conference committee of the New York Mining Stock Exchange and the National Petroleum Exchange has arrived at a basis of consolidation, and the Governing Committee of the former body has requested a written opinion from members in regard to it, by April 3d. The conditions, as agreed upon, for the proposed union, are as follows: Members of the Petroleum Exchange to become members of the Mining Exchange on paying $100 each and also a sum equal to the net reserve of the Gratuity Fund of the Mining Board on the basis of present membership. This would be about $23 apiece. The Governing Committee of the Mining Exchange is to be increased from twenty-seven to twenty-nine members, the additional places to be filled from the incoming members of the Petroleum Exchange. It is also provided that the surplus now in the treasury of the Mining Exchange in excess of $100 apiece (about $40) is to be credited to the present members and applied in payment of future dues or other indebtedness by them to the Exchange.

The threatened suit, noted in our last issue, by some the members of the American Mining Stock Exchange against the Mutual Trust Company, was begun on Monday last by William T. Brown. In Mr. Brown's complaint, he demands that the defendant Trust Company shall account to him for all moneys paid to the Trust Company for memberships in the Exchange; and that if it shall appear that they have been squandered, he may be given leave to bring in the officers of the company as co-defendants; that the defendant company be removed as trustee and enjoined from expending any of the funds remaining in its hands, except under the orders of the court; and that a receiver of the trust funds may be appointed. The summons and complaint were served upon the officers of the Trust Company, and they have twenty days in which to file an answer.

MEETINGS.

Copper Queen Mining Company, Nos. 37 and 39 Wall street, New York City. Annual meeting of stockholders and election of trustees April 9th, between twelve and one o'clock P.M.

Minas Nuevas Mining Company, Nos. 46 and 48 Exchange Place, New York City. Annual meeting of stockholders and election of trustees April 3d, at eleven o'clock A.M.

DIVIDENDS.

The Bulwer Consolidated Mining Company, of California, has declared dividend No. 17, of five cents per share, payable April 12th, at the Farmers' Loan and Trust Company.

The Copper Queen Mining Company, of Arizona, has declared a quarterly dividend of fifty cents per share, payable April 16th. Transfer-books close April 13th, and reopen April 17th.

The Gem Mining Company, of Colorado, has declared a dividend of two per cent on the capital stock, payable April 2d, to shareholders of record March 29th.

The Glen Mining Company, of Colorado, has declared a dividend of one per cent on the capital stock, payable April 2d, to shareholders of record March 20th.

The Granite Silver Mining Company, of Colorado, has declared a dividend of one per cent on its capital stock, payable April 2d, to shareholders of record March 29th.

The Hope Mining Company, of Montana, has declared a quarterly dividend of $1.50 per share, payable to stockholders of record March 26th, at the office of the company, 417 Olive street. St. Louis, Mo.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, No. 55 Broadway, report as follows for the week ended Friday, March 30th, half-past one P.M.:

On Thursday night, the 22d, the Anchor wells Nos. 14 and 16 came in, and on Friday (which was a holiday) the Murphy well, near Balltown, was reported flowing. The result of these facts transpiring during the adjournment from Thursday till Saturday morning was, that at the opening Saturday oil sold at $1, as against the closing of $1.03 Thursday night. By Monday noon, the decline reached 92⅝c. as the lowest quotation, from which it recovered before night to 95⅛c.

There was no special feature to the market tween Monday evening and noon of Thursday waiting condition prevailed during this interval, but at two o'clock Thursday P.M., there was a sharp upward turn from 95½c.@$1.00¼, with a decline 98⅛c. at the close. This was due to a rumor that the Murphy well was a "duster," that is, was dry. This not proving to be true, the market this (Friday) morning opened off 2 cents from last night's closing at 96c., sold down to 94⅛c., recovering to 97¾c., at this writing, two P.M., being 96c.

The "short" interest in Oil City and Bradford is so heavy that carrying charges hardly equal the actual storage, and it is probable that the importance of the new wells has been fully discounted, and that, as soon as the actual status of the Murphy well is ascertained, oil will sell over the dollar mark.

The significance given to the Murphy well is due to the fact that it is outside the present known limits of the Cooper pool, and the "bears" assert that it opens up a new field, though the "bulls" assert that it is too small a field to affect production.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
March 24	$1.00⅛	$1.00⅛	$0.97½	$0.97⅝	619,000
26	.98⅜	.98⅜	.93⅝	.95¼	1,044,000
27	.94⅛	.95⅛	.93⅝	.95	735,000
28	.95¼	.97⅝	.94⅝	.95⅛	836,000

REVIEW OF THE SAN FRANCISCO MARKET.

Business has been rather quiet in the San Francisco market. The Comstock shares have been weak, and show a decline in all the more prominent ones. The

Digitized by Google

Sierra Nevada Company has levied an assessment of one dollar per share. The Tuscarora stocks remain quiet and firm. There are good reports from the mines.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, March 29.

There is absolutely no feature to the market for mining stocks to be reported this week. The transactions recorded are very light, and although prices are tolerably well sustained, the lack of orders and the entire absence of any speculative element serve to render the market dull and featureless. Calumet & Hecla is firm, and actually shows an advance of $2 per share over last week, although less than ten shares sold at $242, which was the bidding price to-day at the close. Holders of this stock are well contented with the return for their investment, and seem to be indisposed to part with their shares at this price, notwithstanding the outlook for the coming year is not so favorable as could be desired. Franklin, steady at $12 on small sales. Quincy, in fair demand at $49@$49½, with but little stock offering. Osceola declined from $29½@$29, and was offered at that price at the close. Atlantic declined from $13 (March 10th) to $10, but subsequently rallied and sold at $11, which is now bid. National sold at $1⅛. Allouez sold at $2@$1¾.

In silver stocks, Bonanza Development declined from $2½@$2; over 2000 shares sold at the latter price to-day, which was also the closing bid. Catalpa was steady at 45@47½c.; Crescent, at 22½c. San Pedro declined from 55@45c., with later sales at 50c., closing 50c. bid. Harshaw sold at 75c.

At the Boston Mining Exchange, business continues to rule dull, without any feature of interest. Massachusetts & New Mexico shows a further decline from 10@8c. Empire declined to 18c., and the tendency of the stocks dealt in at this Board is to lower prices.

3 P.M.—There was no change to note in the market this afternoon. Bonanza sold at $2; Catalpa, 45c.; San Pedro, at 55c. Closing prices: Allouez, $2¼ asked. Atlantic, $10½ bid. Antimony, $14 bid, $15 asked. Calumet & Hecla, $242 bid. Huron, 50c. bid, $1 asked. Franklin, $11 bid, $11½ asked. National, $1 bid, $1⅛ asked. Osceola, $29 bid, $29½ asked. Pewabic, $4 bid, $5¾ asked. Quincy, $49¾ bid, $50 asked. Sullivan, 50c. bid, $1 asked. Since the Board, sales of Osceola reported at $29.

BULLION MARKET.

NEW YORK, Friday Evening, March 30.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended March 30th, as compiled from various sources, amounted to $146,644.34, as against $184,834.47 reported for the previous week. The receipts from January 1st, 1883, to date are $3,582,208.08.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended March 24th	$378,570

Since January 1st, 1883	4,152,669
Corresponding period last year	941,579

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 3 per cent, and the outside rate for bankers' bills is the same. During the week, the bank lost £302,000 bullion, and the proportion of its reserve to its liabilities was reduced from 40 11/16 to 38¼ per cent, against 42¾ per cent at the same date last year. The weekly statement of the Bank of France shows a gain of 1,650,000 francs in gold and a loss of 9,525,000 francs in silver.

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.11 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 14⅛ per cent, to arrive at actual value.

MINES.	States.		Month of February.	Year from Jan. 1st, 1883.

METALS.

NEW YORK, Friday Evening, March 30.

Copper.—The market has been weak, Lake copper having sold as low as 17⅛c., and being now offered at 17@17⅛c., with little disposition manifested to buy. The feature of interest during the week has been the declining on the part of the lake companies of an additional block of 3000 tons of copper for export at a price rumored to be 15⅝c. The reason for this refusal is stated to be that the lake companies do not see their way clear to supplying the home demand. It is believed that negotiations are now pending with manufacturers for contracts for delivery.

Manufacturers do not speak in a sanguine tone of the future, and, making due allowance for the natural bear feeling on their part, it does seem that business is not very brisk with them. The constant decline in raw material may, however, have had the effect of inducing buyers of manufactured goods to hold off. The lesser producers must feel the competition of other brands, some of which are pushed with exceptional facilities and by strong parties. We understand that at a recent meeting of brass manufacturers a considerable quantity of "Anchor" and "Star" brands of copper were taken; in fact, it appears that the Waterbury manufacturers are pretty well supplied for many purposes. Nominally these brands are held at 16¾@16½c. respectively; but there are reasons to believe that these prices are shaded one quarter of one cent per pound for any thing but jobbing lots. Baltimore is quoted 15¼c., and other brands 15⅛c. It must not be forgotten that these figures are very near the parity of Best Selected in England, with which they favorably compare. There is, therefore, only a small margin for a further decline, provided the English market s held. London cables £65 10s.@£65 15s. for Chili Bars, and £72 5s.@£72 10s. for Best Selected.

Lead.—By a sudden bear movement on the part of one of the principal holders of lead, sales aggregating probably from 900 to 1000 tons of lead, in large and small lots, have changed hands at 4·50c., and a sale is reported from Boston of lead by a Chicago firm at 4·50c. delivered, equal to 4·45c. bid. There are rumors that negotiations are going on for the sale of the large block of Richmond lead here and to arrive. As yet, nothing has been settled, however. Refined is entirely nominal at 4·55@4·60c.

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day:

Our market has declined slowly since our last report. Sales yesterday were 400 tons of Refined at 4·12½c., and to-day 80 tons of Chemical Lead at the same price.

Tin.—Our market has been quiet, though a better feeling prevails. The Banca sale went off at a parity of £96 10s., which is also the latest London cable. At the close, the market is 21⅝c., spot Straits; 22c. Australian; 21½c. Billiton; and 22c. Banca.

Spelter.—The market is quiet, with Domestic at 4·75@4·85c. England cables £15 15s.@£16.

Antimony.—We hear of no business, and repeat our quotations, 11c. for Cookson's and 10c. for Hallett's, in jobbing lots.

IRON MARKET REVIEW.

NEW YORK, Thursday Evening, March 30.

American Pig.—What little business in the way of contracting for the season's delivery did exist has now entirely ceased, to judge from the apathy of buyers. The Thomas, Allentown, and Crane companies are still maintaining the prices fixed, but are not doing any thing, while other less known brands must force sales by concessions of from 50 cents to $1 per ton. We quote $22.50@$24.50 for ordinary to choice Foundry No. 1; $21.50@$22.50 for No. 2; and $19@$20.50 for Gray Forge. In Bessemer Pig, we note the sale of a few thousand tons at Lebanon for $18, $19, and $20, for Nos. 3, 2, and 1, respectively, the bulk being Nos. 2 and 3. Spiegel is quiet at $26 for 10 to 12 per cent, and $32 for 20 per cent.

Scotch Pig.—Very little has been done, but as yet the absence of transactions has not materially weakened prices, which will not take place until the arrivals begin to go into store. Freights are still 5 shillings from Glasgow to New York. We quote Coltness and Langloan, $24.25@$24.50; Summerlee, $24@24.50; and Eglinton, $21@$21.50. At the Wall Street Exchange, the following cable quotations were received to-day, showing a slight decline in some bonds: Carnbroe, 55s. 3d.; Gartsherrie, 61s. 9d.; Summerlee, 61s. 6d.; Coltness, 64s.; Langloan, 64s. 6d.; Glengarnock, 55s.; and Eglinton, 49s. 3d.; Warrants are 47s.

Rails.—We hear of no business of magnitude, although the inquiry for small lots for spring and

summer delivery continues fair at the ruling quotations for small lots, $39 at mill, ordinary sections.

Old Rails.—Very little has been done. For Ts, immediate delivery, $23.50 is offered and $24 bid.

Scrap.—Scrap is quiet, with quotations unchanged at $25, ex ship.

Philadelphia. March 30.

Pig-Iron.—Makers are still complaining of low prices and dull demand for ordinary brands. Makers of special brands report an improving activity, though they are not satisfied with the prices obtained. Foundries run from $22@$25.50, according to number and brand, and Forge from $18@$21 at furnace. The most activity took place in the higher grades of both. The ordinary and low grades are more or less neglected. Inquiry has been quiet. Actual transactions since Monday are up to the average, and the indications point to an increasing consumption. Buyers have more evidences now than heretofore that prices have reached bottom limits, and the fact that some furnaces have gone out of blast and that others are likely to do so, will, as far as it goes, tend to stimulate prices and induce consumers to cover requirements. Average prices for Forge are $20.50 delivered; No. 2, $22.50; No. 1, $25; though there are a great many sales above and below these figures. Bessemer is without change. Scotch in the lower grades is active; in the higher grades, dull. Stocks are trifling, and inquiries are not numerous.

Merchant Iron.—Ordinary iron in country mills has been sold at 2@2·15c. according to size of order, and a good deal of business is reported, though only or from thirty to sixty days' requirements. The local manufacturers report an improving demand, though, as heretofore, orders are mostly small. Offers have been made for large lots at lower figures than manufacturers will accept. Skelp Iron is in fairly active demand. Wrought Pipes 67½@70 off. Boiler Tubes are quoted 55 off. There are inquiries in hand for large lots.

Sheet-Iron.—The leading makers of sheet-iron report a little more inquiry for future requirements; but buyer are unwilling to pay current rates, and hence business is confined chiefly to small lots. For numbers 16 to 28 in small lots, prices are 4@4½c. Thin sheets are in special demand. Some orders for Galvanized have been placed at about 35 per cent off list. The outlook for the sheet-iron interest is favorable, in view of the large building operations at hand.

Structural Shapes.—A larger amount of business was transacted this week than last. Quotations are unchanged. Angles are quoted at 2·40@2·50c.; Tees, 3·20c.; Beams and Channels, 3·40c.@3·50c. Some large business is in sight. Bridge iron is under fair inquiry.

Plate and Tank Iron.—Larger orders were placed this week than usual, but selling prices are low. Competition is active because of the scarcity of work; though at the rate business is accumulating, prices will harden in a few days. Common Plate is quoted at 2½c., though sold at a little less; Shell, 3½c.; and Flange, 4½c.

Steel Rails.—The railroad builders are moving more slowly than a year ago, and most of the business transacted is of a retail character. Negotiations for large lots are going on. Quotations are given at $39; how much less would be accepted can not be ascertained in advance.

Old Rails are almost without sale. Sellers are asking $24. There are offers from New York at considerably below these figures.

Scrap.—A number of small transactions in Scrap were closed this week at $25@$26 for No. 2, with about a dollar more for selected No. 1.

Cleveland. March 28.

The market continues in its improvement, and we think that without doubt the bottom has been reached, and for many sections, it is on the rebound.

Consumers have more confidence, and place orders for round lots, and, where possible, for delivery from two to three months; but furnaces are not at all anxious to sell for future delivery at present prices, and there is a more decided "sit down and wait" feeling among them that can not fail to be beneficial.

Stocks of good Foundry Irons are very small, and find ready sale.

There is very little doing as yet in the ore trade. We quote:

No. 1 Bessemer	$23.50@$24.00
" Foundry, all ore	22.50@ 23.50
" Foundry, cinder mixture	22.00@ 23.00
" Soft Foundry	21.50@ 23.00
" Open silvery	21.50@ 22.00
Mill Irons	19.50@ 22.00

Strictly Cold-Blast Charcoal	28.50@ 31.00
Four months, f. o. b. cars Cleveland:	
Bessemer ores	8.50@ 10.00
Hematite "	6.00@ 8.00

COAL TRADE REVIEW.

New York, Friday Evening, March 30.

Anthracite.

The coal companies report a fair business at prices closely approaching the circular rates; but there is apparently a considerable quantity of coal in the market at figures somewhat lower than those established by the companies. Buyers have not abandoned their policy of reserve; but there seems little prospect that their expectations will be realized. The only weak spot is Boston and the East, which seems to have become the market in which inconvenient excesses of supplies are pushed off. The coal companies have reached the tacit understanding that the following will be the idle days for the next four months: April 5th, 6th, 7th, 12th, 13th, and 14th; May 3d, 4th, 5th, 10th, 11th, and 12th; June 7th, 8th, 9th, 28th, 29th, and 30th; and July 5th, 6th, 7th, 12th, 13th, and 14th. This, of course, is subject to modification, should the demand prove in excess of the supply. It proves that the companies are in earnest about keeping out any surplus of coal, and that buyers must not expect any extraordinary concessions.

The Western shippers of anthracite coal had a somewhat stormy meeting in this city this week, and at one time during the proceedings there threatened to be a serious disagreement among them. The issue discussed was whether the carrying companies should be the ones to fix prices exclusively or not. An arrangement was effected, and a circular will be issued by the Secretary, Mr. John H. Jones, tomorrow.

From Philadelphia, under date of March 20th, a well-informed correspondent sends us the following:

Prices have been fixed for city and line for April at a decline of 10 cents per ton for egg, chestnut, and pea, other sizes remaining the same. This is an average advance of about 15 cents on opening rates last spring. The tolls from last Monday are the same as the opening rates last spring. At tide-water, the prices for shipment are also about 15 cents higher for stove, and materially the same for the rest

The local trade is healthy. The long winter has made the consumption steadily good, and the dealers have no stock. Buyers East seem to think the prices are higher than they should be on stove, but that size is not accumulating, and, no doubt, they will soon find that present rates are likely to be maintained. In Boston, a few dealers are selling at retail without any profit, and make the buyers delay purchases. Some of them get coal put on their carts cheaper than they can buy the cargo, a condition of things which can not last.

Freights are unusually low for this season of the year: $1.25 to Portland, $1.30@$1.35 to Boston, and equally low to Southern ports; 65@70c. to Richmond and 55c. to Norfolk.

Bituminous.

Business drags along without any features of interest. It is suspected that the low prices now heard of must in part be due to deliveries of coal to others than those with whom contracts were made, with the result of securing freight rates lower than the established schedules. These contracts, however, expire during the coming month, so that, if this be the cause, it is temporary only. Quotations are nominally unchanged, though it is likely that they are considerably shaded.

STATISTICS OF COAL PRODUCTION.

Belvidere-Delaware Railroad Report for the week ended March 24th:

	Week.	Year. 1883.	Year. 1882.
Coal for shipment at Coal Port (Trenton)	2,147	4,359	.....
Coal for shipment at South Amboy	21,156	172,404	152,221

Mr. J. TROWBRIDGE BAILEY has left for the West on an extensive trip. Communications for him should be addressed to Idaho Springs, Colo.

IT seems, from statements that appear worthy of belief, that there is a movement among Western manufacturers of iron to provide for a scaling down of the prices paid to labor. It is well known that the relations between the finishers and the puddlers in the mills are by no means harmonious, and it is possible that a brief struggle only will decide the question of wages when brought up.

IN response to the wishes of a large number of persons, the body of PETER COOPER will be placed in All Souls' Church, corner of Fourth avenue and Twentieth street, this morning, at nine o'clock. The funeral services will take place at three o'clock in the afternoon. Seats will be reserved for the family, and the pews on the middle aisle will be kept for such committees and public bodies as have expressed a desire to be present. The remainder of the church will be open to the public.

As we go to press, we are in receipt of the annual report of the Horn-Silver Mining Company, the largest single lead-producer in this country. We shall deal with it in detail next week, and need only state now that it shows that the company had a prosperous year, having produced 44,782 tons of ore, running 37·8 per cent of lead and 34·2 ounces of silver. The receipts, notwithstanding the decline both in silver and in lead, were $3,385,811.68, while the cost of mining, smelting, and refining was $1,800,230.92. The cost of mining has been carried down from $5.15 to $4.44, that of smelting from $16.67 to $14.78 per ton of ore at the Francklyn smelter, and the cost of refining at Chicago from $11.03 to $9.05 per ton.

THE Lake Superior mines have taken a sudden turn in their policy, and are now freely offering copper at 16 cents, at which figure sales of some magnitude have been made. Other brands are correspondingly depressed, and range between 15 and 15½ cents. It is too early now to discuss the bearings of this change of policy, which was probably precipitated by the inroads which Western copper made upon the markets of Lake. While the present range of low prices continues—and it will probably last some time, before production and consumption are readjusted—it is likely that the bulk of argentiferous mattes, notably those of Montana, will seek a market abroad.

In the light of the decline in the value of the metal, it may be of interest to glance at the figures at which some of the more prominent Lake Superior companies can produce copper. The Quincy, the largest on the lake after the Calumet & Hecla, produced in 1882 5,682,663 pounds of ingot, at an expenditure of $477,980, exclusive of construction, or 8·4 cents per pound, working rock containing 3·21 pounds of ingot: including $52,000 for construction, the cost will be 9·5 cents. The Calumet & Hecla works are ranging from 5 to 6 per cent, and, exclusive of an enormous sum paid out for new machinery, gave its shareholders a profit of $2,000,000 on a product of approximately 32 million pounds of copper. It is not probable that the bare cost of producing and marketing its copper costs this great mine more than from 7½ to 8 cents, if it is not less. With its new appliances, the mine will have little trouble to make up for its falling off in revenues, by reason of a lower price realized, by an increase in the quantity produced. Among the other mines, the Osceola, with a product of about 4,250,000 pounds of ingot, paid dividends footing up to $250,000 for the fiscal year, or approximately 6 cents per pound, leaving the cost between 11 and 12 cents. The Franklin, following next with a yield of 3,264,120 pounds of ingot, worked rock containing 22 pounds of ingot per ton at a cost of 10·7 cents for mining, crushing, and washing. Adding cost of smelting, freight, marketing, and general expenses, brings the cost up to about 13 cents. The Atlantic turned out 2,631,708 pounds from rock carrying only 0·693 per cent of copper, at a total cost of $1·9082, or 13·8 cents per pound. The Allouez, hampered as it was by the absence of a good stamp-mill, produced 1,683,557 pounds of ingot from very poor rock, running 17·31 pounds per ton, at a cost for mining and crushing of $2.60 per ton, or 15·04 cents per pound, to which added the smelting, freight, and other expenses, carries the cost to 17·38 cents per pound. The Pewabic is probably the weakest of the larger producers. It turned out 1,482,664 pounds for 1882. The rock was poor, running 20 pounds of copper per ton, while the cost of treatment was $3.03, or 15·1 cents per pound. Adding about 2 cents per pound for smelting, freight, marketing, etc., would make the cost, delivered, fully 17 cents. We have no data as yet relating to the Central, while the figures for the Huron and Ridge are given elsewhere.

From this *résumé* of the cost of production of the Lake Superior copper mines, it will be seen that all the important producers, with the exception of the Pewabic, will not be threatened with ruin by a price approximating 16 cents only. As they represent a product of fully fifty millions of pounds of copper out of a probable yield of fifty-seven or fifty-eight millions, it will be seen that there is no prospect of any serious check in the output of the Lake Superior mines. In fact, it is possible that there will be a further increase, however much the dividends may shrink. How many of the Western mines will fare, with prices as low asnow, is another matter. It is practically impossible, in view of the widely differing conditions, to make any estimate of their capacity to stand the strain. The Copper Queen and the Clifton mines in Arizona, and a number of others in New Mexico, Utah, and Montana, make copper at a low figure, because either of exceptionally high grade of ore or good facilities for the receipt of fuel supplies and the shipment of metal. At a price of 15 cents in New York, black copper is worth from 10 to 13 cents at the mine only, according to rates of freight and purity of metal. In districts like the Globe, of Arizona, where English coke costs from $65 to $70 per ton and the freight to market is correspondingly high, the cost of smelting oxidized ores will not fall much below from $16 to $20 per ton, which makes the working of any ores lower than from 10 to 12 per cent practically impossible. Unless the railroad companies lend a number of the Western enterprises a helping hand in the way of a reduction from the present high rates, many works, especially those lacking a substantial backing of capital, will have to close down.

PETER COOPER.

The departure of PETER COOPER was the peaceful close of a memorable life. If ever the contemplation of death can be not merely without terror, but even without pain, it is in such a case as this, where, surrounded by the loving circle of children to the third and fourth generation, and by hosts of warm personal friends, loaded with well-earned honors and cheered with the enthusiastic affection of the civilized world, a man who has done great things for his kind goes in the ripeness of age to his rest and reward.

PETER COOPER had long outlived his proper contemporaries; and this generation, which knew him best as a benefactor, had never known him as a bold inventor and enterprising pioneer in great business adventures—still less as an industrious mechanic, practicing a patient perseverance and a frugal economy which seem nowadays to have gone somewhat out of fashion. It is hard to realize that his life covers nearly the whole history of the United States. Born in the middle of WASHINGTON'S first presidential term, when the population of the country was about 4,000,000 souls, he lived to see it the most powerful of Christian nations, containing more than 58,000,000 inhabitants, triumphant over internal rebellion, fearless of foreign foes, and filled, from one ocean to the other, with appliances of science and monuments of human skill not dreamed of in his boyhood. Except the stationary steam-engine, which had just begun to be generally used when he was born, PETER COOPER witnessed the inception and growth of all the great material improvements which make our modern life what it is. Many of them, notably the railway and the telegraph, he essentially assisted in the days of their feeble beginnings; and his characteristic attitude toward them all was one of encouragement and hope. He was an optimist of the most wholesome type, not believing that things are well enough as they are, but full of a sublime faith that things can be bettered, and ready to welcome with sanguine support all attempts to better them.

In this, as in many other particulars, the history of PETER COOPER is distinctively American. No other country, in the early years of this century, could have given free scope to the versatile ingenuity and unconquerable perseverance with which he turned from one trade to another, until he planted his foot upon the road to fortune. Under other institutions, he would have remained a hatter, like his father, or become a brewer or a coach-maker, after once beginning in either of those trades. But in this free atmosphere, he was able to follow each path that offered itself, to master each business that he undertook, and to leave it for another that promised larger scope. He failed in nothing; each step was an advance; and when at last he took up the manufacture of glue and isinglass, the principal occupation of his life, he pursued it with an unwearied and unconquerable ardor as truly American as his versatility.

Another peculiar feature of his career was his conception of the uses and duties attached to wealth. He felt bound by the very fact of his prosperity not only to relieve the unfortunate, but also to organize agencies which should permanently benefit the city, the growth of which had been the basis of his own success, and the working-classes, by whose co-operation all great fortunes are built up. The absence of governmental endowments for charity and for learning has always rendered the claims of these objects upon individual g nerosity stronger in this country than elsewhere. Public spirit has done among us more than official action could have accomplished; and this spirit, fostered by our political system, has gathered strength through the inspiration of great examples, among which that of PETER COOPER is one of the most conspicuous, and has been perhaps the most fruitful. Notable as have been the results directly flowing from his beneficence, they are insignificant compared with the indirect consequences of the noble contagion which his enthusiasm communicated to other men. It is impossible to measure the effect of his example, showing as it does both sides: the joy and potency of a wise benevolence, and the immediate reward which it commands in the affection and praise of all mankind.

We had intended, in commencing this article, to emphasize particularly Mr. COOPER'S earlier achievements, and their relation to the progress of the arts. But goodness is more than greatness; and we feel that the universal feeling is right when it mourns to-day the departure, and rejoices in the history, not of the ingenious inventor, the successful manufacturer, or the enterprising capitalist, but of the lover of men, whose widest schemes, like his most trivial acts and words, uttered his inmost disposition. The Cooper Union, planted by his hand, and tended with daily assiduity by him to the last, bears in every part the indelible marks, not merely of the man's wisdom or philanthropy, but of the man's self. As his benign face has been for years a most frequent and familiar object within its walls, so his gentle soul pervades and inhabits it forever.

For a good many years past, it has been my pleasant duty to take charge of the Saturday evening free popular lecture course at the Cooper Union. Of the thousands who attended these lectures, not one was more punctual and regular than PETER COOPER, and his entrance upon the platform was invariably the signal for an outburst of affectionate welcome. When he spoke, which was but seldom, his simple, cordial utterance had but one burden—the lesson of good will, which his paternal bearing also mutely spoke. As I have witnessed the touching intercourse between that vast, reverent audience and their venerable benefactor, I have often been reminded of the beautiful legend of St. John, who, in his old age, carried to the assemblies of the church at Ephesus, said evermore but this: "Little children, love one another." It was fit to be the last word of an evangelist, apostle, and seer; and it was in substance the word to this generation of one whose life exhibited not unworthily the spirit of the Beloved Disciple.

It is this identification of the man's nature with his actions, rendering them the complete expression of himself, "in whom there was no guile," that wins for PETER COOPER not merely admiration and praise, but the unanimous, ungrudging, rejoicing acclamation of that voice of the people which never more truly echoed the voice of God.

"Not what we give, but what we share!
For the gift without the giver is bare.
Who bestows himself with his gift, feeds three:
Himself, his hungering neighbor, and Me!"

It is impossible, even for those who feel most nearly this bereavement, not to find greater cause for thanksgiving than for grief. The long, noble, fruitful life; the painless end; the fragrant memory; the immortal glory—these have no room for tears.

Now, God be thanked for such a gift!
A human life, so strong, so sweet,
So blessed, so blessing, so complete,
So fit before the world to lift

For pattern and encouragement;
For silent love and echoing praise;
For teaching how earth's wasting days
In heavenly uses best are spent;

What guerdon tireless toil commands;
What triumph waits our enterprise;
How he who serves his kind shall rise,
Upborne upon their grateful hands!

His goodness struck detraction dumb;
He drew the heart of all to his,
And lent unto the life that is
The brightness of the life to come!

ROSSITER W. RAYMOND.

NEW PUBLICATIONS.

THE MINERAL WEALTH OF VIRGINIA, *Tributary to the Lines of the Shenandoah Valley and Norfolk & Western Railroad Companies. By* ANDREW S. MCCREATH, *Chemist to the Geological Survey of Pennsylvania, etc., etc.* Harrisburg, 1888. Octavo, 105 pages.

This book is the result of the new management inaugurated a year ago for the important railroad system named in its title. The determination of this management to make the railroads prosperous by developing as sources of income all varieties of natural wealth in the country traversed by them led to the establishment of a Bureau of Mining Intelligence, under the charge of Mr. J. B. Austin, at Roanoke; and Mr. McCreath was selected as an expert to examine with Mr. Austin the region tributary to the roads. The selection was a good one, the work has been carefully done; and the resulting report is an interesting general survey of the subject.

We extract and tabulate, without comment, the following estimates of the cost of making pig-iron at various localities:

	I.	II.	III.	IV.	V.	VI.	VII.	VIII.	IX.	X.	XI.	XII.
Ore.....	$4.50	$4.73	$4.79	$4.79	$3.40	$9.37	$9.00	$7.60	$9.61	$9.34	$11 81	$9.46
Fuel.....	5.25	4.46	3.69	3.25	3.88	5.02	5.40	7.00	6.67	5.30	3.39	5.64
Limestone	.30	.50	.75	.00	.50	1.00	.85	.56	.95	.77	.77	.42
Labor.....	1.50	2.00	2.10	2.00	2.00	2.35	2.10	3.00	2.45	2.33	2.00	1.59
Incid'ntals	1.00	1.25	1.25	1.25	.48	1.00				2.64		.76
Total ...	12.55	12.94	12.58	11.89	11.03	18.22	18.35	18 16	19.68	20.38	17.97	17.87

I. Cost at Milnes, Va. (2¼ tons ore, 1¼ tons coke, per ton of iron).
II. Estimated cost at Buchanan, Va. (2½ tons ore, 1⅝ tons coke).
III. Estimated cost at Roanoke, Va. (2½ tons ore, 1¼ tons coke).
IV. Estimated cost at Central, Va. (2½ tons ore, 1¼ tons coke).
V. Estimated cost on New River, Va. (2½ tons ore, 1¼ tons coke).
VI. Estimated cost in Middle Pennsylvania (fuel, coal and coke).
VII. Estimated cost at Harrisburg (2¼ tons ore, 1½ tons coal).
VIII. and IX. Estimated cost at two furnaces of the Lower Susquehanna District, a considerable distance apart and on different railroads.
X. Estimated cost in the Lehigh Valley District.
XI. Estimated cost at Pittsburg, Pa. (Lake Superior ore, 1¾ tons).
XII. Estimated cost at Phillipsburg, N. J. (fuel, anthracite).

An inspection of these figures shows that the advantages of Virginia lie chiefly in the cheapness of the ore. Mr. McCreath presents a list of mines which furnish Bessemer ores, twenty-three in number. Of these, we should be inclined to throw out nine, as coming too near the forbidden limit of phosphorus. Mr. McCreath, by the way, puts that limit at 0·14 per cent on the iron in the ore, or 0·13 in the pig manufactured. This may do for Bessemer manufacturers who make their own pig; but we have seen the requirements enforced not long ago by Harrisburg works on outside makes of Bessemer pig; and, according to our recollection, they set the maximum of phosphorus at 0·09 per cent.

In conclusion, Mr. McCreath sums up as follows the advantages for iron-making possessed by this region:

"The ores are abundant, and generally of good quality; they can be econo

Digitized by Google

mically mined; for the country in many localities is broken up by numerous ravines affording natural openings for mining operations; most of the deposits are within convenient distance of the railroads, with easy down grades; the water supply, either for washing ore or for manufacturing purposes, is ample and permanent at all seasons; limestone for fluxing purposes exists in unlimited quantities; and the railroad facilities for reaching markets in every direction are unusually good—thus forming a combination of favorable circumstances rarely equaled."

The next meeting of the Institute of Mining Engineers is to be held at Roanoke.

*

GEOLOGICAL SURVEY OF NEW JERSEY. *Annual Report of the State Geologist for the Year* 1882. Camden, 1882. Octavo, 191 pages. (Index, and a Geological Map of the State.)

In this volume, as in each of its many predecessors, Professors Cook and Smock have presented a most useful summary of the progress of their work and the current developments of the industries of the State. The different chapters treat successively of the United States Coast and Geodetic Survey of New Jersey; Topographical Surveys; Geological Work in Progress; Seaside Developments; Climatic Peculiarities; Agricultural Development in Southern New Jersey; Drainage; Water Supply; Statistic of Ores, Clays, and Clay Products and Lime; and the publications, *personnel*, expenses, and plans of the survey. The most interesting chapters to us are the geological and statistical ones. Professor Cook is proceeding with characteristic caution and thoroughness to attack the difficult problem of the age and stratigraphical relations of the red sandstone district and its intercalated traps. In this volume, he presents a mass of observations, without professing to have collected data sufficiently abundant and precise to permit an assured induction. Concerning the geographical history of this district, he says:

"The hypothesis we are at present disposed to follow is, that the various detached portions of this general formation which are found east of the Appalachians, and extending from Massachusetts to South Carolina, were once, in some way, connected; and perhaps, also, those farther northeast in the British provinces. That after their deposition on a very uneven bottom, the underlying rock has been disturbed by a number of axes of elevation, or else of great faults, which have crossed the formation obliquely but in a direction much nearer north and south than the general trend of the formation. . . . The elevation of these axes would give a general dip of W.N.W. on one side and E.S.E. on the other, but not at right angles to the trend of the formation; and it would not require so great a thickness for the whole mass as has generally been computed. After this process of elevation was well advanced, the eruption of the trap-rocks began, and must have continued for a long period of time. The peculiar curved form of the trap ridges would necessarily occur where the upward force of the eruptive rock was applied against the inclined surface and pressure of the stratified rocks. The denudation of the surface, to the extent of from 100 feet to 600 feet or more, took place after this, but mainly before the Cretaceous period. By denudation, the softer sandstones and shales have been removed to so great an extent as to leave some portion of the Archaic and Silurian rocks entirely uncovered, to leave the red sandstones and shales in the deeper troughs between the axes of elevation, and to leave the hard eruptive rocks, which were but little above the other rocks, now standing out above the plain surface of the denuded sandstones and shales in the long, rocky, and rough ridges which are so prominent a feature of our Triassic formation."

Some trivial criticism might be applied to this statement. The ascription of force to mere "axes of elevation" is an unfortunate use of words; and the limitation of the effect of this force, or of faults, to "the underlying rocks," intimated by the language employed, is evidently not intended. We presume also that Professor Cook means "Archæan" when he says "Archaic." Apart from these small blemishes of expression, the hypothesis here suggested seems to us more probable than those of Rogers, Kerr, Heinrich, and others who have written on the subject. Elsewhere in this report, Professor Cook speaks of the rarity of clear exposures of faults in the sandstone formation. But the probability of the existence of many small dislocations is not only indicated, we think, by the rock itself, but by the analogous fractures of the crystalline rocks on the northwest. A system of oblique axes of elevation, with oblique subordinate faulting movements, is just what the phenomena of the Jersey gneisses suggest; and it is no small argument for Professor Cook's hypothesis, that it promises to harmonize the two halves of the State, by referring the structure of both to similar continental strains.

The mineral statistics of New Jersey for the year 1882 are given by the report as follows:

Iron ore carried by railroads	897,183	tons.
Received at furnaces by team	35,579	"
Total	932,762	"
An increase over 1881 (737,052 tons) of	195,710	"
Product of zinc ores (used at Newark and Bethlehem)	40,138	"
Product of clay, feldspar, kaolin, fire-sand, and molding-sand in Middlesex County	315,000	"
Ditto in Camden County	38,100	"
Total manufacture of bricks (an increase of 34,000 thousand over 1881)	150,000	thousand.

The subjects of water supply, including rain-fall, drainage, wells, etc., are treated at considerable length; and the nature and amount of the supply of the principal cities of the State are described. The principal expenditure of the survey has been for topographical work. The annual appropriation is $8000; and this book shows that a good deal is done with that small sum. Such workmen, in such a work, ought to have more means.

*

AN INDEX TO THE POPULAR SCIENCE MONTHLY. New York: D. Appleton & Co. 1883. 8vo, pp. 169. Price, $1.

The title index to the twenty volumes of the *Popular Science Monthly*, from 1872 to 1882, just issued, will be welcome to the readers of that progressive review.

THE WORLD'S PRODUCTION OF SULPHURET COPPER ORES. Issued by the Coxheath Mining Company, Boston. 8 pages.

This little pamphlet contains a good review, from the pen of Mr. Joseph W. Revere, of the principal localities from which sulphuret copper ores are obtained in this and other countries.

CAMERON'S PLASTERER'S MANUAL. Revised Edition. By K. CAMERON. New York: William T. Comstock. 1883. Sq. 12mo, 67 pages.

Mr. Cameron has published a revised edition of his Plasterer's Manual, having added a number of illustrations and recipes, and a new chapter on practical suggestions and precautions. It is intended for and well serves the purposes of apprentices, to whom a good guide of the kind will prove valuable.

OFFICIAL STATEMENTS AND REPORTS.

THE ALLOUEZ MINING COMPANY, LAKE SUPERIOR, MICH.

According to the statement of the directors of this company, the product of the mine during the year 1882 was 2,299,445 pounds of mineral, yielding 73·22 per cent, or 1,683,557 pounds of refined copper, for which, estimating the copper on hand at the close of the year (396,690 pounds) at 18 cents per pound, there was realized an average price of 17·86 cents per pound, or $300,818.19. The profit, after deducting the total working expenses, was only $8268.46; but as $20,347.05 were paid out for buildings, real estate, and machinery, there was a deficit of $12,078.59, which reduced the net surplus of December 31st, 1882, from $87,120.74 to $75,042.15 in the beginning of this year, provided the copper on hand realized 18 cents. The company did a very large amount of dead-work, which increased current expenses, and which also brought down the average yield of the rock. As the surplus consists of supplies, the company levied an assessment of 50 cents per share, or $40,000, to provide for improved machinery. The mining work embraced 327 feet of shaft sinking, at $26.93 per foot; 54 feet of winzes, at $15 per foot; 1498·4 feet of drifting, at $11.71; 51 feet of drifting for pillars, at $13.86 per foot; 813·7 fathoms of rising slopes, at $8.64; 2324·9 fathoms of stoping with power drills, at $8.05 per fathom; and 2619·3 fathoms of stoping by hand at $10.88; the cost of running the compressor and power drills, inclusive of repairs, being $10,370.51. The wages paid to timber-men, trammers, blacksmiths, etc., were $37,966.14, to which, added supplies, makes the total for underground expenses $139,069.08, or, less profit on supplies sold to contractors, $8846, $130,223.08. In all, 112,892 tons of rock were mined; 107,079 tons were hoisted, at an expense of $19,594.45, of which $2664.64 went for wire rope and supplies, $9860.80 for fuel, and $7069.01 for labor. The cost of breaking and selecting the rock was $22,698.78, a figure which seems high in view of the slight quantity of rock finally rejected, not quite 10,000 tons. The heaviest item is labor, $14,016.58, followed by $4835.60 for fuel, and $3788.75 for castings and supplies. The surface expenses were $11,742.23, including $8808.36 for salaries and wages, $2495 taxes, $1512.41 insurance, and $1550.50 supplies. The railroad carried 97,232 tons of rock at a cost of $13,203.75, which was crushed in the stamp-mill at a cost of $53,987.77, including $24,470.91 for 7528 cords of wood, or one cord per 12·9 tons, $20,396.03 for labor, $3589.36 for supplies, and $5531.47 for repairs. Among the mineral expenses, $5028.41, figures transportation to Hancock, $3783.96. Reduced to cost per ton of rock milled, those figures stand as follows:

Mining	$1·3393
Hoisting	·2015
Selecting and breaking	·2335
Surface expenses	·0867
Transportation to mill	·1358
Milling and washing	·5552
Expenses on mineral	·0517
Total per ton milled	$2·6027
Total per ton mined	2·2426

The yield of copper per ton mined was 14·91 pounds, and per ton milled 17·31 pounds, or 256 pounds of refined copper per fathom of ground broken. The cost of mining and milling copper for the Allouez was, therefore, 15·04 cents during 1882. To this, however, must be added $39,381.39 of other expenses, including $8332.08 for freight, $22,351.63 for smelting (1·33 cents per pound), $1683.75 for commissions and brokerage, and a number of sundry expenses, or 2·34 cents, making the total 17·38 cents per pound.

In the machinery purchased, we note a Rand duplex, 16½ by 30, compressor, costing, with freight and labor, $5752.91; eight Rand drills, $3628; a Worthington duplex pump for the mill; and a small Knowles pump for the mine.

Mr. Frederick Smith, the agent, speaks encouragingly of the mine. He advises the addition of the second half of the compressor, so that all underground work can be done with the power drills.

RIDGE COPPER COMPANY, LAKE SUPERIOR, MICH.

The annual report of the Ridge Copper Company is interesting, because it is one of the smaller mines whose existence is seriously threatened by the recent decline in copper. The product of the mine was 102,936 pounds of copper, which, including the mineral at the mine, realized only $17,097.44, while the mine and other expenses were $36,482.08, leaving a deficit of $19,384.64. An assessment of $10,000, or 50 cents per share, was levied; but it was difficult to collect it, 2476 shares being forfeited. The directors ask the stockholders for consent to sell, notwithstanding the urgent request of the agent, Captain S. B. Harris, to continue work. The Ridge paid $50,000 dividends on February 24th, 1873; $20,000 on February 23d, 1874; the same amount on February 8th, 1875, and $9784.50 in 1880, making a total of $99,784.50. On the other hand, assessments to the amount of $210,000 have been levied.

HURON COPPER MINING COMPANY, LAKE SUPERIOR, MICH.

The work of the Huron has been largely one of preparation, and the expenditures have been excessive on account of the necessity of hauling rock to the old Pewabic mill, the old Huron mill being almost useless. Work in building the new mill was begun on the 1st of December, and it is expected that the mill will be ready for work early in the season. During the year, 269 feet of shafts, 261 feet of winzes, and 886 feet of drifts were run, at a total expense of $57,626.87, including timber, supplies, wood, etc. Surface expenses footed up $19,581.80, and the expense of crushing 8552 tons of rock, yielding 2·52 per cent of mineral, was $10,018.39. Diamond drill explorations on the conglomerate vein cost $695.46; construction expenses, $4380.28, and all other expenses were $6329.48. The total product was 445,624 pounds of mineral, yielding 82·113 per cent of copper, or 364,037 pounds of ingot, of which 292,500 pounds were sold at an average price of 18·355 cents. The total receipts were $135,284.46, including $21,701.23 cash on hand, and a loan of $54,000, of which $32,500 were paid and were included in the expenditures, leaving the cash on hand $2425.94. The assets include copper on hand and supplies, a total of $45,510.26; the liabilities being $67,144.72. The agent's valuation of the machinery and buildings is placed at $124,201.41. Mr. J. Vivian, the superintendent, reports that a very good piece of ground has been opened on the seventh level, the lode being from 18 to 20 feet in width.

THE NICHOLS FURNACE.

In order to lessen the cost of transportation, Messrs. Nichols & Co., of the Laurel Hill Chemical Works, Long Island, New York, some time since themselves began the smelting of the cinders obtained after roasting cupriferous pyrites in kilns, for the manufacture of sulphuric acid. Under the direction of Mr. J. B. F. Herreshoff, experiments were made with the view of improving the construction of the ordinary furnaces, and the result of these efforts was the construction shown in the accompanying illustrations. As will be seen, the furnace has the general type of modern American copper furnaces, the main point of novelty in the design being the construction of a removable outside well or hearth. The principal object is to separate from the furnace proper that part which is particularly liable to create stoppages and repairs, so that runs over long periods can be made. The entire product of the furnace flows directly into the well. Near the bottom of the furnace is an opening, 7 by 6 inches, the circle of the furnace being flattened at this point to allow of close contact with the water-jacket face of the well. The face of the well is formed by two square frames of wrought-iron, covered by soft sheet-steel or boiler-iron, in such a manner as to leave a water-space between, and the smaller inner frame corresponding in size and hight to the opening in the furnace. The well itself is built of ribbed cast plates, bolted together, lined with fire-brick and mineral wool, to prevent chilling, and mounted on wheels, with a flat-arched brick-lined cover. Near the top, on the side away from the furnace, is a regular slag-spout, and below on one side a tap-hole and spout for the metal, which can be tapped at intervals; or, in case of lead, a small outside dipping-well can be bolted on, as usual, on the furnace itself. The offset shown in the upper part of the well is not necessary. It is preferred, especially with basic slag, to have it straight, to avoid cutting by the upward flow of the slag. The well is guided to its place against the furnace by the two outside rails. Rubber hose connections are attached to the water supply pipes, and then the blast is let on to the furnace. Any slag which might naturally leak between the two faces is immediately chilled, and forms a perfectly tight packing between them.

The following is a record of a number of the furnaces at the Laurel Hill Works, for a number of days, as taken from the charging-books. The 48-inch furnace was first built; then the 60-inch, which, however, proved of too large a diameter, when the 36-inch by 66-inch furnace was erected.

As already stated, the ore was pyrites, containing between 3 and 4 per cent of copper, the fuel employed being common gas-coke. We may add that the inventors have made arrangements with Messrs. Fraser & Chalmers to build the furnaces as modified:

TESTS OF EXPLOSIVES.

In the Proceedings of the U. S. Naval Institute, Prof. Charles E. Munroe, U.S.N.A., has reviewed a report on vigorit powder, made by Lieut. W. R. Quinan, U.S.A., General Superintendent of the California Vigorit Powder Company, which contains interesting data on the methods of testing explosives employed. These Professor Munroe considers sufficiently trustworthy for the object in view, although somewhat rough and not wholly new. Professor Munroe summarizes the contents of the report, of which a copy has not yet reached us, as follows:

The iron plate and éprouvette tubes were discarded as delusive or as being advantageous to slow-burning powders, and a simple form of the "crusher-gauge," with lead cylinders, was employed. This gauge consisted of a heavy iron base, supporting four vertical wrought-iron guides, which were connected at the top by a ring. The lead plug is placed on the base; a piston weighing 12¼ pounds rests on the plug. The top of the piston is hollowed out to receive the charge, and over this is placed a 34¼ shot of tempered steel. The shot is bored through its axis, to receive a capped fuse. All these parts are between the guides; and when the charge is fired, the piston is driven against the plug, while the shot is thrown out in the opposite direction. To determine the pressure exerted in compressing the plug a given amount, a foot-pound machine was constructed similar in form to a pile-driver with a graduated scale, the shot of the pressure-gauge serving for the hammer and the piston of the gauge for the anvil. This form of apparatus realizes more perfectly than any other the conditions which exist when explosion takes place in a confined space. Tests were made of cast and drawn lead plugs. The cast lead ones were unsatisfactory, while the drawn ones gave very regular results. An apparatus similar to the foot-pound machine was used for testing the sensitiveness of the powders to percussion, and, with the addition of a gas-pipe and wooden tamping-rod, to tamping. With this tamping apparatus, the vigorit powder, as now made, withstood more than a dozen blows of 300 foot-pounds each. The ability to tamp a powder is regarded as quite important, since it enables the miner to put the powder where it will do the most efficient work; hence a powder which can be tamped freely will be found more economical than one which is too sensitive to be tamped at all.

The friction apparatus consisted of a heavy block covered with sand-paper, resting on a board covered in a similar manner. By means of a long handle, the block could be drawn backward and forward. The relative leakage of nitro-glycerine from the various powders was determined by placing equal weights upon weighed slips of bibulous paper for equal times, and then measuring the increase in weight of the papers.

Tests as to the effect of fire were made by ramming vigorit powder into an iron pipe until the pipe showed signs of yielding under the pressure. One end of the pipe was stopped by a wooden plug tightly driven in, and the open end was lighted by a match. The powder burned without explosion. Again, a large cartridge was placed in a small strong box, the lid being securely fastened with screws. A fuse passing through a small hole in the side of the box served to light it. The cartridge burned up without explosion, the box being badly charred on the inside, but not broken.

Lieutenant Quinan regards the property of deliquescence as a most serious one in mixed powders. The progress of deliquescence is thus explained

Digitized by Google

The air confined in the cartridge contains a slight quantity of moisture, which, in uniting with the salt, causes a depression in temperature, which condenses fresh moisture from the surrounding air. This being taken up, reduces the temperature still more and brings a fresh supply, and so on. The process continues until arrested by an outside elevation of temperature, when the action is reversed. In losing moisture, the heat rendered latent is given out, raising the temperature, which causes a fresh loss of moisture and further elevation of temperature, and so on, till a change in atmospheric conditions arrests this process and induces a contrary. This gives two different and incompatible characters to a powder in which deliquescent salts are used, depending upon the particular state in which it is taken; when absorbing moisture, it is comparatively weak and insensitive to blows or compression; when losing moisture, it is comparatively strong and very sensitive to both. The temperature being already elevated, a slight blow will raise it to the exploding-point. The compression given by the tamping-rod in compacting it in the bore-hole may be sufficient to cause a premature explosion. These qualities render the powder unfit to bear climatic changes, and especially dangerous in warm or drying weather. Its constant subjection to chemical action gives it a character of instability especially conducive to disasters in handling it. The powder which is safe to-day and dangerous to-morrow is the most dangerous of all.

The effect of heat on all powders is to bring them nearer their exploding-points, and thus to increase their sensitiveness. This heat makes a slight saving of work in explosion—so that all explosives are a little stronger in warm weather. The danger of deliquescent ingredients is not in lowering the firing-point of nitro-glycerine, but of elevating the temperature of the powder to a dangerous approximation to this point.

The author holds that while in dynamite, the absorbent being inert, the force is dependent upon the amount of nitro-glycerine present, the more modern powders do not depend entirely on this. Citing the experiments of Roux and Sarrau, which showed that, if a fulminate acted through the medium of nitro-glycerine, an explosion of the first order would be produced, he argues that a mixture of nitro-glycerine with the ingredients of gunpowder will develop a much greater force than the sum of the forces of the two fired separately. In this he differs with Hill and Mowbray, while he is supported by Drinker. He also claims that any thing in a powder which interferes with the transmission of the detonating impulse or wave will cause a diminution in strength through imperfect detonation. It requires 60 per cent of nitro-glycerine to make a powder of kieselguhr which can be depended upon to explode at all. As the nitro-glycerine is increased, the strength increases rapidly, through better transmission of the impulse. Even taking 75 per cent as the utmost which the powder will safely hold, the detonation is not perfect under ordinary conditions, though it approaches it more nearly as the impulse is concentrated by stronger confinement.

A Scientific Centenarian.—Rarely in the history of science, says the *Lancet*, has a distinguished career equaled in its length that of M. Chevreul, whose name is best known in connection with his investigations on color; and it is probably altogether unique for a *savant* to be able, before one of the most distinguished scientific societies in the world, to refer to remarks which he made before the same society more than seventy years previously. Recently, M. Chevreul made a communication to the Académie des Sciences, and at its close he observed: "Moreover, gentlemen, the observation is not a new one to me. I had the honor to mention it here, at the meeting of the Académie des Sciences, on the 10th of May, 1812!"

THE MOREY PULVERIZER FOR DRY CRUSHING.

The Morey & Sperry Mining Machinery Company has recently modified the construction of the Howland pulverizer, and, with slight alterations in the design, has adapted it to dry as well as wet crushing. The principal change made consists, as shown in the accompanying section of the dry-crushing pulverizer, in the substitution of balls for rolls. Through the gearing *K K* the disk and cone *H* is rotated, carrying with it the balls *B*, which are carried by centrifugal force against the concave annular ring *C*, which is cast in one piece of chilled iron, or is made of rolled steel in the same way as locomotive tires. The balls are surrounded by cages or guards *A*, in which they play freely. To give them greater strength, they are connected by a heavy ring. At the points along which the balls slide over the disk, a piece of flat steel is dovetailed in, to protect it against wear. In dry crushing, the machine is covered with a hopper, to feed the machine, and air circulation is provided by a blower or a suction-fan, the air passing upward through an annular space behind the ring *C*.

THE CAREER OF PETER COOPER.

The venerable Peter Cooper, who died in this city after a brief illness, of pneumonia, on the 4th inst., was born on the 12th of February, 1791, his father being a hatter in this city, whose efforts in business were not successful, so that Peter, like the rest of the children, had to undergo many hardships during his youth and was denied the advantages of school except at intervals. His father moved from place to place a number of times, and engaged successively in keeping a country store at Peekskill, a hat-store, and a brewery, his son helping him in his work until he reached his seventeenth year, when he was apprenticed to a firm of carriage-makers in this city, with whom he remained until he was of age. During his four years of service, he had found work at carving wood for carriages, in which he became an expert. By doing this in his leisure hours, he was able to add to his slender income. The additional sums which he obtained he devoted to buying books and to paying for the services of a teacher in the evening. This period of his life taught him the value of evening schools, and it is said he then determined to devote his years to the accumulation of wealth, that he might found an institution where working boys and girls could find free instruction.

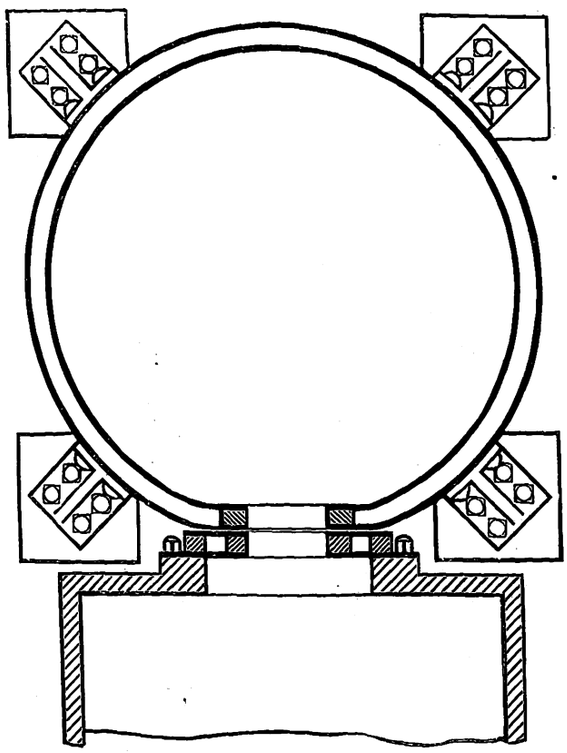

Fig. 2.—Horizontal Section Through Furnace.

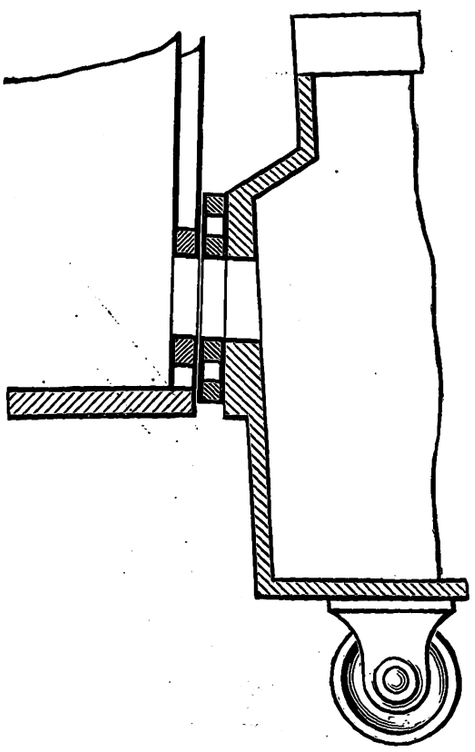

Fig. 3.—Vertical Section Through Furnace and Well.

He launched out in business after having worked in a woolen factory at Hempstead, Long Island, where he invented a machine for shearing the nap from cloth, from the sale of which he realized considerable money. Then he became a cabinet-maker, only to continue the business one year, when he sold out to open a grocery store, which he removed within a year after he opened it; and finally sold out this business to carry on a glue factory—six changes in nine years. This might be regarded as an evidence or instability and fickleness. But at every step there was a movement for the better. He lost no money; on the contrary, he constantly increased his accumulations. The last change was for a permanency. He continued his business in the same place for twenty-five years; and when he finally made an alteration, it was only to build a larger factory on cheaper ground, and to remain a glue manufacturer until he died.

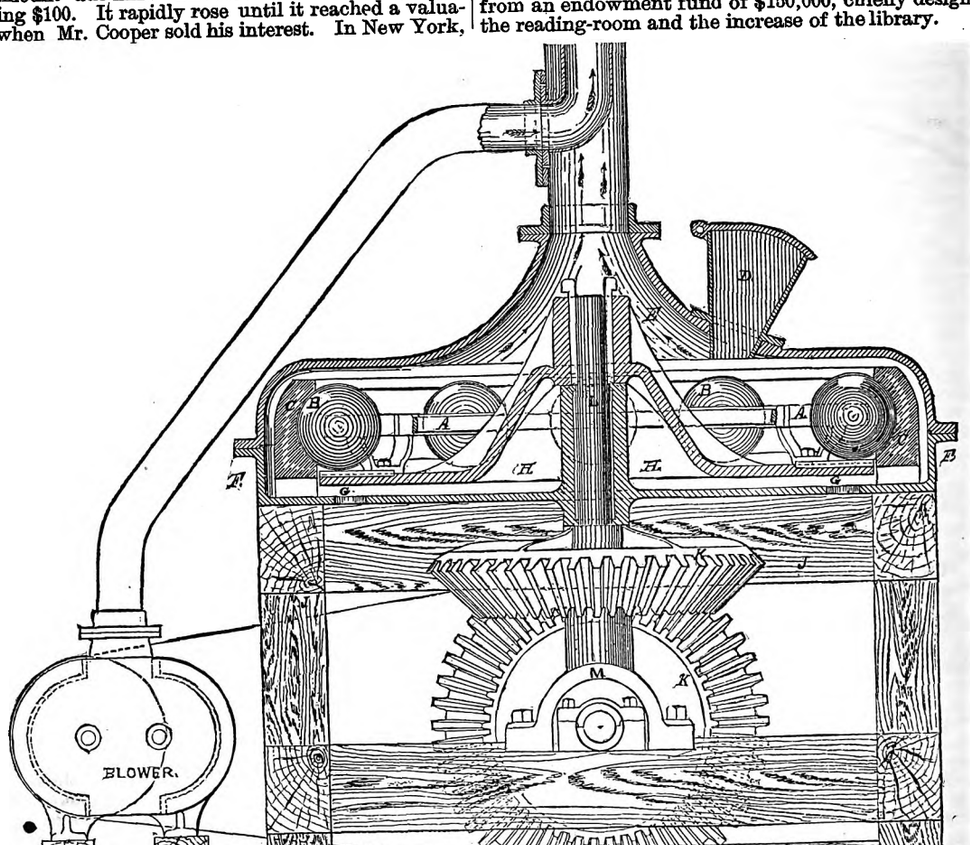
Ten years of this business had made him a rich man, as wealth was measured fifty years ago. He had accumulated a large surplus capital available for investment. One day, two men proposed to him that the three make a purchase of land in Baltimore, and offered him a third interest in 3000 acres at a price of $103,000. The land was within the city limits, and took in the whole shore from Pell's Point dock for a dis-

Digitized by Google

tance of three miles. Mr. Cooper paid his part of the purchase-money, but soon discovered that neither of his partners had paid any thing. He offered them $10,000 to withdraw, and they accepted it. The land was unprofitable; and in order to get a return for the investment, he built iron-works on the ground. He owned 400 or 500 tons of iron ore at Lazaretto Point, and determined to cut off the wood from the land and make charcoal iron. He built a rolling-mill and constructed furnaces twenty feet in diameter.

Those were the early days of railroads in America. Not a single locomotive had been constructed here. The Baltimore & Ohio Railroad Company had built only thirteen miles of its road, and was having so much difficulty with sharp curves as to think of abandoning the whole project. In the first year, they had expended all the subscribed stock, and the stockholders, thoroughly discouraged, had refused to pay any more. Mr. Cooper came to their aid by building a locomotive that would run on curves. When it was completed, he attached it to an open box-car, and with himself as engineer gave the directors a ride over the thirteen miles of road, covering the distance in one hour and twenty minutes; the returning trip was made in fifty-seven minutes. This decided the fortunes of the road, and it was then completed.

Mr. Cooper sold his Baltimore property to two capitalists, who formed the Canton Iron-Works, in the stock of which Mr. Cooper took a considerable part of the amount due him. The stock was taken at $44 per share, the par value being $100. It rapidly rose until it reached a valuation of $230 per share, when Mr. Cooper sold his interest. In New York, he built iron-works in Fourth avenue, near his glue factory, and during the next two or three years manufactured large quantities of wire. The mill, however, was used mainly in puddling and rolling iron. He then removed the iron-mill in Fourth avenue to Trenton, where he put up additional iron factories. He was the first person to manufacture railroad iron in this country. In planning his future "Cooper Union," he desired it to be fire-proof, but was unable to obtain the necessary iron beams. He then expended $75,000 in machinery for rolling beams such as are now used in building, being also the first person in the country to engage in this enterprise.



The Trenton venture proved successful, and the works were enlarged from time to time until they have become very extensive. At Phillipsburg, Pa., he built three large blast-furnaces, and he bought the Durham furnace, three miles from Trenton. The production of his mills was not confined to building and railroad iron, but included various kinds of wire, such as he had made in New York, and many other manufactures of iron. For the Durham furnaces, he paid $260,000. He also bought the Andover iron mines; and to transport the ore to his factory, he built a railroad eight miles in length over a rough country, on which he could transport 40,000 tons a year.

Mr. Cooper took an active interest in the development of the telegraph and cable system, being identified with a number of the earlier enterprises.

Twenty-five years ago, the foundation-stone to the Cooper Union was laid, and thus the enterprise realized which had been the aim of his life. A scroll was buried with the corner-stone, which bore the inscription: "The great object that I desire to accomplish by the erection of this Institution is to open the avenues of scientific knowledge to the youth of our city and country, and so unfold the volume of nature that the young may see the beauties of creation, enjoy its blessings, and learn to love the Author from whom cometh every good and perfect gift."

The school was "to be forever devoted to the union of science and art in their application to the useful purposes of life." Five years passed before the building was finished. It is a brownstone and iron structure, thoroughly fire-proof, of massive Roman architecture, an irregular quadrangle in shape, having dimensions on its four sides of 90, 146, 165, and 195 feet. Its original cost, exclusive of the site, which had been purchased about twenty-five years before for this very purpose, was $964,000. In 1869, Mr. Cooper gave a deed of trust of the property to a board of trustees, consisting of Mr. Cooper as president, Daniel F. Tiemann, Edward Cooper, Wilson G. Hunt, John E. Parsons, and Abram S. Hewitt. In the same year, $10,000 were given to meet the immediate wants of the institution, and $20,000 for the establishment of a museum. Other gifts made a total of $700,000.

Of the splendid success of the institution in supplying the want which it was intended to meet, a recent annual report of the curator gave ample evidence. Every department was full to overflowing. More than 3000 pupils had entered the various classes. Between 400 and 500 applications had been put on file, to await the retirement of those who already held places in the classes. The instruction and lectures which these pupils enjoyed were given to them absolutely without charge. The expenses of the various departments amounted to $50,769, all of which was derived from the rent of stores and offices occupying three stories of the building, from the rents of the larger and smaller halls for public meetings, and from an endowment fund of $150,000, chiefly designed for the support of the reading-room and the increase of the library.

THE MOREY PULVERIZER, FOR DRY CRUSHING.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

Bessemerizing Copper Matte in a Reverberatory Furnace.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In response to Mr. Howe's article in your issue of March 17th, allow me to state the following concerning my suggestions as to a modified plan of copper smelting.

The facts which caused me to think of my plan were the following: In the second volume of *Jern Kontorets Annaler*, 1882, translated in the *Berg- und Hüttenmännische Zeitung* the same year, Dr. A. Tamm, of Stockholm, describes how copper matte was successfully treated in a converter at Eguilles, in France, when he was there in 1881. Dr. Tamm says, page 115: The temperature is raised during the process by the oxidation of the sulphur and the iron, this being indicated by a brighter color of the tapped product. In 1881, successful experiments were carried out at Kohlsva, in Sweden, in order to make steel in an open-hearth furnace, by blowing air on the surface of the molten pig-iron. These experiments had been suggested some two or three years before by Magnus Lindberg. These two facts suggested that, if it is possible to make steel in a converter as well as in an open-hearth furnace, and if copper matte can be bessemerized in a converter, the latter can be treated also in an open-hearth furnace. The latter method ought to be better for matte, because the slag can be skimmed off and the fluxing substances be put in. To oxidize a product in an open-hearth furnace by blast through inclining tuyeres is, as Mr. Howe knows, not new. In copper smelting they

Digitized by Google

employ in Germany and Hungary a so-called "spleiss-öfen," in which an impure coarse copper is treated by blast acting through inclined tuyeres on the surface of the bath, causing sulphur and arsenic to pass away as gaseous products, and scorifying iron, lead, tin, etc. In England, in many blister furnaces, two inclining holes are provided at each side of the furnace, near the fire-bridge, allowing the air to strike the surface of the bath, thus causing a more vigorous oxidation of the metal than when the air enters the side-door. It is obvious that this latter method is unsatisfactory. To propose heating by gas (as is now generally done in the metallurgy of iron), for the treatment of matte for blister copper, is very natural, considering that the main point in this process is a strong oxidizing flame, which is more slowly and incompletely obtained by employing a common coal furnace. The two facts, the successful treatment of copper matte in a converter in France, and the successful treatment of pig-iron for steel in an open-hearth furnace by blast through inclined tuyeres at Kohlsva, in Sweden, combined with the easily-regulated flame gained by employing gas-furnaces, were the only causes of my proposition to treat copper matte in the manner described by me.

I will now proceed to Mr. Howe's four points. When Mr. Howe read my plan and came to the two working-doors, he ought to have observed that in my description the working-doors were situated *opposite* each other, in the *middle* of the sides of the furnace. During all the time I was at Bergen Point, there was no smelting-furnace that had such doors. This had a natural cause, the furnaces being common draught-furnaces fired with coal, with one door at the side and the other at the end of the furnace. Mr. Howe thought, probably, that I was thinking of the ore reverberatory smelting-furnaces in England, where there is no need of more than one door below the flue. Mr. Howe had also a wrong idea about the two arches with a space between them. I proposed that the two arches with a space between them should go all along over the furnace. Not long ago, a beginning was made in using these furnaces in treating iron; but I do not believe that a single furnace built in this way is used in copper smelting. The so-called double arches of the furnaces at Bergen Point are only above and around the fire-place. Mr. Howe's fourth remark concerns the tuyeres. As for placing them, I can find no other reasonable way than that I proposed. As I hear from Mr. Howe, he has also tried to have them immersed and horizontal. I would not at all advise this in my plan, because, when I shut off the blast, to skim the furnace, the tuyeres would only be clogged up. If Mr. Howe will ask Mr. Gibb, Manager of the Elizabeth Copper-Works, he will tell him that he, many years ago, in England, made experiments by blowing air through inclined tuyeres on sulphide of copper, in order to hasten the oxidation. As Mr. Howe may thus see, there is nothing new in treating copper matte in a reverberatory furnace by inclined tuyeres. But I believe that no one has tried or proposed to treat copper matte as I have described it in the ENGINEERING AND MINING JOURNAL of March 3d, in a gas-furnace, using water-cooled inclined movable tuyeres. This combination I, for my part, consider to be an essential condition for the successful execution of the process. PAUL JOHNSSON.

ISHPEMING, MICH., March 26, 1883.

We have made room in the above, in fairness to Mr. Paul Johnsson, to extracts from a long letter written to us by him, so far as he raises points of technical interest. In other portions of his communication, he alleges that he spoke to different officers of the Orford Nickel and Copper Company of his plans before he knew of the fact that they had experimented in the same direction or was acquainted with the details. As this part of the subject is not one on which a discussion is likely to interest the readers of the ENGINEERING AND MINING JOURNAL, we dismiss it.—EDITOR E. AND M. J.

Rotary Pump.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Can you inform me who manufactures a centrifugal pump capable of forcing water 100 feet perpendicularly? I have seen such a pump of French manufacture working on the island of Cuba, throwing water 110 feet, and running at a speed of 400 revolutions per minute. C. B.

MANHATTANVILLE, March 31.

THE CHEMISTRY OF THE BESSEMER CONVERTER.

On March 10th, Mr. J. E. Stead, F.I.C., F.C.S., the eminent metallurgical chemist, of the well-known firm of Pattinson & Stead, delivered an interesting lecture before the Cleveland Iron Trade Foremen's Association, Middlesborough.

The lecturer began by saying that the Bessemer converter was by far the most important metallurgical instrument of modern times. It had become even more important during the last few years since the discovery and practical development of the basic process, commonly called the Thomas-Gilchrist process, from the names of the inventors. By means of that system, as is well known, immense quantities of phosphoric pig-iron which have before been deemed to be unsuitable for making steel have been rendered in a commercial as well as chemical sense available for the Bessemer process. This fact—for, notwithstanding the contrary opinions of some authorities, it is a fact—is of special importance to such districts as that of Cleveland, where there is made annually an enormous quantity of phosphoric pig-iron, which might, by means of the new system, be converted into excellent steel.

Before entering upon the chemical details, Mr. Stead exhibited a series of views showing various kinds of Bessemer plants. These were, first, the ordinary old-fashioned English Bessemer pit, with a converter on each side, blowing in opposite directions; secondly, a more detailed view of the converter, with plan of plug and arrangement of tuyeres; thirdly, a plan of the Barrow Hematite Iron and Steel-Works; fourthly, a plan of the steel-works at Rhymney, South Wales, where the converters are side by side, and blowing in the same direction. The lecturer pointed out the great convenience of the Rhymney plant, where the blown metal, after being converted into steel and run into a ladle, is conveyed upon a carriage away from the hot converting-house to the casting-house, where the center crane has the full sweep of its radius for casting. He then exhibited a section of a basic Bessemer converter of the latest type, showing how its shape differs from that of the ordinary vessel, especially as regards the even taper from the body of the vessel to the nose, instead of the turned nose of the old-fashioned converter. This alteration has been made because it has been found by experience that, during the basic process, the quantity of slag and other things thrown out collected at the mouth of the vessel, and nearly choked it up. It is in the lining of the vessel that the first departure from the ordinary Bessemer process is noticeable in the basic system. The material for lining the ordinary vessel is ganister, the composition of which is as follows:

	Sheffield ganister. No. 1.		Sheffield ganister. No. 2.		Good mixture. No. 3.	
Silica	85·0 to		92·0	per cent.	91·20	per cent.
Alumina	4·0	"	8·0	"	6·00	"
Peroxide of iron	1·5	"	2·5	"	1·70	"
Lime	·1	"	·3	"	·25	"
Oxide of magnesia	·3	"	·5	"	·25	"
Potassa	·2	"	·6	"	·28	"
Soda	·3	"	·4	"	·32	"

What is wanted is a substance which will resist the action of very high heats, and be of such a plastic nature, when damp, as to hold together when placed in the converter. Thus it is very necessary to have about 6 per cent of alumina in the mixture, or otherwise it is too sandy, and is a useless lining. It is very important that, in choosing a ganister, only such stones as are very free from the alkalies, potash and soda, are selected, because these bodies, when present only in moderately large quantities, so affect the refractory properties of the bricks as to make them readily fusible at a high temperature.

	Durham ganister.		Durham fire-clay.	
Silica	97.81	per cent.	69·18	per cent.
Alumina	1·50	"	25·90	"
Peroxide of iron	·35	"	2·50	"
Lime	·10	"	·36	"
Oxide of magnesia	·15	"	·41	"
Potassa	·16	"	1·20	"
Soda	·11	"	·45	"

In the Durham ganister, there is only 1·5 per cent of alumina. This is not enough, and such ganister is unsuitable for lining converters. The fire-clay has 26 per cent of alumina, but only 69 per cent of silica. This again will not do, because it melts away almost like treacle, because of the large quantity of potassa (KO_2) and soda (Na_2O) A suitable mixture of the two, however, does very well, and such mixtures are commonly used in the Middlesborough and other districts. In a Bessemer converter which has been used for some time blowing ordinary hematite iron, the lining, although worn away in some places, actually increases in thickness in others, large masses of very refractory slag collecting on the sides of the vessel, which it is necessary to chip off at the end of the week when the vessels are cold. This is no exceptional thing, but very common. The analysis of the material used for lining the vessels working on the basic system is as follows:

	Basic linings.			Basic linings.	
Lime	49·91	per cent.	Oxide of iron	3·46	per cent.
Magnesia	30·72	"	Silica	11·41	"
Alumina	4·50	"		100·00	"

The noticeable feature of this is, that whereas, in the ganister or acid lining, the predominating constituent is silica, in the basic lining there is only 11 per cent of silica, the great bulk of the material being lime and magnesia. Different experimenters have experienced difficulty in using ordinary lime or limestone as refractory lining; but Messrs. Thomas and Gilchrist have succeeded at last in making a basic lining that stands well. There are two or three ways of making good basic linings. The chief one is as follows: Finely-ground magnesian limestone is molded into bricks, which are then calcined in a kiln until all the carbonic acid is expelled, and the substance has shrunk down to about half its original bulk; but they are in this stage ugly, shapeless things, quite unfit for building up a lining, so they are taken to a mill and ground up to a rough powder. This powder is mixed with from 9 to 10 per cent of boiled coal-tar, that is, tar from which the water has been all removed. If any quantity of water remains, the lining is liable to burst, owing to the slacking and consequent expansion of the lime in the composition. This mixture of tar and basic material is thrown in plastic lumps into an annular space, which is formed in the interior of the vessel by the introduction of a cast-iron shell, within which a fire is placed. The basic material, as soon as it becomes hot, melts and naturally fills up the annular space, and becomes quite solid after prolonged heating. Another method is to make bricks of this plastic material in either cast or wrought-iron molds, which, while in their molds, are placed in an oven and baked, when the tar is coked and the material becomes converted into solid bricks. After cooling, the mold is removed, and the bricks of perfect shape are simply built around the inside of the converter without any mortar whatever. When the vessel is ready, molten pig is run in, and the converter being turned up, the blow begins. The following are analyses of the metal charged during the ordinary acidic process:

	Metal used 15 years ago.			Metal used now.	
Carbon	3·50 to 4·00	per cent.		3·00 to 4·00	per cent.
Manganese	·10 " 1·00	"		·10 " 1·00	"
Silicon	2·00 " 3·00	"		2·00 " 3·00	"
Sulphur	·01 " ·05	"		·05 " ·15	"
Phosphorus	·03 " ·10	"		·03 " ·10	"

Many years ago, only such spiegeleisen as contained between 9 and 10 per cent of manganese was available for Bessemer purposes, and the amount of manganese which it was possible to add without making the steel too hard was limited. Consequently the metal was required to be particularly low in sulphur; for it is a well-known fact that the effect of sulphur upon steel is to make it red-short, so that it breaks when rolling. Manganese has precisely the reverse effect. The quantity of the latter required to neutralize the injurious effect of sulphur is from six to eight times its weight; and the old German spiegeleisen being capable only of adding from ·35 to ·4 per cent of manganese, it is clear that the metal, to work well, should not contain more than ·05 per cent of sulphur. At the present time, however, since the manufacture of better class English spiegeleisen, as much as 20 per cent of manganese is obtained, and, by increasing the proportion of manganese added to the steel, a very much

Digitized by Google

larger quantity of sulphur is admissible. Hence it possible to make excellent steel now with metal which a few years ago would have been condemned as utterly unsuitable for Bessemer purposes. During the blow, the object is to remove from the iron its silicon and its excess of carbon, so as to convert it into malleable steel. If it were possible to arrange matters with ordinary hematite pig-iron so that the exact quantities of carbon and other things could be left in the blown metal, it would be a good thing; but this can not be done, and therefore all the carbon must be blown out first of all, and afterward, by the addition of spiegeleisen, it must be replaced in proper proportion. Thus the first object is to rid the metal of its carbon and silicon, which is performed in from twenty to twenty-five minutes. The following is an approximate table of the decline in the percentage of carbon during the blowing:

		At the start.	After 5 min.	10 min.	15 min.	20 min.	25 min.
Carbon.....	Per cent...	3·50	3·60	3·3	3·25	2·00	Trace
Silicon..	" ..	2·25	1·00	0·5	0·20	0·10	Trace
Manganese..	" ..	1·00	0·35	0·2	Trace	....	.....

Thus it will be seen that the manganese all goes in fifteen minutes; the silicon begins to go immediately, and continues to burn away at about the same rate throughout; while the carbon does not begin to diminish appreciably until all the manganese has gone, and nearly all the silicon. At first, it seems as though the carbon increases, but this is not so; the carbon remains about the same in amount, and, as the quantity of other things diminishes, its proportion to the whole is of course increased. The following is a table similar to the foregoing, showing the action when very siliceous pig-iron is used:

		At the start.	After 5 min.	10 min.	15 min.	20 min.	25 min.
Carbon.....(per cent)..		3·50	3·60	3·30	2·5	1·0	trace
Silicon	" ..	3·00	1·75	0·25	0·9	0·7	0·5
Manganese..	" ..	0·75	0·25	Trace	....	...	...

Here again it will be seen that the manganese disappears first; the silicon begins at once to go rapidly—so rapidly, indeed, that the very great heat causes the carbon to commence to burn away sooner than usual, and the carbon disappears almost while there is a small percentage of silicon yet remaining. This is what was called a hot-blow; and it is desirable, during a heat of this kind, to add cold material. With such metal as this, the blower is able from previous knowledge to ascertain, a considerable time before the end of the process, that the temperature is going to be excessive, and in such cases he reduces the temperature by the addition of cold scrap or pig metal. When the temperature is not excessive, the silicon entirely disappears before the carbon; consequently the whole of the oxygen entering at the bottom of the bath goes to burn the last traces of carbon, which is therefore very rapidly effected, and the large flame of carbonic oxide at the mouth of the vessel suddenly drops, indicating at once to the blower that the operation is ended. But when silicon is present during the elimination of the last traces of carbon, the flame does not drop so suddenly; for the oxygen is then divided in its action between silicon and carbon; consequently the burning of the last parts of carbon is not so rapid, and the flame, instead of falling suddenly, fades gradually away. When this happens, the blower knows that he has silicon left in the bath, and continues to blow until dense brown fumes appear, which is an indication that the oxygen entering at the tuyeres, after burning all the silicon, is beginning to burn the iron. The sulphur and the phosphorus in the ordinary acidic process are not affected to any extent; they apparently increase; but this is only relative, and is owing to the disappearance of the other ingredients. It will be observed from the foregoing remarks that, as the temperature of the metal increases, the relative attractions of silicon and carbon for oxygen approach each other. At first, when the metal is cool, the whole of the oxygen, practically speaking, is taken up by oxidizing silicon; but after a certain period, when the temperature is considerably increased, the carbon begins to burn along with the silicon, and toward the end of the blow it will be seen, from the analysis of the siliceous blow, that the attraction of carbon for oxygen is as great as or greater than that of silicon. This question of temperature is of the very greatest importance in making steel castings free from blow-holes; for if the carbon has a greater attraction for oxygen than silicon has, the addition of silicon to the bath, for the purpose of producing sound steel, will be of no benefit whatever, and the so-called Terrenoire process of making sound castings must necessarily depend as much upon the correct temperature of the metal as upon the chemical constituents. Mr. Stead strongly advises that very much greater attention be paid to the proper adjustment of temperature at the time of casting, in order that uniformly solid and homogeneous steel may be produced. The following tables show the changes which take place when metal containing about 3 per cent manganese is used:

		At the start.	After 5 min.	10 min.	15 min.	20 min.	25 min.
Carbon	Per cent.	3·52	3·60	3·30	2·50	1·00	Trace
Manganese....	"	3·00	2·00	1·25	0·75	0·65	0·35
Silicon.....	"	1·25	0·60	0·20	0·10	Trace	.....

It will be seen from this that a considerable quantity of manganese remains in the steel at the end of the blow after all the carbon is removed; and in practice, where such metal is used, they can, by the aid of the spectroscope and by taking samples of the slag and metal a few minutes before the perfect elimination of the carbon, ascertain exactly when the proper proportion of carbon remains, at which point the metal is simply poured out of the ladle and cast in the ordinary way, no addition whatever of spiegeleisen being necessary. As manganese in burning gives out a considerable amount of heat, it is not necessary, when it is present, to have more than half the usual quantity of silicon in order to give the heat necessary for the proper conduct of the process.

Mr. Stead, turning his attention to the basic process, gives the following table, showing the composition of the metals commonly used in that process:

METALS FOR BASIC PROCESS.

	No. 1.	No. 2.
Carbon	3·35 per cent.	3·50 per cent.
Manganese	·60 "	1·00 "
Silicon	1·30 "	1·00 "
Sulphur	·15 "	·12 "
Phosphorus	1·75 "	2·75 "

The special difference between this metal and that which is charged in the ordinary converter is the large percentage of phosphorus; and it is to effect the removal of this element that the basic system was called into existence. When the metal is charged into the vessel, from 15 to 17 per cent of well-burned lime is also put in, for the purpose of absorbing the silica and phosphoric acid produced by the oxidation of silicon and phosphorus, which, if no lime were present, would assert themselves by eating away the lining of the converter, which would in such a case be rapidly destroyed. The following table gives the approximate rates at which the various substances disappear from phosphoric pig-iron during the blow:

		At the start.	After 5 min.	10 min.	15 min.	18 min.
Carbon	Per cent.	3·50	3·55	2·35	0·07	Trace
Silicon....	"	1·50	0·50	0·09	Trace	.....
Manganese..	"	0·71	0·56	0·27	0·12	Trace
Phosphorus.....	"	1·57	1·60	1·43	1·22	0·08
Sulphur...	"	0·16	0·14	0.13	0·12	0·10

From this it will be seen that, as in the ordinary acid process, the carbon at first increases slightly, and afterward rapidly burns away, while the silicon is speedily eliminated during the first few minutes of the blow. The manganese also is burnt out before the end of the operation, but not quite as rapidly as in the acid-lined vessel. Practically, no phosphorus is eliminated until the whole of the carbon has been removed. The reactions which really take place in the basic process have been very carefully and systematically investigated, and are of great interest to those concerned in the chemistry of the process. The Bessemer converter had always been classed as a great oxidizing apparatus, and, looking at it as a whole, it is so; but it would be quite as logical to state that the blast-furnace, which all consider to be a reducing machine, is also an oxidizing apparatus. The fact is, that both are oxidizing and reducing. In the blast-furnace, the oxygen entering in at the tuyeres oxidizes the carbon in the coke, producing heat; but in the higher reaches of the furnace, the gases so formed, and the unoxidized carbon, are very powerful reducing agents, and effect perfect reduction of the iron ore charged. In the Bessemer converter, there is also a lower or oxidizing part and an upper reducing region. At the lower part, near the tuyeres, the oxygen rapidly enters into combination, not, as some would suppose, with the elements exactly as in the order shown in the ultimate analytical tables, but with the whole of the constituents all together, in the proportion in which they are present, producing a very highly basic oxide of iron cinder. This cinder, passing upward through the column of metal, which, owing to the rushing of air through it, is in violent agitation, reacts upon the silicon and manganese, and at the same time also upon phosphorus, producing silicate of iron, silicate of manganese, and phosphate of iron. As the cinder is more and more intimately brought into contact with fresh portions of metal, the greater part of the oxide of iron is reduced, the iron returning to the bath at the same time that the silicon and manganese are oxidized. These reactions may very briefly be described by means of chemical symbols; thus:

1. $Air + Fe_n = FeO_n + N$
2. $2FeO + Si = SiO_2 + Fe_2$
3. $FeO + Mn = MnO + Fe$
4. $6FeO + 2P = FeO,P_2O_5 + 5Fe$
5. $FeO,P_2O_5 + 6C = Fe + P_2 + 6CO$
6. $FeO,P_2O + 3Si = 3SiO_2 + P_2 + Fe$

It will be seen from the last two reactions, Nos. 5 and 6, that, as long as carbon and silicon are in the bath, there being a large head of metal over the tuyeres, practically no phosphorus can be eliminated. If, however, the bath were shallow, or the tuyeres were caused to inject air forcibly upon the surface of the metal, there being on the surface at the same time a quantity of lime, ready to absorb any silicic or phosphoric acid produced, the phosphorus might be and has been perfectly removed before the elimination of the carbon. Thus, at the Blaenavon Works, where Messrs. Thomas and Gilchrist made their first experiments in a stationary converter in which the tuyeres were certainly not more than a few inches from the surface of the metal, in almost every case the whole, or at least a very great proportion, of the phosphorus was eliminated by the time that the last portions of carbon were removed from the bath. The question might be asked, why the oxide of iron produced by surface oxidation is not reduced, remembering that the metal during the blowing process must necessarily be in a violent state of agitation, and therefore brought into intimate contact with the cinder formed at the surface. The explanation is very simple. When the phosphate of iron is formed at the top of the bath, it instantly afterward comes in contact with the highly-heated lime, which completely decomposes it, phosphate of iron and lime reacting on each other and forming phosphate of lime and free oxide of iron, and this phosphate of lime is incapable of reduction by the carbon in iron or by carbonic oxide gas. Hence no reduction takes place. From the point of the termination of blowing forward, the operations in the acid and basic processes are similar; only in the case of basic steel, the greater part of the surplus oxygen contained in the bath is removed by Mr. E. W. Richards's process of adding fluid hematite pig-iron containing silicon. To the blown metal is added spiegeleisen, by means of which the necessary carbon and manganese are put back into the metal (and by means of which, in the case of acidic steel, the surplus oxygen is also removed), which is thereby converted into malleable steel. The following are analyses of spiegeleisen:

	Old German.	New English.
Carbon.....	4·50 per cent.	5·20 per cent.
Manganese.....	10·00 "	20·00 "
Silicon.....	·50 "	·50 "
Sulphur.....	Trace	Trace
Phosphorus...	·10 "	·10 "

The reason why phosphorus can not be removed in the ordinary silica or acid converter is made perfectly clear by the following equations:

$$3CaO,P_2O_5 + 3SiO_2 = 3CaO,SiO_2 + P_2O_5$$
$$FeO,P_2O_5 + SiO_2 = FeO,SiO_2 + P_2O_5$$
$$P_2O_5 + 5Fe = 5FeO + P_2$$

These reactions show that phosphate of iron or lime, if found in the presence of silica, is decomposed, silicate of iron or lime being formed, and free phosphoric acid being produced. But this free phosphoric acid can not exist as such, but is reduced, not only by the carbon and silicon, but even by the metallic iron itself. If a rod of pure iron is simply dipped in phos

Digitized by Google

phoric acid, and heated to redness while in contact with it, a fusible drop of phosphide of iron forms at the extremity of the rod. Comparative analyses of the slags produced in the two processes are as follows:

	Ordinary slag.	Basic slag.
Protoxide of iron (FeO)	15·62 per cent.	9·13 per cent.
Peroxide " (Fe_2O_3)	1·57 "	.... "
Metallic iron (Fe)	.... "	.... "
Alumina (Al_2O_3)	1·02 "	2·10 "
Oxide of manganese (MnO)	5·33 "	4·32 "
Silica (SiO_2)	75·70 "	16·60 "
Lime (CaO)	0·94 "	47·08 "
Oxide of magnesia) MgO)	0·09 "	4·62 "
Sulphur (S)	0·01 "	0·12 "
Phosphoric Acid (P_2O_5)	Nil. "	16·03 "
Bases	14·57 per cent.	65·15 per cent.
Acids	75·71 "	34·85 "

A very great proportion of the present waste is due to projections from the nose of the vessel, which is liable to be carried away with the rubbish of the Bessemer house. An analysis of an accumulated mass of such projections yielded the following:

BESSEMER PROJECTIONS.

	Per cent.
Free iron (Fe)	70·30
Peroxide of iron (Fe_2O_3)	14·50
Manganese (Mn)	0·11
Carbon	1·01
Silicon	0·63
Sand	13·18
Phosphorus	0·05
Sulphur	0·06

According to careful analytical data, not more than 2 per cent of the metallic iron in the charge is actually burnt. If no loss occurs either in projections, scrap, or iron mechanically carried away entangled in the slag, the yield of steel should be 92·5 per cent of the metal charged. In practice, however, the yield averages from 3 to 4 per cent less than this. In the basic converter, the theoretical yield is about 2 per cent less than from the ordinary vessel; but in practice, owing to the large amount of slag produced, more particles of metallic iron are liable to be carried away with the slag, so that a yield of 85 per cent is considered very satisfactory. The comparative composition of basic steel and ordinary acidic steel is shown by the following analyses:

	Acid.	Basic.
Iron	98·33 per cent.	98·46 per cent.
Carbon	0·35 "	0.35 "
Manganese	1·11 "	1·01 "
Silicon	0·08 "	0·03 "
Sulphur	0·06 "	0·11 "
Phosphorus	0·05 "	0·04 "
Copper	0.02 "	Trace

From these it will be seen that the steel produced is very similar in both cases. The basic process is making rapid progress in a commercial sense, not so much in England (although there are several new works arranging for the process near completion) as on the continent. Mr. Gilchrist, one of the patentees, has recently estimated that the make of that steel last year every where was about half a million tons, and that the make of the forthcoming year will probably be double that quantity.

SOME CAUSES OF RED-SHORTNESS AND COLD-SHORTNESS IN IRON.*

By William Metcalf.

I do not propose to discuss the well-known red-shortness and cold-shortness of iron caused by sulphur and phosphorus respectively, nor the well-known effect of oxygen in producing red-shortness in steel. In fact, the latter is not altogether proved. For instance, in walking through an establishment with my partner, where some large steel ingots were worked, we noticed that the ingots were unevenly heated in a sharp oxidizing flame, and the corners were cracking badly and being chipped in every ingot. Upon calling attention to the matter, one of the gentlemen in charge replied, "Oh! that is not burnt; that's sulphur." As the gentleman had been in the business several months, we meekly closed our mouths. On the contrary, Mr. Park, who has been noted as a steel-maker for more than twenty years, charged all of the evils in steel to "wind," during a discussion before this society.

For the purpose of provoking a discussion, I have prepared a table, of analyses, showing some odd results. After explaining the table, I hope the members will explain the results.

	Siemens Direct.		Dupuy Direct.	United States Series.		Lucy.		Titan.	
	Iron.	Steel.		Mn.	Phos.	Pig.	Muck	Pig.	Bar.

				Mn. 1·5 Carbon low.	P. ·5 Carbon low.				

No. 1 is an analysis of some Siemens direct iron, made at the Black Diamond Steel-Works. The two tensiles given were obtained, the first from the iron once hammered and rolled, the second from the iron twice hammered and rolled. This iron was excessively red-short.

No. 2 is steel made from No. 1 with no addition to the iron except a little manganese, and whatever carbon the pot may have given it. This steel was not at all red-short; and you will observe, by the tenacity, that it was not cold-short.

No. 3 is some Dupuy direct iron. This was excessively red-short. Steel made from this iron of about ·90 carbon, was not only not red-short, but it was remarkably strong and fine—the record says, quite equal to Jessup's Best and Black Diamond, which we happened to be criticising about that time.

Nos. 4 and 5 are steels made for the United States Test Board.

No. 4 was an effort to produce a manganese steel containing 1·5 per cent of Mn and carbon very low. You see how well we succeeded. This steel was very hot-short, and very cold-short, and not at all red-short. This proves that the Bessemer men are all right when they go in for manganese and lively rail-rolling.

No. 5 was one of a phosphorus series we tried to make. In this case, we aimed at P ·500 and C low. We were not so wide of the mark this time. This steel hammered well at a good heat.

A piece $1\frac{1}{4}\times\frac{1}{8}$ inches could not be hardened, and although little flakes could be knocked off easily with a hand-hammer, the whole bar would bend cold to a right angle before fracture. It was not hot-short, nor cold-short to excess, notwithstanding an amount of phosphorus that, to say the least of it, was large.

No. 6 is Lucy Bessemer pig, and No. 7 is the resulting muck iron. These analyses will bear close inspection for their good qualities, and yet No. 7 was the most extremely red-short bar of iron I ever saw. It was for that reason that it was analyzed. As 2 per cent of cinder and from ·023 to ·025 of sulphur are quite common in good neutral muck iron, this is the case of red-shortness I wish to have explained. No. 8 is Titan charcoal pig, and No. 9 is the resulting muck iron rolled down to $2\frac{1}{2}\times\frac{1}{4}$. This muck iron was very clean, granular, and highly lustrous in the fracture. It worked perfectly under the hammer, from welding to red heat. It looked hard, and I first thought it was a sort of puddled steel; but it proved to be dead soft; the more it was heated almost white and quenched, the softer it seemed to be. This bar was so cold-short that a piece a few inches long could be held in the fingers and crumbled to pieces on the anvil by light blows of a hand-hammer. It was for this reason that it was analyzed, in a search for the cause of the cold-shortness.

*Paper read before the Engineers' Society of Western Pennsylvania, March 16th, 1883.

PROGRESS IN SCIENCE AND THE ARTS.

An Electric Thermometer.—M. Becquerel has been engaged during the winter in experiments, the object of which was to ascertain whether snow had the effect of protecting the ground from frost. In carrying out these experiments, he pressed electricity into his service in a most ingenious manner. Before describing his apparatus, we may, however, state that the result of his experiments was as follows: That a covering of snow does not protect the soil and seed from freezing, but only hinders to a certain degree the too extensive radiation of heat from the soil, and is converted into water at 32 degrees, which sinks into the earth and somewhat raises its temperature. Also, that a heavy sod does more to protect the soil and raise its temperature than ever so thick a layer of snow. The experiments were carried out in the Jardin des Plantes, Paris, and in the following manner: Two covered wires of unlike metals—copper and iron—were soldered together at both ends, which were left uncovered for this purpose; otherwise they were covered their whole length, for the purpose of insulation, with gutta-percha and silk. On the soldered ends of these double wires being exposed to different temperatures, a current is generated in them, and the greater the difference in temperatures, the stronger the current; but the current ceases when both are exposed to the same temperature. This electric current was caused to act on a magnetic needle suspended so as to move freely over a graduated circle. The copper wire formed a vertical frame around the needle parallel to its normal direction. As long as both ends of the double wire are at the same temperature, the needle continues to point to the north, being subject only to the earth's magnetism; but as soon as there is any variation in temperature, the needle is sure to move instantly and take another position, which it will keep until some other change of temperature takes place. The application of this apparatus to the measurement of soil temperatures was made as follows: One of the soldered joints was buried in the earth to a depth at which it was desired to take the temperature, and the other end was put in a water-bath at any desired distance from the first. The temperature of the latter could be increased or diminished at pleasure, and was measured by a very sensitive thermometer. To ascertain the temperature in the soil where the other end was buried, is was only necessary to raise or lower the temperature of the water-bath until the magnetic needle stood at zero, and then read the thermometer.

FURNACE, MILL, AND FACTORY.

The Lancaster Manufacturing Company has been organized under the laws of the State of New York, with a capital stock of $250,000. The officers of the company are: James H. Lancaster, President; John Pickering, Treasurer and John Q. Maynard, Secretary. The facilities for manufacturing the Lancaster tools will now be considerably increased. The company has acquired the sole right to manufacture and sell in the United States and Canada the patented inventions of James H. Lancaster, consisting of stocks, dies, and adjustable pipe-guides; twin pipe-cutters with burr-scrapers; combined pipe and nut-wrench; combined pipe-cutter, wrench, and burr-scraper; combined punch, shear, wire-cutter, and anvil; pipe inside burr-reamers. Other improved tools will be added to this list from time to time.

The Hartman Steel Company, of Beaver Falls, Pa., has started a portion of the machinery in its new wire mill, and, according to present accounts, it is working very satisfactorily. The company has just placed contracts for its merchant steel and rod trains.

A new rolling-mill is in course of construction at Toledo, Ohio, by a company known as the Maumee Rolling-Mill Company, with $500,000 capital. H. S. Walbridge is President; I. Droege, Vice-President and General Manager; H. S. Worthington, Treasurer; E. H. Van Hoesen, Secretary. It expects to be in operation by the end of the year.

Forty rollers and heaters employed in the pudding-mill of the E. & G. Brooke Iron Company, at Birdsboro', have stopped work on account of a reduction in their wages ranging from 11 to 12½ per cent.

The St. Louis Ore and Steel Company, owner of the Vulcan Iron-Works, has taught the members in that city of the Amalgamated Association of Iron and Steel Workers a lesson. The result of it all will be the dissolution of the latter, as far as St. Louis is concerned. When the Vulcan, some time ago, announced a

Digitized by Google

reduction of wages to these high-priced workmen, but not to others, they promptly struck and quit work. The company put new men on, and after a little time taught them their work. The company will not now employ union men on any terms.

It is expected that, at the meeting of stockholders of the Union Iron and Steel Company on April 14th, the announcement will be made that sufficient capital has been obtained to enable the company to reopen the mills. A creditors' meeting will be called soon after the stockholders' meeting, and those most interested believe that at that time the difficulties will all be settled. It is known that the company has a very large stock of pig-iron and ore on hand ; that the works are in excellent condition ; and that there are contracts holding good for a heavy output of rails.

The rebuilding of the Grasshopper mill at Youngstown, Ohio, and erection of all the machinery, have been completed, and it is running full time. With their mill, the Arms, Bell & Co. have more than sufficient capacity to roll the iron needed to supply all the nut and bolt machines operated by the company in both its establishments.

The Coosa Furnace Company has begun operations at Gadsden, Ala., on the Coosa River, and is building a 12-foot furnace. It is equipped with iron stoves, and is now about completed. This is an old furnace, that has been moved here from Terre Haute, Indiana. The intention is to use charcoal, but the furnace will first be put in blast with coke, which will be procured on the line of the Cincinnati Southern Railroad.

The Vesta Furnace, near Marietta, Lancaster County, Pa., owned and operated by Watts, Twells & Co. Limited, has had a most exceptionally good blast since December, 1881, when it was blown in; not a day's yield of iron has been lost, and it has turned out regularly nearly 1000 tons per month, not ten tons of which were under grade of No. 3. This furnace has now a most enviable reputation for the superior quality of the iron, both for mill and foundry use. Henry M. Watts & Son are making arrangements to put their Marietta furnace No. 1 in blast.

A sale has been closed for one of the heaviest rock-breakers ever built. It was a Buchanan, weighing 60,000 pounds, and was bought by the Park Commissioners.

Messrs. John A. Roebling, Sons & Co., recently sent from Trenton, N. J., to San Francisco, a wire rope, 1⅛ inches in diameter and over four miles long. It is for a cable street railroad in San Francisco, and it is asserted that it is the longest and heaviest rope wire ever made in the United States. The rope weighed about twenty-five tons, and was loaded on two flat cars, secured together by chains, in addition to the usual coupling.

The Cummer Engine Company, Cleveland, Ohio, is now fairly under way in all departments, and its present capacity is crowded to its fullest extent to fill the orders. The company employs about 175 men, and will gradually increase its force to 300 men, the full capacity of its present plant. The factory, when completed and equipped, will consist of two molding-rooms, 360 by 80 feet, and a machine-shop 400 by 60 feet, two stories. Altogether the buildings and grounds will be 400 by 350 feet, and accommodate 500 workmen.

There is a strike among the puddlers and helpers at the Pencoyd Iron-Works, West Manayunk, Pa., owing to the attempt of the company to reduce the scale of wages from $4.25 per ton to $3.75.

At Shawnee, Ohio, the New York is doing nothing, and the XX is doing next to nothing. The Mauley is loading from four to six cars a day. The Shawnee Coal and Iron Company has shipped 8000 tons more coal during the past three months than during the corresponding period of 1882. The Fanny furnace has been operating one stack very successfully since the February rains, which supplied the needed water.

The Columbus & Hocking Coal and Iron Company, at Columbus, Ohio, with its fifteen mines, seven furnaces, and ten stores, is just closing the first month's operations under the new *régime*. Only three of the furnaces have been in operation ; but these are now very busy in filling the company's orders. The coal trade has of course been light ; but Mr. Longstreth, who has charge of the coal department, and Mr. Crafts, the superintendent of the iron department, are each looking into and systematizing the details of their respective departments, in order to be in good shape for business when the lake season opens.

The Hercules Iron-Works, of Chicago, have just shipped to the Streator, Ill., coal mines two of the Murphy Champion ventilators.

The Chicago Rawhide Manufacturing Company's goods are becoming widely known. On the 14th of March, it shipped a large invoice of its rawhide leather belting to Sydney, Australia.

MINERAL PATENTS GRANTED BY THE UNITED STATES LAND-OFFICE.

The following patents were issued by the General Land-Office under date of April 1st, 1883 :

ARIZONA.

TUCSON DISTRICT.

Marshall Blinn, Shorty and Ecstasy lodes.

CALIFORNIA.

HUMBOLDT DISTRICT.

Stone Lagoon Gold Mining Company, placer.

MARYSVILLE DISTRICT.

John Stokes, placer. Isaac W. Kitchen, Carlton placer. William Hooper, Sand Bluff gravel placer.

SACRAMENTO DISTRICT.

George E. Williams, Long quartz mines. James O. Groves, Groves gold quartz mine. Philip Molter, Mammoth placer. S. C. Farnham, Farnham gold quartz mine.

SAN FRANCISCO DISTRICT.

Samuel Schwartz, El Devisadero lode. Nathan Goldtree, El Salto mine.

STOCKTON DISTRICT.

William H. Guion, Bonita quartz mine and mill-site.

SUSANVILLE DISTRICT.

G. W. Meylert *et al.*, Nigger Gulch placer mine.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY—TOMBSTONE DISTRICT.

LIMA CONSOLIDATED.—This company owns three locations, the Green Cloud, the Lima, and a fragment called the Old Necomis. Considerable work has been done on the two former claims. The shaft has attained a depth of 265 feet, and is sunk on the ledge. This ledge has the very same direction as the Grand Central and Contention mines, nearly north and south. Four levels have been started, at 85, 135, 190, and 250 feet, from each of which drifts have been run in on the ledge, that on the 135-foot level being run 60 feet north and the same distance south. The ledge from the surface down shows good and strong, and, as depth is attained, widens out, until, at the 250-foot level, it is five feet in width. From the bottom of the shaft, ore was hoisted, and from the north drift, 250-foot level. The ore, which is mixed with a good percentage of manganese, contains chloride and horn-silver, and a fair average of the ledge may be put at $35, while with a little sorting, an average of $80 is obtained.

GRAHAM COUNTY.

COPPER KING.—This company owns five claims, which are named Union No. 1, Union No. 2, New England, Montezuma, and Arizona Boy. Union No. 2 has had considerable work done on it. An open cut 68 feet long and 30 feet deep has been made on the vein. The ore is copper glance, and gives good assays. Six hundred tons of ore are now on the dump, taken from this cut. This claim has also a tunnel 30 feet long, showing good indications. But little work has been done on the other claims except on the New England. On that, a shaft has been sunk near the vein 40 feet, which will drift to the vein. About two tons of high-grade ore, carrying considerable native copper, were taken from the surface. The vein is from 25 to 30 feet in width, and is considered the mother lode. These properties are about two miles from Oro, and five miles from Clifton in a northerly direction. A force of men will soon be put to work to develop them. The vein on which Nos. 1 and 2 are situated has claims located on it 23,000 feet.

CALIFORNIA.

CALAVERAS COUNTY.

HOOSIER CONSOLIDATED.—The Calaveras *Chronicle* states that this company own the Mary Lory, the Way Ground, and the Hoosier. Four tunnels have been run at intervals along the course of the lead, besides prospecting-shafts, in all of which were found good rock and the indications of the existence of a true fissure-vein. The rock from three of the tunnels which were run several years since, was conveyed with great difficulty and expense a long distance to the river below, where it was worked by the arrastra process. Prior to the erection of the mill, the rock on the old dump was thoroughly prospected, with a view of getting as nearly as possible a correct estimate of the value of the rock. According to the results, the estimate was placed at the lowest—$5 per ton. The rock was not selected, but taken just as it came from various parts of the dump. With this estimate, it was calculated that the rock in sight, which is in quantities to last several years of milling, could be worked with a fair compensation, together with very flattering prospects in the development of the mine. A tramway 118 rods in length, with a grade of one foot to the rod, was constructed, reaching from the Hoosier tunnel to a point above the mill, by which it is connected with another tramway, 300 feet in length, directly down the hillside, which slopes at an angle of about 45 degrees. The first run of 75 tons of the ore from the old dumps exceeded the estimate made, and yielded $7 per ton. The indications are, that the present run will equal if not exceed that figure. The cost of milling the rock does not exceed $2.50 per ton. But ten stamps have been put up for the present, but the frame-work was constructed so as to permit the addition of ten stamps more. The mill is run by a hurdy-gurdy water-wheel, the necessary pressure being easily obtained by a ditch tapping the Calaveras River a comparatively short distance above, and supplying free water for running and all other mill purposes.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended March 24th shows : Tons of ore crushed, 156·78 ; average assay value of pulp, $86.54 per ton ; of tailings, $4.32. East cross-cut, 1000 level, was driven 12 feet. The flow of water has lessened a little, so that the pumps are running at the rate of about 7¾ strokes a minute. The north drift, 800 level, is 307 feet long. South drift, 770 level, is 78 feet long. From the north drift, 700 level, a rise, No. 22, has been made on the Fortuna, and this is now 37 feet long, as measured on the dip of the vein. The north drift from winze No. 6, 672 level, is now in 40 feet.

BULWER CONSOLIDATED.—The west cross-cut from the north drift, 700-foot level, has been advanced during the week 11 feet ; total length, 115 feet. The face is still in hard blasting ground.

STANDARD CONSOLIDATED.—The official report for the week ended March 24th shows : Tons of ore shipped to mills, 1291. West cross-cut, 1000 level, is in 1285 feet. South drift, from east cross-cut, 700 level, is in 592 feet, and shows 2½ feet of vein. West cross-cut from south drift is 115 feet long, and is in hard blasting rock. North drift No. 1, 500 level, is in 588 feet, where the vein is about 12 feet wide. North drift from south uprise No. 1 is 111 feet long, and the vein

Digitized by Google

is 6 feet wide. South drift No. 2, 385 level, is in 379 feet, and shows the vein 6 feet wide. The stopes are looking well.

SAN BERNARDINO COUNTY—PROVIDENCE DISTRICT.

Rich discoveries have been recently made, and the prospects promise a most prosperous future for this district.

BONANZA KING.—The reports from this mine continue to be favorable.

TROJAN.—Work has been begun on this mine, an adjoining property of the Bonanza King.

CANADA.

PROVINCE OF MANITOBA.

The Winnipeg *Mining Index* reports as follows:

BRITISH AMERICAN.—This company has recently been organized to carry on operations in Keewatin District. The capital stock is $500,000, divided into 50,000 shares of $10 each. The company will develop a location situated about a mile and a half from Rosslyn station and eleven miles from Rat Portage. The vein is a strong one, carrying a reddish quartz showing copper and iron pyrites. The surface yield is fair. Nothing much will be done at present beyond getting out timber and erecting buildings; but when the snow leaves, sinking will begin.

KEEWATIN.—A rich body of ore was recently struck. Work has been going on steadily.

LAKE WINNIPEG.—This company is working a location near Big Island, on the east shore of the lake, with very promising results. The vein is a large one, and assays very well in both gold and silver. The shaft has attained a depth of twenty-five feet.

SASKATCHEWAN.—This company was formed to dredge for and wash the auriferous sands of the river Saskatchewan. It has not been able to begin operations yet on account of the ice; but the company has purchased the necessary machinery, and every thing is in readiness to start as soon as the river is clear. Dredging and sluicing were tried unsuccessfully some little time ago, although the failure was more on account of having very primitive machinery than a lack of the precious metal, as, during the one day in which the machine did work, about $84 worth of gold was saved at very little expense.

WINNIPEG CONSOLIDATED.—The vein has been increased by another feeder from the hanging-wall, and the bottom of the shaft looks well. Over 200 tons of quartz are on the dump ready for milling, and work on the mill is pushed vigorously.

COLORADO.

CLEAR CREEK COUNTY.

A dispatch from Idaho Springs to the Denver *Republican* says that large blocks of copper ore, carrying native copper, have been discovered near the Old Chief, on Soda Creek.

PAY ROCK.—It is expected that the new concentrator will start by the middle of April.

POLAR STAR.—The water that heretofore proved so troublesome is under control. An engine and pump to clean the 128-foot shaft from the lower level are fitting up. The 65-foot shaft at the mouth of this level is going down steadily under the contract with J. Thomas & Co. A drift east has been started sixty feet down.

SEVEN-THIRTY.—The mineral continues of good quality in the 310-foot level west. Six tons milled assayed 125, 135, and 350 ounces per ton according to class, the whole lot averaging $147.83 per ton. The breast of the 310-foot level east shows three feet of solid mineral. The main shaft is sinking day and night, and is down about 60 feet below the 310-foot level. The mineral continues in it all the way down, and is apparently improving in quality. The last run from No. 2 west brought 334 ounces per ton.

DOLORES COUNTY.

Mr. Linwood O. Towne, of Rico, under date of March 28th, sends us the following notes:

GARFIELD.—In this mine, situated up Horse Gulch, a most encouraging strike of fine gold-bearing quartz has just been made. Work has been steadily going on at this property all winter. There is a well-defined vein from which come specimens assaying as high as 152 ounces in gold, with some silver.

NEWMAN GROUP.—Work is rapidly pushed by the leaser, Mr. Frederick Reed. Some of the richest ore ever taken from the group, showing wire silver, has recently been obtained in quantity from the Swansea, and shipped to the Grand View smelter.

GRAND COUNTY.

PIONEER.—Some excitement was occasioned the other day by a rich strike in the Toponis mine, the property of this company. From eighteen inches to two feet of mineral were uncovered, and the ore has every appearance of being high-grade, carrying gray and yellow copper and a very fine galena. Six men are steadily employed at the mine, and the pay-streak continues to increase in width.

WOLVERINE.—The company has decided to build at the Gaskill mine.

GUNNISON COUNTY.

NATIVE SILVER NO. 2.—A strike of Ruby and brittle silver was made in this lode, near what is called Mineral Ranch, four miles from camp. The vein is several feet wide, and has a streak of ore which will run from 1000 ounces up. The ore, on being roasted, is literally covered with globules of silver. The vein is in the solid formation.

SILENT FRIEND.—In the north drift of the ninety-foot level of the mine, a cave was opened which proved to be 225 feet deep and from three to fifteen feet wide. It has been explored, and its walls are found to be all mineral galena and lead carbonates, and it is estimated there is $50,000 worth of ore lying loose at the bottom, which has fallen from the sides and roof. The company will immediately arrange to hoist the loose boulders, which are mostly carbonates.

TERRIBLE.—This mine has been sold to J. S. Lawrence, of the Gunnison First National Bank, for $80,000 cash.

HINSDALE COUNTY.

CROOKE'S SMELTING-WORKS.—The works have not been making full time lately, owing in part to short water supply, and in part to the fact that little or no stoping has been done at the mine, the concentrator chiefly treating the dumps, which do not yield sufficient to supply the roasters. The seventh level of the Ulé mine, which is the property of this company, is running northeast and southwest from No. 2 shaft, and is about 25 feet on each side. Winzes are sinking which show about the usual body and character of ore. Stoping is also going on in the Ute, but no new ground has been opened as yet. The company is considering the subject of putting up an elevated tramway, to run the ore from the mine to the concentrator. We are informed that the announcement that contracts have been let and tram ordered is premature, although there is little doubt that the directors will favorably consider the matter.

LAKE COUNTY.

Late Leadville exchanges contain the following:

BROOKLAND.—Work has been resumed on this property after putting in a new plant of machinery. The work of development will be pushed and shipments begun shortly.

CHRYSOLITE.—The new sampling-works will be in operation shortly. In the mean time, the mine is worked unobtrusively, but with a generally satisfactory result. Four leases are running on various parts of the property. First, the Marden lease, which covers the burnt district in the old Carboniferous, Chrysolite, and Vulture claims. This lease, without proving an absolute bonanza, has paid very fairly. The lessees have shipped nearly an average of 90 tons a week, by gleaning where the miners had gone before them, and must have realized several hundred dollars each a month. Secondly, the Ayres lease, which includes the old workings on the Muldoon, and parts of the Pandora and Vulture. These lessees have as yet shipped no ore. Thirdly, the Webb lease, which is on part of the Vulture, and the old Eaton workings. The lessees have been very fortunate. They have shipped about 50 tons of ore per week, and must have realized several thousand dollars. Fourthly, the Church lease, which is on the Colorado Chief No. 1, and the edge of the Pandora. The lessees have as yet shipped no ore, although they have a considerable quantity in the ore-bins. From these four leases, the company is realizing about $5000 a month. Two of them run out in October, and the other two in February next. Simultaneously, Manager Clark is doing a little mining on company account, which nets enough to pay the current expenses of the mine, including the cost of driving the new incline on Colorado Chief No. 2—say $11,000 a month. The prospects of the company depend largely on the completion of this incline.

LITTLE ELLEN.—This mine, the property of the American Smelting Company, is steadily worked. The property is developed by an incline, which has reached a depth of 750 feet. The company intends to put a new plant of machinery on this incline, and has ordered a large double hoister, engine, and boiler. The property is doing well, and the new strike which is reported to have been made in the adjoining Trade Dollar, which belongs to the company, will add materially to its value.

MIKE & STARR.—Work has been started up, and sinking is vigorously prosecuted. A winze forty feet in depth has been sunk in the main level, from which a cross-cut is run thirty-five feet—striking a body of mineral seven feet in thickness. The ore, as in the past, is refractory, but sample assays have been made which returned from sixty to seventy ounces silver and from fifteen to twenty per cent copper. A three-inch drill is worked in the bottom of the main shaft, and is sinking at the rate of eight feet per day. It has passed through twenty feet of white quartz, and is still in the same matter.

NEW PITTSBURG.—During the past month, the territory in the neighborhood of the Lent shaft has been developed, and with very gratifying results. From this shaft, a drift has been run in a northwesterly direction about eighty feet. From about this point, a drift has been run a short distance to the north, developing three feet of good ore. In a west drift from near the same point, two feet of ore have also been opened up. About a foot of ore has also been shown up in a drift almost due north from the shaft. The ore recently discovered assays from 25 to 90 ounces in silver, and will average about 30 ounces in silver and forty per cent in lead, making it an excellent smelting grade. During the month, about three hundred tons of ore and iron have been shipped, and regular shipments from the new ore-bodies will begin on the first of April.

SUMMIT COUNTY.

ROBINSON CONSOLIDATED.—Mr. Greer's lease, which runs to March, 1884, is very elaborate, and the royalty varies from 30 to 60 per cent, according to the grade of the ore, and its location in the mine. The mine is now shipping about 20 or 25 tons a day of ore from the new ore-body, which is opening by the incline from the winze on the twelfth level, and is looking better daily. The ore averages about thirty ounces.

TEN MILE DISTRICT.

THE MAXIMUS AND BERNADOTTE.—The Leadville *Herald* reports as follows: Among the mines which have lately come to the front on Fletcher Mountain, Ten Mile, are the Maximus and Bernadotte, owned by the Colorado Land and Mineral Company. It has been reported that a rich strike was recently made in this property, and on calling on the manager, it was learned that such was the case. The Maximus is developed by two tunnels. Tunnel No. 1 has been driven 200 feet, with cross-cut to the north, which is in ore. Tunnel No. 2 is in a distance of 120 feet, and has exposed some very high-grade ore. From the No. 1 tunnel, at a distance of 85 feet from the mouth, a cross-cut has been run west fifty feet, cutting the Bernadotte vein, running parallel to the Maximus vein, and a drift has been run on the vein for a distance of 130 feet to where the important strike was made. The vein in the breast of the tunnel shows about three feet of high-grade ore. No ore can be shipped at present, and what is extracted in development-work is stacked up until the shipping season opens. The property is well arranged for working, with iron tracks in the tunnels, and other conveniences, and from the amount of ore yielded by the development-work alone, it is evident that it will make a good producer as soon as it is sufficiently opened up, and the shipments are begun.

DAKOTA.

A dispatch from Deadwood to the New-York *Tribune* says that new or additional works are projected as follows: Homestake Company, 200-stamp mill; Trojan Company, 100-stamp mill; Lancaster, 100-stamp mill; Caledonia, additional 40 stamps to its present 60-stamp mill; Golden Summit, 20 additional stamps; Florence silver mill, 20 additional stamps; Oro Fino, hoisting-works and 20 additional stamps; and a patent concentrator for Silver Creek property owned by a La Crosse company now organizing. In addition, there is talk of purchasing the Standby 60-stamp mill and connecting it by a narrow-gauge railroad with the Minnesota, five miles distant; of large reduction-works by the King Solomon Company; a mill for the Bengal Tiger; another for certain Box Elder property owned by a company now organizing in New York; and still another by the Berkshire Company. These latter, however, are not fully assured.

FATHER DE SMET.—The superintendent writes under date of March 19th as follows: Herewith express company's receipt for bar No. 155, 886·60 ounces gold, the result of run of mill for first half of March. On the 15th inst., I drew on Laidlaw & Co., for $18,000, which amount was for all February expenses. The north end tunnel is progressing slowly—only four men at work. I have no word of encouragement for this portion of the mine. On the second level, I have started a cross-cut west from Cook's chamber, which is now in ore, after passing through about 12 feet of slate. The third level header has not yet connected with the Italian winze, lacking about 8 feet of surveyed distance. Face of header in very poor material. The prospects for a large body of ore back of face of header and to the east of header are very good indeed. The rise from west cross-cut tramway level is progressing very slowly in very low-grade ore. In fact, I need not tell you that all our ore is very low grade; but there are large bodies of it, and by economical working we shall continue to make some money for a number of years at least.

NIGGER HILL.—This company has resumed word on its 40-mile ditch, and expects to have every thing in readiness for hydraulicking by July 1st.

PORTLAND.—The company's mill, Bald Mountain, is now repairing, and the stamps will drop in about two weeks. The company's property has been idle for a long time, although it is considered valuable by all familiar with it.

SUMMIT.—The first clean-up of the mill (thirteen days' run) amounted to $3600, or about $25 a ton.

GEORGIA.

COLUMBIA.—The grading is finished, together with all the trestling. A reservoir has been completed this week, and another is digging. The lumber for building the flume is mostly on the line, and building already begun. It is expected that the mill will commence work by the 1st of May.

FISH TRAP.—Work has been resumed at this mine.

Digitized by Google

IDAHO.

BLACKBURN MINING DISTRICT.

A correspondent of the Salt Lake *Tribune* states that this district promises to become a lively place this season. It is located on Little Lost River, seventy miles northwest of Blackfoot, and can also be reached from Camas Station, on the Utah & Northern, the distance being between sixty and seventy miles. Assays made of four lots of ore of the Ingersoll mine show results as follows: No. 1 went 18 per cent copper and 1570 ounces silver; No. 2, 189·58 ounces silver; No. 3, 157·76 ounces; and No. 4, 174·98 ounces.

The Daisy Black claim has developed so well that a smelter is to be built this spring to reduce the ores of this property, and also of the Great Northern.

The Tyndall is located on the Tyndall lode, which has been prospected between five and six miles. This great lode varies in width from 25 to 100 feet on the surface, and the outcroppings are well defined the entire distance prospected. Nine tons of ore from there were sold in this city at $118 per ton. The lay of the country, its excellent supply of water and timber, and its location in a country having good grazing lands, makes the district a desirable one, and it is attracting much interest among prospectors and mining men.

SAWTOOTH.—The stockholders, at a meeting in Ogden recently, elected the following officers: M. H. Beardsley, President; W. P. P. St. Clair, Vice-President; J. M. Langsdorf, Treasurer; A. C. Emerson, Secretary. The following gentlemen were elected directors for the ensuing year: Messrs. J. W. McNutt, J. W. Millis, W. H. Broadhead, W. Callahan, M. Buckmiller, F. A. Hall, R. J. Hill, William Van Dyke, and P. H. Emerson. The financial affairs of the company were found to be in good condition, and it was determined to prosecute development with renewed vigor.

MAINE.

CHERRYFIELD.—Work at this mine has been suspended.

STEWART.—The new machinery is all in place, and work has started up. The new pump is set seventy feet from the surface, and does excellent work. Good progress will now be made in sinking and drifting, as the plant is complete, and every piece of machinery is of the very best workmanship.

MEXICO.

The Pachuca courts have decided that the by-laws of a mining company are binding on stockholders, irrespective of the State code of mining laws.

BATOPILAS.—The new lixiviation-works have been completed. Rich silver was recently struck in an old working of the Veta Grande vein lately cleaned out. Some of the silver is nearly pure, and the vein has yielded steadily ever since. Eighty feet above a tunnel, another chute has just struck what seems to be a new chimney of silver, and the ore is very rich. Rails, etc., have arrived, and will be laid at once to connect the company's San Pedro and Martinez mines with the large reduction-works. This will enable it to deliver large quantities of ore to the mill, and much of the ore yields 200 ounces per ton. Another of the company's mines, the Giral, is giving large amounts of low-grade ores, running from 50 to 75 ounces per ton. The thirty additional stamps have arrived, and will be in operation by the end of May.

GUADALUPE.—The reduction-works at Pachuca are to be started in about a fortnight.

SANTA GERTRUDIS.—This mine has been thoroughly inspected by the members of the commission appointed at the last general meeting, and they are perfectly satisfied with the prospects of the mine. The various points show an abundance of high-grade mineral, and no cause is apparent for the suspension of dividends, so far as the production of the mine is concerned.

MICHIGAN.

A find of copper ore was made recently north of Ishpeming. The discovery is testing as regards its extent. It is very rich in copper, though the deposit is thought to be but a small pocket.

DEER LAKE.—The company is supplying its furnace with flux from the limestone deposit on the lands of the Ropes Gold and Silver Company. This flux gives better results than any other yet tried by this company, and its close proximity to its works enables it to procure it more cheaply than it could get it from any outside source.

ROPES.—The shaft has attained a depth of thirteen feet. At the bottom of this shaft, the quartz vein proper measures exactly 45 inches, having increased four inches in width from surface. The quartz is a white crystalline, heavily charged with mineral, and shows a large amount of native gold and silver. The whole width of the vein carries gold and silver, and is not confined to a streak of a few inches, as is often the case in gold-bearing rock, though the usual characteristic of being richest along the "hanging," is apparently the case here. The vein casing, which is of slate, shows a large amount of mineral, the first few inches on each side of the lode appearing as rich as the quartz.

MONTANA.

The mining operations of the past week, says the Butte *Miner*, may be characterized as active. While several smaller mines were shut down for repairs and the Dexter mill stopped for a clean-up and general overhauling of machinery, the principal mines and mills, like the Moulton, Alice, Lexington, Silver Bow, and Shonbar, were running with their accustomed regularity and producing their regular output.

NEVADA.

ALBION.—The Eureka *Sentinel* states that a strenuous effort has been made to get all the attaching creditors of the Albion to sign the agreement, which has already been much discussed, and by which the miners, laborers, and mechanics would receive money for their wages and the mine be opened for work. The only signature lacking to complete the list was that of Tredennick, who declined all overtures to join the other creditors in their action under the proposed agreement. The presumption is, that this renders impossible the settlement that has been looked forward to with so much confidence. If an agreement can be had, the men will be paid off immediately, as the money is already here and in hand for that purpose.

MARTIN WHITE.—The superintendent's letter states that the ore discovered near the old Black chamber does not continue to look so well. The ground is still favorable for ore, and another cut or two may bring it in as strong as ever again. There is no particular change to report from the F. F. The west drift shows some improvement, and there is some very good ore coming in at the extreme west end, and appears to be going down toward the east.

NAVAJO.—The official report of March 22d shows: Total depth of shaft, 510 feet; progress since last report, 10 feet; cut a small seam of ore; no material change to note in the formation. Drift south, 350 level, advanced 19 feet; total length, 186 feet. The face shows a large width of vein-matter, yielding low assays, and altogether looking favorable. No material change in south drift, 450 level. The stopes are looking well at all points. Average battery assays of ore milled during the week, $285.62 per ton. Mill was closed down two and a quarter days, to make some necessary repairs.

NEW MEXICO.

There is a mineral belt lying northeast and east of Albuquerque, beginning with the Cerillos Mining District and running southwestwardly to the mouth or western outlet of the Tijeras Cañon, which is for the second time beginning to attract a measure of attention in some degree commensurate with the extent and richness of the deposits of valuable minerals there found. For some twenty miles south of the town of Cerillos, those deposits are largely of gold and coal. Of coal there are immense beds, both hard and soft, much of it suitable for coking, and all of it of excellent quality, the depth of the beds varying from three to seven feet, and averaging fully four feet.

SAN PEDRO & CAÑON DEL AGUA.—In 1880, the Crescent Company began operations, and since then two new tunnels have been run and some 6000 feet of chambers and leads excavated. The vein is now known to be 36 feet in thickness, and it has been traced for two miles in the face of the mountain. While it is known distinctively as a copper mine, some portions of it also carry considerable gold, sufficient to pay for working. The ores are known as carbonates and sulphides. Sixty men are regularly employed at the mine, taking out ore and doing development-work. The smelting-works consist of a large building about 60 by 200 feet, containing two smelters with a capacity of thirty tons each; twenty-five stamp-mill, or crushers, including two Blake crushers and one Cornish roller; two engines of eight horse-power each; an upright eighth engine of eighty horse-power for the stamp-mills; two blowers, No. 5½, Wilbraham make.

UTAH.

According to the Salt Lake *Tribune*, the Reed & Benson tunnel, begun six or seven years ago, is now in 2039 feet, and has evidently entered the peculiar limestone formation which produces, or in which is found, the Emma ore-bodies. The tunnel is as straight as an arrow, of grade sufficient so that a car will run out by gravity It is 1200 feet, vertical, below the croppings, and there are 500 feet, vertical, of virgin ground above it. At one time, the rock was so hard that it required five months to excavate 100 lineal feet of this tunnel. The same force now excavates 81 lineal feet in a month. There was ore of the usual high grade of this mine in four places in the bottom of the old workings, and it is of course anticipated that this same ore will be found to extend from those localities to the tunnel level and below. When Mr. F. C. Reed took charge of the work, he extracted, with 40 men, 1000 tons of ore in one winter, working from the top. The next winter he took out 900 tons, with six men, in the same time, working through a Reed & Benson opening to the surface lower down. He anticipates taking out ore, whenever he cuts it, for comparatively nothing. The tunnel has cost all the way from $4 to $21 per foot.

PATENTS GRANTED BY THE UNITED STATES PATENT-OFFICE.

GRANTED MARCH 6TH, 1883.

273,275. Amalgamating-Furnace. William E. Harris, New York City.
273,299. Steam-Boiler and other Furnaces. Orel D. Orvis, New York City.
273,300. Magnetic Ore-Separator. John Rae, New York City.
273,311. Blast-Furnace Plant. Jacob Reese, Pittsburg, Pa.
273,354. Brick-Kiln. John E. Gamble, East Liverpool, O.
273,367. Apparatus for Returning and Feeding Water to Boilers. Timothy J. Kieley, New York City.
273,397. Hydraulic Mining Machine. Jay E. Russell, San Francisco, Cal.
273,409. Drilling-Machine. Franz Voos, Solingen, Prussia, Germany.
273,421. Steam-Boiler Furnace. John Abell, Woodbridge, Ontario, Can.
273,477. Ore and Rock-Crusher. Miles B. Dodge, San Francisco, Cal.
273,478. Rock-Crusher. Miles B. Dodge, San Francisco, Cal.
273,583. Ore-Separator. Hiram P. Minot, Columbus, O., Assignor to Chester Minot, same place, and Samuel Watson, Cambridge City, Ind.
273,623. Method of and Apparatus for Making and Raising Salt-Brine from Deep Veins. George H. Smith, New York City.
273,661. Gas Combining and Heating Block for Furnace Bridge-Walls, etc. Robert R. Zell, Baltimore, Md.
273,662. Apparatus for Amalgamating and Concentrating Ores. John Alves, Dunedin, New Zealand.
273,679. Apparatus for Generating and Carbonating Hydrogen Gas. Leroy S. Groves, Afton, Iowa, Assignor of one half to John W. Shute, same place.

GRANTED MARCH 13TH.

273,703. Machinery for Separating the Ores of the Precious Metals. Thomas P. Benton, La Crosse, Wis.
273,742. Blast-Furnace. William Kent, Alleghany, Pa., Assignor of one half to John Scott, Jersey City, N. J.
273,775. Dry Amalgamator. Isaac Stead, Philadelphia, Pa.
273,799. Furnace for Effecting the Protection of Iron and Steel Surfaces. Frederick S. Barff, Kilburn, County of Middlesex, and George Bower and Anthony S. Bower, St. Neats, County of Huntingdon, England; said Barff Assignor to said George and Anthony S. Bower.
273,840. Copper-Smelting Furnace. John B. F. Herreshoff, Brooklyn, N. Y., Assignor to himself and George H. Nichols and William H. Nichols, both of New York City.
273,917. Manufacture of Furnace Linings. Herman Ulsmann, Konigshütte, Prussia, Germany, Assignor to Edward Cooper, New York City.
273,965. Pumping System for Surface-Condensers. Charles W. Copeland, Brooklyn, N. Y.
273,969. Machine for Amalgamating and Concentrating Ores. George Dean, St. Louis, Mo.
274,035. Rock-Drill. Richard V. Rogers and James M. Allen, Larkinsville, Ala.
274,050. Pulverizing-Machine. Stephen P. M. Tasker, Philadelphia, Pa.
274,051. Hopper for Pulverizing-Machines. Stephen P. M. Tasker, Philadelphia, Pa.
274,055. Bessemer Converter. Sidney Gilchrist Thomas, Tedworth Square, County of Middlesex, England.
274,083. Apparatus for Separating Gold. John A. Cable, St. Louis, Mo.
274,090. Hopper for Pulverizing-Machines. Hermann B. Feldmann, Philadelphia, Pa., Assignor to Stephen P. M. Tasker, same place.

GRANTED MARCH 20TH.

274,211. Amalgamator. William T. McGinnis, New York City.
274,215. Ore-Crushing Machine. Franklin Morey, Brooklyn, N. Y., Assignor to Oscar W. Turner, Oak Park, Ill.
274,243. Drilling-Machine. Edward J. Worcester, Worcester, Mass.
274,320. Regenerating-Furnace. Isaac Harper and Samuel Harper, Pittsburg, Pa.
274,357. Fire-Brick. William S. McKenna, Pittsburg, Pa., Assignor to Harbison & Walker, same place.
274,403. Metallurgic Furnace. Samuel P. Spooner, Bucklin, Assignor of fifty-one seventy-seconds to Daniel B. Holmes, Robert H. Drennon, William C. Duvall, and Emil Werk, all of Kansas City, Mo.
274,450. Furnace for Consuming Smoke and Heating Water. Edward Livermore, New York City, Assignor to Horace Galpen, same place.
274,453. Furnace for Burning Pyrites. James Mason, Eynsham Hall, Whitney, County of Oxford, England.

GRANTED MARCH 27TH.

274,524. Continuous Rolling-Mill. Martin V. Smith, McKeesport, Pa.
274,525. Continuous Rolling-Mill. Martin V. Smith, McKeesport, Pa.
274,581. Dry-Ore Concentrator. Willard B. Farwell, New York City, Assignor of five eighths, by direct and mesne assignments, to John Landers and J. M. Taylor, San Francisco, Cal.
274,587. Cinder-Car. Frederick W. Gordon, Pittsburg, Pa., Assignor, by mesne assignments, to himself and James P. Witherow, same place.
274,667. Feed-Hopper and Bell for Blast and other Furnaces. Edwin Shepard, Goshen, Va.
274,678. Apparatus for Bending Rails and Bars. Ladislav Vojacek, Sinichov-Prague, Bohemia, Austria-Hungary.
274,717. Apparatus for Purifying Iron. Thomas H. Burridge, St. Louis, Mo., Assignor of one third to William L. Reynolds, same place.
274,740. Expansion Rotary Drill. Samuel W. Douglass, New York City, Assignor to the American Diamond Rock Boring Company, same place.
274,747. Apparatus for Separating Slate from Coal. John Fern, Hyde Park, Pa.
274,786. Cinder-Car. William Kelly, Scottdale, Pa.
274,829. Gas-Generator Stove. Nicholas H. Schilling and Hans Bunte, Munich, Bavaria, Germany, Assignors to Stettiner Chamottefabrik Actiengesellschaft, formerly Didier, Stettin, Germany.
274,856. Rolling-Mill. Richard Uren, Houghton, Mich.
274,882. Apparatus for Detecting Mineral Ores. Frederick H. Brown, Boulder, Colo.
274,884. Turbine-Wheel. Nathan F. Burnham, York, Pa.
274,889. Manufacture of Iron and Steel. James Henderson, Bellefonte, Pa.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, April 6.

The mining market has been very dull, and depression has seemed the ruling feature. Sonora Consolidated has been the most active stock dealt in, and it was manipulated up and down at times in quite a lively manner. Robinson and Sierra Grande have been rather dull, and both stocks show weakness. The other stocks mostly dealt in were Amie, Decatur, Elko Consolidated, Lecrosse and Oriental & Miller. There is no material change in their prices. Below will be found a summary of the market. The total number of mining shares sold at all the Exchanges aggregates 421,415, as against 346,695 last week.

The Comstock shares have been very quiet at steady prices. California was quiet and steady, selling from 22@20@21c. Consolidated Virginia records a moderate business, and was a little stronger; it sold from 45@52 50c. Sierra Nevada had a small business at steady prices, selling from $2.20@$2.30. Union Consolidated was dealt in to the extent of 200 shares at $3.50@$3.40. Mexican was steady, under a small business, and sold at $2.88 @$3.13. Ophir sold at $2.25, with one small transaction. Sutro Tunnel was active and steady; it sold from 18@21c., the business aggregating 14,750 shares.

The Leadville stocks were also quiet and steady. Amie records a very active business, and suffered a slight decline from recent prices; it sold from 26@21c. Chrysolite was quiet and irregular, selling from $1.15@$1.25. Dunkin sold from 23@20c., with a business of 900 shares. Hibernia was quiet and a little weak at 4@3c. Iron Silver had a small business at steady prices, selling from $2.85 @$2.90. Leadville was quiet and steady; it sold from 71@68c. Little Chief records a business of 3000 shares at 39@42c. Big Pittsburg sold at 17@15c., under a small business. Climax was dealt in to the extent of 5000 shares at 9@7c.

The Bodie stocks were quiet and steady. Bodie Consolidated was quiet and steady, selling from 80@90c., assessment unpaid, and from $1.40@$1.45, assessment paid. Standard records strong prices under small transactions, and sold from $6.50@$7. Bulwer was quiet and a little weak, selling from 88@80c.

The Tuscarora stocks were almost neglected, and prices generally were weak. Grand Prize sold at 75c., assessment paid, and at 45c., assessment unpaid. Argenta was very quiet at 36c. Belle Isle records a small business at irregular prices, selling from 50@60 @50c. Navajo has grown weaker, declining from $3.60@$3.@$3.30 under a business of 4750 shares. North Belle Isle sold at 35c., with one transaction. Elko Consolidated was very active and a little weak, selling from 13 9@10c., with a business of 20,100 shares.

In the miscellaneous list, Alice has been quiet and steady; it sold from $2.85@$2.90. Eureka Consolidated developed a small business and was a little weak, selling from $5.25@$4.50@$4.75, assessment unpaid, and at $6@$6.25, assessment paid. The Green Mountain stocks were quiet and a little weak. Gold Stripe sold at 7@5c. Green Mountain was strong, selling from 75@82c. Rising Sun sold at 5@4c. and Cherokee at 3@2c. Horn-Silver records a small business, and was steady; it sold from $7.50@$7.88. Northern Belle showed signs of weakness, under a moderate business, declining from $10@ $8.63@$8.75. Robinson Consolidated was very active, and continues to grow weaker; it sold from 77@ 64c., closing at 67c. to-day, the sales amounting to 38,725 shares. Sierra Grande has been active and very irregular, selling from $1.85@$2@$1.80. Silver King records a small business at about steady prices, selling from $11@$10.75.

Alta-Montana was quiet and steady at 9@8c. Bradshaw records a small business at steady prices, selling from 30@28c. Central Arizona was quiet and steady; it sold from 30@33c. Decatur had an active business and was irregular, selling from 6@ 4@5c. Durango was quiet and steady at 5@6c. Harlem Milling and Mining Company had a fair business and continues strong; it sold from $1.40@$1.50@$1.45. Lacrosse was active and steady, selling at 15@14c., with a business of 12,600 shares. Oriental & Miller was also quite active and was strong; it sold from 15@18@17c. Rappahannock sold at 8c. under a small business. Red Elephant was steady at 7@6c. Silver Cliff records a small business and sold at 33@35c. Sonora Consolidated had a large business, and was very irregular; it sold up from 46@53c., then down to 40c., up again to 45c., closing weak at 35c. South Hite, new, was quiet and steady at 20@28c. South Pacific was active and steady, and sold at 6@5c. The State Line stocks were quiet and steady; Nos. 1 & 4 sold at 3@2c., and Nos. 2 & 3 at 6@4@5c. Taylor-Plumas records a small business at steady prices, selling from 18@ 17c.

The Directors of the National Petroleum Exchange have issued a circular to their members in regard to the proposed consolidation with the New York Mining Stock Exchange. It gives the terms of consolidation, points out the advantages to be derived, and concludes by stating that a general meeting will be held on Tuesday, April 10th, between eleven A.M. and four P.M., at which members will vote for necessary amendments to the by-laws and constitution of the Exchange, in order that the consolidation may be effected.

MEETINGS.

Bulwer Consolidated Mining Company, Room, 29, No. 309 Montgomery street, San Francisco, Cal. Annual meeting of stockholders and election of trustees, April 11th, at one o'clock P.M.

Fletcher Gold and Silver Mining Company, No. 211 Pearl street, New York City. Annual meeting of stockholders, April 10th, at twelve o'clock M.

Spring Valley Hydraulic Gold Company, No. 61 Broadway, New York City. Special meeting, called by a resolution of the Board of Trustees. Matters of importance will be presented. April 23d, at twelve o'clock M.

DIVIDENDS.

The Castle Creek Gold Mining Company, of Idaho, has declared its regular monthly dividend (No. 11) of three per cent, payable April 16th.

The Holyoke Mining Company, of Idaho, has declared its regular monthly dividend (No. 7) of two per cent, payable April 13th.

The Mount Pleasant Mining Company has declared a dividend of ten cents per share, payable at the office of Laidlaw & Co., No. 14 Wall street, New York City, April 16th.

The Navajo Mining Company, of Nevada, has declared a dividend of twenty-five cents per share.

The Standard Consolidated Mining Company, of California, has declared a monthly dividend of twenty-five cents a share, payable on April 12th, at the Farmers' Loan and Trust Company's office.

The Yellow Jacket Mining Company, of Nevada, has declared a dividend of twenty cents per share.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, brokers in Petroleum and Mining Stocks, No. 55 Broadway, report as follows for the week ended April 6th:

On Saturday, March 31st, oil opened at 94½c., and closed stronger at 95⅝c. Monday, it sold up to 96c. Tuesday and Wednesday, the fluctuations were chiefly between 94½c. and 95½c., and transactions were limited. Yesterday (Thursday), prices broke to 91¼c., rallied to 93⅞c. and reacted to 92c., and to-day the market was featureless at from 91 to 92¾c. There does not appear to be a well-defined idea concerning the wells lately opened up. That they have at least temporarily increased production is conceded; but from the history of the wells in the same formation, no great expectations are entertained of the permanence of the new production. The "mystery" which the owners of the Murphy well made has given way to the reliable report that its first day's product is 140 barrels, or relatively small; but as it lies inside the territory of the Cooper tract, greater significance is attached to it than would otherwise be the case. The latest candidate for honors as a "market-smasher" is the Welch well, about which conflicting reports have been circulated, but from present indications it will not prove a large producer.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

		Opening.	Highest.	Lowest.	Closing.	Sales.
March	31....	$0.94	$0.96¼	$0.94	$0.95⅝	537,000
April	2....	.95¼	.96⅛	.93¾	.94⅛	542,000

	6....	.91⅞	.92⅜	.90¾	.91	722,000
Total sales.....						3,919,000

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has not developed any material changes this week. The Comstock shares have been steady in price throughout, although a strong "boom" was developed in Hale & Norcross, made through a fight for the control of the company. The Yellow Jacket Company has declared a dividend of twenty cents per share. The Savage Company, on the other hand, has levied an assessment of $2.25 per share. The Tuscarora stocks have been weak, and show a decline. There are good reports from the mines, especially Navajo, but notwithstanding this, the stock has fallen off.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, April 5.

To-day being Fast-day, there have been no quotations, the Exchanges being closed. Our report is made up to the close of business on the 4th. The decline in ingot copper to 16c. per pound for Lake has had a depressing tendency on the market for copper stocks; and although the decline has not been very marked as yet, any efforts to sell large blocks of stocks would result in much lower prices than we have seen for some years. Calumet & Hecla has ruled dull, with small sales at $242@$241. Franklin declined from $12@$11. Although the latest advices from the mine are favorable, yet the lower price of ingot copper will doubtless prevent the payment of a dividend the coming year. Pewabic declined from $6 (March 22d) to $5. The outlook for this company is not as favorable as its friends would desire. Quincy started off this week with an advance from $49⅛@$50, with a gradual decline from this figure to $49¼, and has held quite firm at $49 bid. The March product of this mine was 225 tons, against 195 tons last year. Osceola declined from $29@26, with a subsequent recovery to $27. There is more of this stock offering than usual, and a further decline would not be unexpected. Atlantic, on a small sale, advanced from $11@$12. Huron, the last sale of which was on March 7th, at $1½, showed exceeding weakness to-day by selling at 50c. Advices from the mine, under date of March 24th, state that the mine is looking as well as ever; but we suspect that later news has something to do with the decline and pressure to sell the stock to-day. Allouez sold at $2¼, an advance of 25c.

In silver stocks, Bonanza advanced from $1@$2¼. Catalpa declined from 45@40c., but later advanced to 47½c., closing at 45c. bid. San Pedro advanced from 50@60c. Harshaw sold at 75c., and Sullivan at $1. At the Mining Exchange, there was no special feature. Prices are generally lower, and business dull and uninteresting.

Sullivan, $1 asked. San Pedro, 55@60c.

METALS.

New York, Friday Evening, April 6.

Copper.—During the week, the leading Lake companies astonished the trade by offering Lake copper freely at 16c., and some sales, aggregating possibly 400,000 pounds, were made at that figure, and it is rumored at even less. This action clears the sky for the time being; and after consumers have become convinced that they will not be able to do much better, a livelier buying movement will be inaugurated. In consequence of the constant decline in the price of the raw material, values of manufactured goods, though nominally prices were unchanged, have fallen off steadily, and the cutting which has gone on for months has demoralized the customers. The opportunity is now offered to restore confidence, and then

G. Gold. S. Silver. L. Lead. C. Copper. * Non-assessable. † Stocks quoted on S. F., San Francisco; B., Boston; P., Philadelphia. Non-Dividend shares sold, 280,760. Total shares sold, 421,415.

greater steadiness in the market of the metal may be expected. Other brands are offered at prices varying from 14·90@15·75c. We learn that a large Western producer of standard copper declined an offer for export from a point on the southwestern coast, and sold one million pounds to an Eastern refiner. If, as we learn, the price for export was a little better, it is to be regretted that such an important lot was not sent away. English quotations are unfavorable, Chili Bars having fallen off to £64@£64 10s. against £65 10s. last week, while Best Selected remains nearly the same, £72@£72 5s. Lake generally brings considerably more than Best Selected, the last sale, a few weeks ago, of 1500 tons, realizing £77. We discuss editorially some of the points suggested by the situation.

Under date of March 22d, Vivian, Younger & Co., of London, quote ores and regulus at Liverpool or Swansea, 13s.@18s. 6d. per unit, delivered in warehouse.

Tin.—The market has been unsettled, with little business transacted. London dropped to £94 yesterday, but reacted to £95 10s. to-day. At the close, 20¾c. is bid and 21⅛c. asked for spot Straits.

Lead.—The situation is unsettled temporarily, and, during the first four days of the week the continuance of negotiations between a pool of buyers offering to take 3500 tons at 4·40c., of Richmond lead, kept matters in suspense. Since then, common lead has been offered freely for April delivery at 4·40c.; but

Digitized by Google

as most large consumers are tolerably well stocked for this and a part of the coming month, it has not resulted in any business. Refined is procurable at 4·55@4·60c. During the month, 700 tons of Germania lead are due, which will probably be sold on arrival.

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day:

We note eight sales, during the early part of the week, of 110 tons Refined, at 4·12½c. and 4·15c., and Wednesday, 230 tons of Chemical Lead, at 4·12½c. Receipts were 600 tons, against 500 tons last week.

Spelter.—This market is very quiet, with values falling off slightly. We quote: 4·70@4·80c. for Common Domestic.

Preliminary estimates of the production of spelter in Siberia for 1882 place the make at 69,964 metric tons, compared with 67,547 tons in 1881, an increase of 2417 tons.

Antimony.—Business has been slow, our quotations being 10c. for Hallett's and 10⅞@11c. for Cookson's.

BULLION MARKET.

NEW YORK, Friday Evening, April 6.

The completion of a small continental order for silver, and a decline in India exchange, have induced lower rates in London; but an advance in sterling exchange here has nearly met this, as our figures show. The market is not strong.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended April 6th, as compiled from various sources, amounted to $236,000, as against $146,644.34 reported for the previous week. The receipts from January 1st, 1883, to date are $3,818,208.08.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended March 31st	$539,700
Corresponding week last year	310,450
Since January 1st, 1883	4,144,610
Corresponding period last year	13,061,753

Imports.

Week ended March 31st	$693,798
Corresponding week last year	144,044
Since January 1st, 1883	8,846,467
Corresponding period last year	1,085,613

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the rate of discount, which remains 3 per cent. The outside rate is fully up to the bank rate. The bank lost during the week £378,000 bullion, and the proportion of reserve to liabilities was reduced from 38¼ last week to 34 5-16, against 36⅝ at the same time last year. The weekly statement of the Bank of France shows a decrease of 1,850,000 francs in gold and 500,000 francs in silver.

Silver Coinage Allotments.—Owing to the large accumulation of silver coin at the San Francisco Mint, the Director of the Mint has ordered that the coinage allotment for that mint for the month of April be fixed at $400,000, which is $200,000 less than the allotment for March. The coinage at the Philadelphia and New Orleans mints will be correspondingly increased.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, April 6.

At the Wall Street Iron and Metal Exchange, the following directors were elected: Theodore Sturges, President; John C. Cook, Treasurer; William Allen Smith, Secretary; A. W. Humphreys, James Hall, F. L. Lehmann, B.F. Judson, J. Fred. Pierson, William Houston, Daniel F. Cooney, Morton B. Smith, T. D. Hazard, James E Pope.

American Pig.—Apathy still continues, but still prices are tolerably well maintained on the part of increasing stocks. The demand, however, is slacker at the seaboard than in the interior, where large quantities of forge iron are used, and of the sale of which we hear little. There is an entire absence of speculation, and the producers and consumers, being pretty wide apart in their views, show no inclination to give up their respective positions. The makers of other than standard brands of foundry irons are, however, weaker and make concessions. We quote $22.50@$24.50 for No. 1. Foundry, ordinary to choice; $21.50@$22.50 for No. 2; and $19@$20 for Gray Forge. Bessemer pig sales aggregating 10,000 tons are reported at a price equivalent to $21.75 here; quotations range from $21.50 bid to $22 asked. Spiegeleisen has been more active, at $32 for 20 per cent, and $26 for 12 to 15 per cent.

Scotch Pig.—The only feature worthy of special comment is the falling off in the arrivals. Freights are still low from Glasgow; they have, however, stiffened from Liverpool to 10s. Business is on a small scale only. We quote Coltness and Langloan, $24@$24.50; Glengarnock, $22@$22.50; and Eglinton, $21@$21.50. At the Wall Street Exchange, the following cables were received to-day: Carnbroe, 55s. 3d.; Gartsherrie and Summerlee, 61s. 6d.; Coltness, 64s.; Langloan, 64s. 3d.; Glengarnock, 54s. 9d.; and Eglinton, 49s. Warrants are 46s.

Rails.—There is a fair inquiry for small lots, and we note sales aggregating from 5000 to 6000 tons at $39 at mill.

Old Rails.—No business of any magnitude has been done, except a sale of 300 tons of D. Hs. at $28. We quote Ts $23.50@$24, and D. Hs. spot $28, with very little here.

Scrap.—Scrap is dull and lifeless at $25 ex ship.

Philadelphia. April 6.

Pig-Iron.—Representatives of standard brands of pig-iron have made a number of satisfactory sales at $20 for Gray Forge, $24.50@$25 for No. 1, and $24 for poor quality, with occasional transactions at less. No. 2 sold higher and lower this week than usual. The concessions which pig-iron men have been finally induced to make led to a good deal of businesss, and more is going through. Furnace stocks have been pretty well depleted by contracts placed, but deliveries extend over the second quarter of the year. Some mill iron sold at $18.50@$19 at furnace.

Merchant Iron.—The rolling-mill owners are not satisfied with current rates for finished bars, but they can not help themselves at present. The average price for Refined Bars is 2·25c.; Ordinary 2@2·10c. A strike is not out of the question, as the Western manufacturers contemplate a 10 to 20 per cent reduction. Such a course would bring about an artificial scarcity, and in view of possible complications, a number of inquiries for large supplies have been heard of. Skelp iron is 2¼@2½c., with concessions. Nails are in good demand at $3.15@$3.30. Bridge and boiler plate is active, and inquiries for summer requirements for common plate and structural iron are under consideration.

Sheet-Iron.—Plain and galvanized has met with more inquiry, but the general character of trade is retail.

Steel.—Steel is improving, but sales of large lots are made at concessions.

Steel Rails.—Some few large orders have been placed in Bessemer mills under $39. The total sales for the week reported from all quarters are large. Small lots, $39@$40.

Old Rails.—Tees are quoted $24.50 in small lots, and Double Heads, $28.

Scrap.—Moderate demand at $25@$26 for No. 2; $27@$28 for No. 1.

COAL TRADE REVIEW.

Anthracite.

NEW YORK, Friday Evening, April 6.

The situation has not materially changed. Not withstanding the unshaken determination of the great coal companies to keep the production within the limits of the demand, and the inference to be drawn from it that they will not go lower in prices, consumers appear almost to a man to have the idea that they will do much better by waiting. How far this policy is a wise one remains to be seen, especially when it is considered that freights are exceptionally low, charters being made to Boston at $1 and to Providence at 70 cents. The Eastern trade so far has been a disappointment, much more so than the local trade, which has been fair in the aggregate. Here the complaints come principally from the middlemen, who appear to be left out in the cold. Coal is accumulating now, waiting for the opening of lake navigation, when a strong movement to the West is expected; those markets being practically bare of anthracite.

The production of the present year is creeping up at a rate of increase over the last of about 15 per cent. The restriction ordered by the coal companies, however, will keep this increase within the bounds set by the growth of the demand.

Bituminous.

As a slightly encouraging sign after the deadness of the past few weeks, it may be noted that there are at least occasional inquiries. We understand that several of the larger contracts are in the market, but none has as yet been closed. Low offerings of coal continue to be made, some of the figures we hear of being surprising. They can only be accounted for, so far as Cumberland is concerned, by the low cost of putting coal on board at Georgetown, where coal is held at $3.20@$3.25, leaving a good profit for shippers. We quote Clearfield nominally $4.40@$4.50, and Cumberland $4.50@$4.60, though we hear of transactions at lower figures.

From Philadelphia, a correspondent sends us the following, under date of April 5th:

This is a short week, and it has been decided to continue the curtailment next week. The purchasers are not coming forward as it was natural to expect they would, after a long winter and active consumption. A feeling that coal may be lower prevails, notwithstanding the determination shown by the trade not to crowd the market with surplus coal. The prices, particularly of stove, both at tide and to the local trade, are higher than last year at this time, and account for the reluctance of buyers to order freely. The companies are waiting, knowing they will have to come; and it is expected that the moment the Western outlet is open, buyers will get a practical demonstration that rates can be maintained.

Vessels are scarce, but orders not being plenty, the freights remain what they were last week, and low freights seem to be expected by the best informed.

Horsford's Acid Phosphate.

Overworked Nervous Systems.

Dr. EDWARD L. DUER, Philadelphia, says: "I have used it for several years, considering it valuable in overworked nervous systems and in the exhausted condition following protracted fevers."

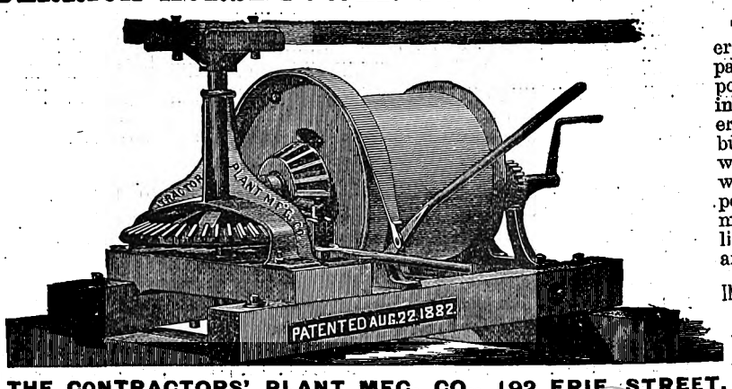
WANTED—$20,000,

to complete working capital of a fully developed, proved, and equipped

Mining and Milling Property.

Full security given and very large profits assured from the start.

Address GOLD COIN,
P.O. Box 1833, New York.



STEAM PUMPS.

FOR SALE.—A large number of Steam Pumps of all makes, and ranging in size from small tank or boiler feeds up to very heavy service machines.

While the stock lasts, good bargains are open for Miners, Water-Works, Rolling-Mills, Furnaces, or any one needing to move fluids by steam. Call upon or address

JOHN A. HINCKLEY, Purchasing Agent of
THE UNITED PIPE LINES, OIL CITY, PA.

DERRICK HORSE-POWER FOR MINERS AND BUILDERS.

This is a horse-power designed principally for mining purposes or raising building material in the erection of high buildings. A horse will raise a bucket weighing 600 to 700 pounds 75 feet per minute. Is small, light, easily handled and durable.

THE next meeting of the American Institute of Mining Engineers will be held at Roanoke, Va., during the first week in June.

GEN. S. V. BENÉT, Chief of Ordnance, announces that, as Congress has failed to appropriate money, he can not pay the freight charges on material sent for testing to the Watertown Arsenal.

MR. C. M. ROLKER will leave for the West about the beginning of May, to examine some mining properties. Those desiring to communicate with him should address him at No. 63 Broadway until May 5th, and care of Messrs. HAGEN & BILLING, No. 1 Wall street, after that date.

SPAIN appears to be forging ahead as a great mineral-producing country. The exports of the years 1881 and 1882 were, according to recent statistics, as follows, the unit being the metric ton :

	1881.	1882.
Metallic copper	17,710	22,708
Quicksilver	1,779	1,067
Iron	37,903	40,115
Lead	105,809	116,132
Zinc ore	30,604	25,832
Copper ore (presumably pyrites)	452,475	571,442
Iron ore	3,137,083	4,021,761

The increase in copper and pyrites, in pig-lead, and in iron ore is striking ; while on the other hand, the falling off in the export of quicksilver is very great.

PROF. L. GRUNER, of the Paris School of Mines, the great French mining engineer and metallurgist, died last month. He suffered a few years ago from a severe attack of sickness, and had since then, though he partially recovered, been able to do comparatively little work. He was one of the honorary members of the American Institute of Mining Engineers, in whose progress and prosperity he took a great interest.

THE TRANSMISSION OF POWER BY ELECTRICITY.

There has been a great deal of misapprehension and error in regard to the transmission of power by electricity, and earlier experiments, notably those made at Munich, have failed to furnish data of value. The results of a series of tests, carried on with great accuracy by M. TRESCA and Dr. HOPKINSON at Paris, and now published, will, therefore, be welcomed, as furnishing indications where the principal losses of power are to be sought, and how far they may be avoided. To those engaged in mining and metallurgy, they are particularly interesting, because the special circumstances under which operations in those industries are carried out are such as to open a wide field for usefulness. We print elsewhere the records of two instances where the electrical transmission of power was employed in French mines, and shall in the future add others relating to Austrian and German mines.

The Paris experiments, at which a plant put up by M. MARCEL DESPREZ was used, consisted of two machines, the generator and the motor, placed side by side, but connected with a four millimeter or No. 9 Birmingham gauge telegraph wire, carried to Bourget, a suburb of Paris, and back again, a distant of 10½ miles ; but as the two poles of the machines were connected by a short conductor, the conditions were the same as though the power had been transmitted a distance of 5¼ miles.

During the first series of experiments, the average of six trials showed that of 6·21 horse-power developed at the dynamometer, the generator, the producer of the electric current, running at a speed ranging from 571 to 633 revolutions, developed an electric power at its terminals of 4·43 horse-power. The power consumed in the transmission of the current through the wire to the motor was 1·31 horse-power, leaving the electric wire in horse-powers at the terminals of the motor 3·12, the motor running at a speed varying between 315 and 418 revolutions. The loss at the motor was 1·09 horse-power, and only 2·03 horse-power were transmitted to the brake, thus showing the efficiency of the entire plant to be only 32·6 per cent.

In these experiments, it was therefore shown that the efficiency of the three parts of the plant, the generator, the conductor, and the motor, was closely 70 per cent for each, and that approximately one third of the power applied to the generator may, under the conditions of the plant used, be made applicable to the driving of machinery at a distance of 5¼ miles.

A second series of experiments was conducted with the same plant, but so modified as to drive the generator with greater speed, ranging between 705 and 883 revolutions per minute. On an average of four trials, the motive power measured at the dynamometer was 10·389 horse-power, of which 8·193 horse-power was actually transmitted to the generator, which consumed 1·498 horse-power, leaving 6·799 horse-power, which, by the conversion of electricity into heat during the passage of the current from the generator, through the wire transmission to the motor, was reduced by 1·373 horse-power. Out of the 5·426 horse-power left, 2·123 horse-power was consumed by the resistance of the motor, thus carrying down the power transmitted to the brake to 3·304 horse-power, equal to an efficiency of 31·9 per cent, or 40·8 of the power communicated to the spindle of the generator. The loss of power in the generator and the motor can be only partly traced to its source. In the second series, where, by the way, these losses were relatively heavier, it has been computed that the electrical power consumed by the conversion of electricity into heat was 0·549 horse-power in the generator and 0·814 horse-power in the motor, leaving a loss of 0·844 and 1·309 horse-power respectively as a supplementary loss of work, which is due to a variety of causes, and which careful study of the conditions will probably reduce.

The efficiency of a plant for the transmission of power may be considerably increased also by the use of conductors offering less resistance and well isolated. By generating electricity of high tension, the thickness of the conductor and its cost may be reduced ; but, on the other hand, this expedient has its drawbacks that may counteract its advantages.

From the data at present available, it appears that the best economy is to bestow much attention and invest a greater outlay in the construction of the conductors.

The possibilities of the use of the transmission of power by electricity are undoubtedly great, and there are many localities where the utilization of a head of water above or below ground will prove valuable, even though the loss and the investment of capital may be great. It may be expected to compete successfully with compressed air, wire-rope transmission, or water under pressure.

It may be of interest to call attention to the fact that the Mansfeld Copper Mining Company, of Germany, has recently offered a prize of 5000 marks, or about $1200, for the best design of a plant to transmit power under ground to a considerable distance, 1700 to 3200 feet or more.

Digitized by Google

The conditions are, that the power available shall not be less than ten-horse; and it is left to the designer to employ a motor below ground, or to transmit the power from the surface, upon the condition that the rotating parts of the transmission shall not have a speed exceeding 100 revolutions, the cost not to exceed the use of steam-power. It is probable that a very interesting series of designs, bringing out the relative points of the various methods of transmitting power, will be offered, there being no restrictions as to the method chosen, and we trust that the leading representative designs will be published.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes. We do not hold ourselves responsible for the opinions of our correspondents.]

The Working of the Nichols Furnace.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: We notice in your last week's issue a description of the furnace in use at our works, in which some figures are given of different days' runs. We should like you to mention, in explanation of the apparent burden carried by the coke, that the latter, besides being of very ordinary quality (gas-coke), contained about fourteen per cent of moisture, having been exposed in our yard for a long time. It was also very dirty. In the runs given of the 48-inch and 36 by 66-inch furnaces, there is no mention made of old slag also used in the charges. These explanations make a better showing for the work of the furnace than is apparent on the figures presented by you last week. Yours truly, G. H. NICHOLS & CO.

NEW YORK, April 10.

The New York Metal Exchange and the "Iron Age."

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: A very spirited article in the *Iron Age* of April 5th announces that they have at last waked up at 83 Reade street, and are making a praiseworthy effort to find out how much they are behind the times. Their ideal of a metal trade seems to be some half a dozen merchants who shall act as local agents of the manufacturers by buying contracts of metal and peddling it out in retail lots in faithful adherence to the quotations in the *Iron Age*. This plan might work to advantage if this valuable organ was only published in Oshkosh or in Skowhegan; but the New York market, unfortunately, long since gave up in any way regarding the prices that the *Iron Age* solemnly sends forth once a week, with a calm disregard of intermediate fluctuations. The paper still keeps up an air of benevolent patronage of the trade; and when, a year ago, the movement to start an Exchange began, there was quite a scare in Mr. Williams's office at the idea that the "organ of the metal trades" was to be robbed of the controlling influence that it still fondly believed it exercised. When the split came that resulted in the formation of two Exchanges, confidence was restored, and after a most courteous treatment of both sides, the *Iron Age* ignored the existence of both, and went on quietly in its old way, sure that the two Exchanges would destroy each other, and that there was no necessity for enterprise or a remodeling of the methods that this venerable journal has pursued for a quarter of a century.

And now comes another rude shock. All the differences between Pearl street and Wall street having been satisfactorily adjusted, a plan of consolidation is agreed on, and the *Iron Age* finds itself confronted afresh with the necessity to adapt itself to the changed conditions that have been developed since it really was a power, and to make some effort to progress with the expansion of the metal trade consequent on the enormous growth of New York's commerce. It finds all its predictions disproved and its most cherished prejudices disturbed. The effort is too great, and the usual refuge of the inveterate conservative is sought in denial of every thing that is before it. The editor loses none of his genial politeness in his editorial, but in his most suave manner announces —as I heard suggested to-day—"that here are four hundred fools, and he alone the wise man" of the metal trade. He complains most pathetically that the prices at Pearl street have not always agreed with his quotations; but surely it was a little unreasonable to expect them to. He tells us, in his knowing way, that all four hundred of us are very much dissatisfied with our experiment of one year, and do not want to try it for another. We do not agree with him, and are proving it by proceeding to try; but possibly we are all wrong, and he is right. The arguments that he uses we remember faintly to have heard a year ago, and as they have not been proved by experience, we see no reason why this new strong organization should not be of as great service to our trade as other exchanges have been to other lines of business in the facilitating of transactions, the authoritative settlement of disputed points, and the drawing to New York, as the definite center of the metal trade of America, of much business that is now scattered to other points.

If we disturb the rooted traditions of Reade street, it is sad but unavoidable; and the *Iron Age* should remember that progress and growth are very apt to be uncomfortable for somebody. Yours truly,

NEW YORK, April 5, 1883. EDWARD J. SHRIVER.

THE COINAGE OF SILVER AT THE MEXICAN MINTS.—In the fiscal year 1880–1881, the following were the amounts of silver coined at the Mexican mints, according to *La Libertad*:

Zacatecas	$5,977,000
Mexico	5,691,000
Guanajuto	4,135,250
San Luis Potosí	2,315,750
Guadalajara	1,363,241
Culiacan	1,219,083
Chihuahua	1,178,534
Durango	977,964
Alamos	905,663
Hermosillo	711,250
Oaxaca	142,660
Total	$24,617,395

OFFICIAL STATEMENTS AND REPORTS.

THE HORN-SILVER MINING COMPANY, FRISCO, UTAH.

The second annual report of this company has been issued, and contains many facts that are interesting, not only to the stockholders of the company, but also to the mining public in general. The Horn-Silver is the greatest single producer of lead, and, with the exception of the Richmond Company, of Nevada, is the only one which mines, smelts, and desilverizes. The figures submitted are exceptionally full and complete, and therefore make the Horn-Silver report a document which will be studied with profit, particularly those parts relating to smelting and refining.

In extracting 47,232 tons of ore, and driving 1808 feet of levels and cross-cuts, 121 feet of uprise, and sinking shafts 472 feet, the following amount of labor was done:

	Days' work.
Surface engineers	1,118¾
Firemen	646¾
Blacksmiths	436¾
Carpenters	1,149¾
Timber-men	647
Car-men	1,536
Laborers	9,082¾
Watchmen	58
Miners on ore	17,048¾
Miners' dead-work	4,301
Total	36,024¾

In the distribution of the dead-work in the different levels, there has evidently been some error. We find the sixth level credited on the one hand with 19 days' labor for dead-work, while elsewhere we are informed that it has been extended 210 feet. In the main shaft, 172 feet were sunk with 605 days' work; and in No. 4, 300 feet, with only 318 days' work.

The supplies used stand as follows:

Coal	140,000 pounds.
Wood	863 cords.
Candles	713 boxes.
Powder	703 kegs.
Fuse	54,500 feet.
Timber	1,233,082 feet.
Illuminating oil	464¼ gallons.
Lubricating oil	126 "

The total cost of mining 47,232 tons was $209,535.08, or say $4.44 per ton. The various parts from which the supplies of ore were drawn are shown in the following table:

	Net tons of ore.	Average assay. Lead, p. c.	Silver, ounces.
First level	2,533·85	36·8	52·8
Second level	23,344·34	37·0	31·5
Third level	18,788·52	38·9	36·3
Fifth level	115·42	34·2	15·8
Total	44,782·13	37·8	34·2

The bulk of this ore, 41,808·90 tons, went to the Francklyn smelter; but as a certain amount was also smelted at the Frisco smelter, it is not possible, from the data given, to present a full account of the quantity of materials used and the cost.

Mr. A. Raht, the superintendent, gives the following statement of the materials consumed, we presume by both smelters, in 1882:

	Tons.
Ore	42,748
Limestone	20,657
Iron ore	9,652
Morgan slag	3,754
Coke	15,679
Charcoal	534
Stone coal	1,708
Frisco matte	613
Scrap-iron	114

The product was 14,329·8 tons of bullion, carrying on an average 100·4 ounces of silver, the loss being 9·71 per cent of lead and 2·10 per cent of silver. Closer work, it is stated, would unduly increase the cost. It will be noted that the quantity of limestone used was very high. Mr. Raht speaks very well of the steel jackets which he uses now in his Francklyn furnaces. He places the average cost of smelting at Francklyn at $14.78 and at Frisco at $29.41. From the financial statement, we take the following, giving an itemized account of the expenditures at the two works:

	Frisco. (5176 tons.)	Francklyn. (43,374 tons.)
Labor, supplies, and expenses	$33,228.36	$160,892.23
Iron ore	45,081.92	86,032.43
Limestone	721.59	33,262.15
Charcoal	30,243.24	11,184.09
Coke	32,329.44	323,953.41
Wood	6,990.50	.....
Coal	.....	9,738.66
General expenses	3,600.00	4,800.00
	$152,195.05	$635,852.97

Assuming that the ore was very nearly the same in character, it will be seen that the cost of flux at Frisco, where iron ore was almost exclusively used, was $8.85 per ton; while at Francklyn, where a large proportion of limestone was substituted therefor, it was $2.75. We are not sufficiently familiar with the sources of the supply of iron ore and limestone at the two smelters to judge how much of this large saving is due to differences in cost of transportation; nor is it possible, in the absence of data, to determine how largely the great difference in the cost of smelting at Frisco and at Francklyn is counterbalanced by the cost of shipping the ore farther. We find only this item: "Freight on bullion and ores to Salt Lake, $287,168.70." Mr. Harry C. Hill, general manager, states that the Utah Central Railroad reduced the freight charges on ore to the smelter one dollar per ton; but no reduction seems to have been made on coke, fluxes, or bullion. It is expected, however, that the completion of the Denver & Rio Grande Railroad to Salt Lake will in some measure relieve the company from the high rates paid.

According to reports by Mr. Frederick Honkamp, of the Chicago refinery, 16,082 tons of bullion were treated at a cost of $9.05 per ton. This cost, which is low, considering the fact that the plant, as we understand, is not equal to more modern works, is not itemized. The only

Digitized by Google

figures showing how it is distributed are the following: Fuel, $42,981.39; labor; $61,640.93; and expenses, $40,782.81; total, $145,405.13. Last year, we found occasion to doubt the correctness of the allowance for loss on lead, 7¼ per cent. This year, Mr. Honkamp, we are pleased to see, has carefully estimated the actual amount of lead in drosses, etc., and with their aid shows that his loss was 4·915 per cent, which, taking into account the loss still to be incurred in working these intermediate products, would carry it to nearly 5 per cent, which is the usual allowance to desilverizers. So far as silver is concerned, his statement is less clear. He has carefully estimated the quantity of silver on hand in bullion, skimmings, drossbars, and test bullion, which items also appear in the lead statement; but has apparently made up his deficiency of silver by putting down 21,803·65 ounces of silver as "in furnaces, process of refining, and drosses." Even if all of this silver should represent the loss, it would be low, being little more than one ounce per ton of bullion. It is an extremely difficult matter for the manager of a desilverizing works, without stopping the establishment and overhauling every furnace and every stock-pile, to make a close estimate of his silver on hand; and in the aggregate the small quantities discovered by a close search are generally larger than are expected. Still we doubt whether all of the silver thus carried as an asset will in reality be recovered. We have gone into this question, not with the object of criticising Mr. Honkamp's work, which is shown by the figures to have been excellently carried through, but because it is of interest to arrive approximately at the loss in silver in an American desilverizing works. The usual allowances are five ounces per ton, while in some foreign works, we believe, often a small excess over the assay is recovered.

The lead sales of the Chicago refinery were 29,135,597 pounds, which sold at an average of 4·55 cents—we presume at Chicago. The net receipts were $1,326,664.23. The silver sales yielded $2,010,125.77; the ore sales, $32,879.87; and the bullion sales, $443.77; making, with interest on call loans, $3,385,811.68. The disbursements were:

Mining	$209,805.08
Smelting	788,048.02
Freight on ore and bullion to Salt Lake	287,168.70
General expenses	13,565.60
Exchange	5,591.75
Bullion purchased	454.83
Freight on bullion to Chicago and New York	328,944.41
Refinery	145,405.13
New York office	21,247.35
Call loans, etc	536,194.91
Construction	32,313.71
Supplies on hand	64,620.15
Utah Central	1,744.57
Dividends	1,200,000.00
Cash	44,902.82
Total	$3,680,007.08

The assets, including supplies, call loans, cash and ore, bullion, silver, and lead in course of treatment, aggregate $1,137,297.29, while there are no liabilities.

THE SIERRA GRANDE MINING COMPANY, LAKE VALLEY, NEW MEXICO.

The directors of this famous mine have submitted to the stockholders a brief financial statement, dated March 16th, from which we extract the following notes on the receipts and expenditures of the company from July 20th, 1881, to that date:

The Sierra Grande sold silver bars to the extent of $1,048,436.59 and ores netting $37,266.52, which, together with $10,000, a working capital subscribed to begin development, carries the total receipts to $1,095,703.11. In the payments we note $31,000 for additional mining property, and the heavy sum of $173,518.92 for construction account. The twenty-stamp mill cost $47,388.52 for machinery and $51,859.57 for labor and freight, or $99,248.09; the water-works, $36,070.51 for plant and $20,851.15 for labor and freight, or $56,921.66; and the thirty-ton smelter and cupelling furnaces, $7415.50 for machinery and $9933.67 for construction and freight, or $17,349.17. The supplies and repairs for running the mill cost $108,231.41 and the labor, $28,430.77; the water-works, $2545.67, and the smelter, $375.60. In the mine, the supplies, including the cost of the hoisting-works, called for the payment of $26,174.16, while the labor for the mine development cost $91,470.07. Other items included in working expenses are: Freight on supplies, $7206.88; expressage on bullion and freight on ores, $14,013.65; expert examination, $2200; insurance, $1500; and interest account, $6584.46 on capital borrowed for construction and development, and repaid in full. Salaries, telegraphing, advertising, office and telegraphing expenses, $36,573.99. Including $500,000 dividends, the total expenditures were $1,029,825.58, leaving a balance of $65,877.53, to which added $75,000 bullion on hand unsold, made the total cash assets on March 13th, 1883, $140,877.53, out of which a dividend was paid on March 20th of $100,000.

The report contains no details as to the condition of the mines, or as to the working of the ores, which, it is understood, has not been an easy problem to solve. The only remark of interest is, that "the new Mill shaft has penetrated an ore-body at a depth of 300 feet, from which the inference may be drawn that the vein is continuous from the present workings, a distance of 600 feet, to the new shaft, pitching at an angle of about 45 degrees; and that there remains, entirely undeveloped, a large tract of mining property owned by your company, characterized by sure indications of the presence of the same formation of silver chlorides." Mr. Robert Bunsen, formerly of Leadville, has now taken charge of the mines.

THE CENTRAL MINING COMPANY, LAKE SUPERIOR, MICH.

The report of this company, one of the dividend-paying Lake Superior copper mines, has just been published. The product of the mine shows a further falling off, the yield having been 1,165,945 pounds of stamp copper, 399,885 pounds of kiln copper, and 98 masses, weighing 237,970 pounds—a total of mineral of 1,803,800 pounds. The quantity smelted was 960,787 net tons, yielding 70·44 per cent, or 1,353,597 pounds, of refined copper, of which 775,054 pounds were sold at an average of 17·80 cents, giving $138,014.66, leaving 578,543 pounds on hand, valued at 17 cents, or $98,352.31. The receipts for silver were $1126.02, making the total receipts $237,492.99, to which are added $5050.61 for interest, and deducted $11,767.50 for depreciation of value of mineral at mine, making the net receipts $230,776.10. The working expenses at the mine were $157,908.37, and the cost of smelting, freight, and other expenses was $33,850.15—a total of net operating expenses of $191,758.72, leaving a profit of $39,017.58, against $47,620.06 in 1881. The directors, however, sold timber lands on the Tobacco River for $100,000, payable in installments running over three years, and received in 1882 $40,000 on account. Against this they have written off $20,988.25, the cost of all the lands owned by the company, exclusive of the mine location, and they have thus added $19,011.75 to the profits of the year, enabling them to pay a dividend of $60,000. After the payment of the 1881 dividend, the surplus was $198,236.77, making the net surplus at the end of 1882 $277,254.35, less the dividend paid in February of this year, as above.

A large amount of work was done in the mine; but the vein has continued to be small in size, and although fairly productive in stamp rock and small pieces of copper, it has been almost destitute of large masses, hitherto so characteristic of it. In all, 4097 fathoms of ground were broken in openings and stopes, the average yield of mineral per fathom being 440 pounds, and of ingot 310 pounds. The average cost of sinking in shafts and winzes, 278 feet, was $28.09; drifting on the vein, 1288 feet, $10.50; drifting on the conglomerate, 149 feet, $12.11; sinking on the conglomerate, 192 feet, $16.29. Stoping on the vein, 1659 superficial fathoms, cost $15.26; and 37 cubic fathoms, $22.98; and on the conglomerate, 283 superficial fathoms, $23.62. The stamp-mill, in treating 18,639 tons of rock, running 24 heads 142 days, or 5·4 tons per day per head, required the following outlay:

Labor	$6,774.59
1913 cords of wood	6,217.25
Lights, oil, shovels	411.26
Repairs, materials, fixtures	2,653.44
Lumber, freight, and teaming	425.94
	$16,482.48

The cost of breaking and selecting the rock and tramming it to the mill was 11·6 cents, and the cost of washing and stamping per ton was 88·43 cents. The stamp rock ran 3·12 per cent of mineral, or 2·20 per cent of ingot. As the Central does not produce stamp copper exclusively, it is impossible to estimate the cost of mining this grade of copper from the data given. The mine yielded 1,803,800 pounds of mineral, running about 70·44 per cent of ingot, or about 1,270,596 pounds of copper, at a cost, including mining, crushing, smelting, and marketing, of $198,676.77, or 15·64 cents per pound, which shows, that the Central can meet present prices, even if it does not do better this year than it did last.

Mr. James Dunstan, the agent, in concluding his report, makes the following interesting statement: "The compressor and its accessories contribute materially to the reduction of our expenses, and enable us to drive, sink, and stope much more rapidly than was before possible. We now sink 100-foot lifts, and with underground engines, worked by compressed air, raise the rock from the bottom of the shaft to the first level above, which was impracticable, or at least expensive, with windlass and hand labor."

COAL USED IN THE MANUFACTURES OF THE UNITED STATES.

Aside from the great industries with which the coal trade is closely allied, statistics have been published in the Census Compendium on other branches of manufacturing which are worthy of attention. Thus, we find that in 1880 there were in the United States 5631 brick and tile-making establishments working with a capital of $27,673,616, and a force of 59,032 men, 268 women, and 7055 children, to whom the sum of $13,443,532 was paid. The yards used 1,157,522 cords of wood, $5,750,803 worth of other materials, and turned out products valued at $32,833,587.58. They made 3822 millions of common brick, 163 millions of fire-brick, 210 millions of pressed brick, $2,944,239 worth of tile, $1,765,428 worth of drain-pipe, and $729,926 worth of other products.

In looking over other industries, we find that the carpet mills used 60,641 tons of coal, the manufacturers of chemicals burned 273,161 tons of anthracite and 310,398 tons of bituminous coal, the works dyeing and finishing textiles used $1,904,551 worth of fuel, the manufacturers of felt goods consumed $77,437 worth of coal and wood, while the mills making hosiery and knit goods used fuel to the extent of $209,669. The manufacturers of mixed textiles burned 34,712 cords of wood and 134,362 tons of coal, while the salt-works used 541,179 cords of wood and 453,846 tons of coal, a small quantity being required besides in grinding salt. The silk factories use but little fuel, taking only $173,283 worth, while the woolen mills took in 1880 142,250 cords of wood and 359,769 tons of coal. For worsted goods, 72,779 tons of coal, valued at $308,421, were required. No details, unfortunately, are given as to the consumption by the glass-works.

The requirements for fuel are, of course, closely dependent in many industries upon the use of steam for power. The following table will show how the use of steam has been gaining ground during a decade in a number of industries:

	1880.	1870.		1880.	
	Total power.	Water-power.	Steam-power.	Water-power.	Steam-power.
	p. c.	p. c.	p. c.	p. c.	p. c.
Cotton goods	275,504	67·84	32·16	53·99	46·01
Flouring and grist-mills	771,201	70·74	29·26	60·94	39·06
Iron and steel	397,247	9·72	90·28	4·16	95·84
Lumber, sawed	821,928	50·03	49·07	33·91	66·09
Paper	123,912	78·25	21·75	70·70	29·30
Silk and silk goods	8,810	41·29	58·71	17·73	82·27
Woolen goods	106,507	62·17	37·83	50·33	49·67
Worsted goods	16,437	57·81	42·19	38·34	61·66

In the 85,923 industrial establishments in the country in 1880, there were in use 55,404 water-wheels, with an aggregate power of 1,225,379 horse, and 72,304 boilers and 56,483 engines, with an aggregate reaching 2,185,458 horse-power.

The merchant steam-ships of the country, to the number of 5139, with a tonnage of 1,221,206, used 3,827,993 tons of coal and 794,775 cords of wood, divided in groups as follows:

	No. steamers.	Tonnage.	Coal, tons.	Wood, cords.
New England	463	118,553	375,080	8,568
Northwestern lakes	947	222,290	488,610	255,629
Upper Mississippi	366	83,918	525,331	93,318
Ohio	473	107,472	676,347	16,474
Middle States	1,459	432,803	1,272,857	12,642

ELECTRICAL TRANSMISSION OF POWER IN MINES.

As the question of the transmission of power by means of electricity is engaging a great deal of attention just now, we think the following abstracts of two recent articles will be interesting. They are taken from *Abstracts of Papers in Foreign Transactions and Periodicals*, Vol. LXXI., Part I., published by the Institution of Civil Engineers.

The first is entitled "An Application of Electricity to the Transmission of Power at the Mines of La Péronnière," by Messrs. Charousset and Bague, and is abstracted from the *Bulletin de la Société de l'Industrie Minérale*, Vol XI., 1882, p. 5:

The energy in this case is transferred through conductors 1200 meters (1309 yards) long, from the mouth of the pit to the head of an incline 110 meters (120 yards) long, where it is employed to drive a windlass and draw the coal-tubs up the incline. There are two generating dynamos and two receiving dynamos, connected by the four conductors so as to form two independent systems and circuits, of which it is not generally found necessary to employ more than one at a time. The connection between the Gramme dynamos and the driving machinery at one end, and between the dynamos and the intermediate gear of the windlass at the other end, takes place by means of friction-pinions made of compressed paper. The machines ride upon a center situated below each of their octagonal frames, and are kept up to more or less intimate contact by screws in the case of the generators, and by a sytem of levers, under the immediate control of the attendant, in the case of the receiving machines, care being taken to provide against excess of pressure by a stop. As these machines, when receiving a current, always run in the same direction, whatever may be that of the current, the intermediate gearing contains a system of conical sliding-pinions for reversing the motion of the winding-drum.

The four machines employed are all octagonal and similar to one another. The ring is divided into four parts, passing successively before as many magnetic poles, alternatively positive and negative. Each pole is formed by two coils whose cores are formed at right angles to each other, and have one pair of similar ends brought thus together.

The other ends of these eight cores are fixed in the octagonal frames, which therefore serve to connect opposite poles. Each of the four poles nearly completes the quadrant of a circle; and from the quadruple character of the magnetic field, four brushes are necessary to each machine. The coupling is in series; that is, the entire current flows through the electro-magnet coils of both the generating and the receiving machine.

The conducting cables are formed of sixteen copper wires of 1·1 millimeters in diameter, the metal employed being perfectly pure. At the beginning of operations, these wires, placed in juxtaposition, were first covered with a thickness of paraffined cotton, which again received two envelopes of cloth treated with Chatterton's compound, and was inclosed in India-rubber and tarred. But, in spite of these precautions, the insulation did not remain perfect, on account of the damp situations in which parts of the cable had to be placed. A covering of lead was tried in damp places, but this turned out dangerous in practice, and the cables finally adopted were as follows:

16 wires of copper 1·1 diameter,
2 coats of paraffined cotton,
1 coat 5 millimeters thick of gutta-percha,
2 windings of Chatterton cloth,
1 thick coat of tarred cotton;

and the purchasers themselves finally covered the tables with a paste of the following composition:

57 pints of Norwegian tar,
38 " resin,
5 " suet,

in order to protect them, as well from heated gases as from damp.

The original cable, still maintained in the dry parts of the mine, cost 1·25 francs per meter; that finally employed in the damp situations, 3 francs per meter.

The trouble which arose before the question of the cables was finally settled was instructive. When the cheaper cable was employed for the whole circuit, the insulation in damp situations became defective in about one month. Shocks were received by the miners even through the rock in the neighborhood of the conductors, and these shocks finally caused the rupture of the cables themselves. The nature of these ruptures was peculiar. The ends of the wires exposed were untwisted, and the surface had lost its polish, being honeycombed with little cavities filled with a brown, or sometimes black, dust. The paraffined cotton, which was very white when the cable was new, presented a green color, and this discoloration extended to the exterior of the cable, and even to the walls of the pit. At four or five centimeters from the ends, the wires were found to be intact. The oxide and carbonate of copper indicated a chemical action going on between the copper wires and the water in contact with the external envelope, under the influence of the electric current. It was on account of these ruptures that the lead covering was applied, but the safety of the cable was not found to be increased by this means. On one occasion, the men below observed some large sparks in the pit, which greatly frightened them. The driver, warned by the galvanometer that something unusual was taking place, stopped the engine, and an investigation showed that the lead had been melted in several places and thrown against the walls of the pit. Where the lead had been thus removed, the Chatterton cloth was calcined, and the wires presented globules of metal which had been fused. All this occurred in a quarter of an hour, the receiving dynamo running free at the time. Since the application of gutta-percha to the cables, no such mishap has occurred. The following case of leakage occurred one day: The hauling cables, which are of iron wire, are attached to cast-iron projections on the drum, and by this means were in metallic connection with the bed-plate of the whole underground part of the installation. These cables were observed suddenly to be electrified, and at the same time a current passed through the telephone wire and set the bell ringing. Otherwise, nothing abnormal took place in the running of the machinery. The phenomenon lasted two hours, during which it was impossible to touch the hauling cables without producing small disturbances, the effect increasing with the distance from the drum. On the bed-plate itself, no shock was forthcoming.

The sudden disappearance of the phenomenon shows that it was due to some passing cause—perhaps to the presence of metallic dust on the India-rubber washers separating the bed-plate from the circuit traversed by the electric current; or, it may be, to the contact of one of the cables at a faulty point with the earth; for it was at that time that the cables began to show faulty insulation.

On a subsequent occasion, a fault in the bottom insulation of one of the machines certainly caused a derived current, and the hauling cable, then no longer attached to the metallic framework of the drum, was electrified more strongly than on the previous occasion.

It is very necessary to keep the nuts which secure the brushes firmly in the sleeve or holder quite tight. The neglect of this once caused the loosening of the brush, with the generation of large sparks.

The needle of the galvanometer indicated a much stronger current than usual, and the steam-engine was pulled up as if by a brake. The paper friction-gear became at the same time heated.

The following table gives the usual performance of these machines. It is based upon an average of experiments. The galvanometer used is simply a needle, placed over the conducting cables. It will be observed that its indications are proportional to the squares of the difference of velocities:

Machines.	Work indicated in engine-cylinder per minute.	Useful work in coal raised per minute.	Indications of galvanometer.	Speed of generating dynamo. Revs. per minute = V.	Speed of receiving dynamo. Revs. per minute = v.	Difference of speeds V − v.	Practical efficiency.	Electrical efficiency = $\frac{v}{V}$

The second abstract is taken from an article by M. Graillot, in the same *Bulletin*. It is entitled "Experiments on the Transmission of Power by Electricity at the Mines of Blanzy," and reads as follows:

These experiments were instituted in order to arrive at a knowledge of the efficiency to be expected in transmitting the energy of a steam-engine above ground to machinery in the mine. The motor employed was a condensing Watt engine, without expansion, whose efficiency was assumed to be, during the experiment, constantly at 0·60. An intermediate shaft, with pulleys and belts, conveyed the motion of the engine to the generating dynamo.

The distance, 634 meters (691 yards), was represented by two coils of cable, each 604 meters long, and composed of nine copper wires, 1·1 millimeter in diameter, enveloped successively in cloth, in India-rubber, and in lead. The remaining 30 meters (33 yards) were made up by a brass wire 5 millimeters in diameter. The receiving dynamo actuated the winding machinery by frictional contact with the intermediate gearing. The course of investigation adopted was to make a series of observations, by cylinder-diagrams, of the power necessary to drive the intermediate gearing alone at different velocities. This, reduced in the proportion of 10:6, was in each case deducted frem the power (reduced in an equal ratio) required in the various experiments with loads. The balance was taken to be the power transmitted to the generating dynamo, and this is finally compared with the useful work by the windlass in weight raised.

The results obtained are open to the criticism, passed upon them indeed by M. Rossigneux, that they rest upon the assumption of the constancy of the efficiency coefficient of the steam-engine under varying loads; but the results obtained are valuable, as showing the variation in the useful work when other conditions remain fairly uniform, and as qualifying the dogma that, as the work given out diminishes, the efficiency increases. The length of the conductors within the limits of these experiments seemed to have no sensible influence upon the efficiency. When the work to do was small, the efficiency was small, and rose as the work approached in value that for which the machinery was designed. Thus, with the long conductors, when the work utilized was 0·73 horse-power, the efficiency was 17·25 per cent; at 1·15 horse-power, it varied between 26 and 34 per cent; at 2 and 2¼ horse-power, between 40 and 51 per cent; and at 3¼ and 4 horse-power, between 37½ and 51 per cent. With the short conductors, at 1½ horse-power of useful work the efficiency was 28 per cent; and at 2 from to 3 horse-power, it varied from 40 to 51½ per cent.

A French authority gives the following summary of the number of cities in the world possessing telephones, and the number of subscribers:

Europe	161	cities.	30,066 subscribers.
Asia	7	"	420 "
Africa	4	"	240 "
America	186	"	56,090 "
Australasia	5	"	897 "
Total	363	cities.	87,713 subscribers.

The United States leads with 47,960 subscribers, followed by Great Britain with 7287, Italy with 5507, Canada with 5250, France with 4437, and Germany with 3613 subscribers.

CONCENTRATING ORES IN SOUTHWEST MISSOURI.

Written for the Engineering and Mining Journal.

Missouri produced, during the year 1883, 26,000 tons of pig-lead. Of this amount, 11,000 tons were smelted from lead ore mined in the southwestern part of the State, and partly in Cherokee County, the southeastern corner of Kansas. These mines yielded during the same time 57,000 tons of zinc ore, of which 50,000 tons were zinc-blende, and 7500 tons silicate of zinc. Of this amount, 25,000 tons were shipped to the zinc-works at La Salle, Peru, and Collinsville, in Illinois, and the rest went to the zinc-works at St. Louis, Rich Hill, and Joplin, in Missouri, and to Weir City and Pittsburg, in Kansas.

A large number of deposits of lead and zinc ore were opened during the year, and it may be safely stated that this year will witness a greater activity in mining than ever before. These deposits of lead and zinc are found in the Keokuk group of the Sub-Carboniferous limestone formation, and are very irregularly heaped and distributed. As the lead and zinc ore in these deposits is more or less mixed with flint and lime-rock, a marketable product can only be made by separating the lead and zinc from each other and from the gangue. This work is mostly done in a very crude way by pounding the disseminated ore with hammers and separating in Cornish hand-jigs. As this method is a very slow and imperfect one, it is losing ground, and well-constructed concentrating-works take its place. A good many modern plants have been erected during the past few years, and are in successful operation. Many more are projected.

This mining region, like many others, has been infested by patent-right men with patent machinery; but all their attempts and promises have proved failures, and large quantities of their machinery may be found in the rubbish-piles.

The first modern concentrating-works in this region were erected in 1878 in Webb City. Its capacity was 125 tons. Then followed those of the Granby Mining Company, in Lone Elm, near Joplin, and in Oronogo, each of 125 tons capacity. They are similar in construction to those of the Hecla Consolidated Mining Company, in Montana, built lately, and described in the ENGINEERING AND MINING JOURNAL of Deember 9th, 1882, page 306. Afterward, many smaller concentrating-works, most of them from 60 to 75 tons capacity, were built. All these works are well constructed, the machinery used being of the Clausthal or Hartz style. They all use the Blake breaker and crushing rollers for crushing the raw ore. For sizing the crushed material, revolving sizing screens in connection with hydraulic classifiers are used. The usual sizes made by screens are 15, 10, 7, 5, 3, and 2 millimeters; 2 millimeters and less subdivided by hydraulic classifiers into 2, 1, and ½ millimeters. For separating the sized stuff, the concentrators generally use the single Clausthal plunger-jig, in most cases four-sieved. Slide motion is employed for operating the plunger of the jigs for coarser, and eccentric motion for the finer grades. The Rittinger continuous side-discharge is used on jigs for coarser and middle grades—bottom-discharge for the finer ones.

All the slimes are treated on jigs running at very high speed and having very low beds. Besides the single Clausthal or Hartz plunger-jig, a double-acting jig-machine of the same principle is largely used. It differs from the single one in having three or four sieves on both sides of the jig-box, and the plunger compartments in the center. The plunger-rods are forked, and have a plunger on each side. One of these jigs forms in fact two complete three or four-sieved jigs, driven by one shaft. As one of these double jigs does not occupy much more room than a single one, it is possible to have works of large capacity in a small building.

Nearly all these concentrating-works in Missouri are constructed and built by F. De Stwolinski, at present connected with the Fort Scott Foundry and Machine-Works, Fort Scott, Kansas.

COAL MINING IN GREAT BRITAIN IN 1882.

The coal produce of the United Kingdom for the past year is now officially made known. Under the old arrangement, says the *Colliery Guardian*, the returns made to the mine inspectors of the output of coal were kept secret till the presentation of the full details to the Home Office. The Secretary of State has, however, announced his intention of publishing as early as possible statistical abstracts of the whole returns, and thus we are at this early date in possession of some most important information touching the coal trade of the past year. This information is conveyed in six summaries of the statistics for the twelve districts. The first summary shows the number and ages of the male persons employed both above and below ground, and also the number and ages of the females employed above ground, together with the quantity of mineral raised in each of the twelve inspection districts. It appears that 503,987 persons were employed in and about the mines under the coal mines act. Of these, 406,192 were employed underground, and 97,795 (of whom 4652 were females) employed above ground; thus showing, as compared with the respective numbers employed during the year 1881, an increase of 8510. Summary No. 2 gives the mining produce either in districts or counties, by which it appears that 156,499,977 tons of coal, 2,209,036 tons of fire-clay, 11,505,447 tons of ironstone, and 1,119,572 tons of shale, etc., were produced in the mines classed under the coal mines regulation act, including some iron pyrites, etc., found in working these mines, which is given separately in the respective districts. Comparing the above quantities with the output of 1881, an increase is shown in coal of 2,315,677 tons; fire-clay, an increase of 312,129 tons; ironstone, a decrease of 353,319 tons; and an increase of 99,614 tons in the quantity of shale, etc. No. 3 summary contains an account of fatal accidents and lives lost during the year 1882 in and about all the mines under the coal mines regulation act. The fatal accidents amounted to 876, and the deaths occasioned thereby to 1126, showing an increase, when compared with the summary of 1881, of thirty-two in the number of fatal accidents, and an increase of 172 in the number of lives lost. No. 4 summary shows the proportion which the accidents and deaths bear to the number of persons employed and the quantity of minerals raised. It appears that on the average, during the year under review, there was one fatal accident among every 575 persons employed in and about the mines, and one death by accident among every 447 persons employed, and that for each fatal accident 195,586 tons of mineral were raised, and 152,161 tons for each death by accident. During the year 1881, for every 587 persons employed there was one fatal accident, and for every death by accident 519 persons were employed, and for each fatal accident the larger quantity of 200,189 tons were raised, and for each death by accident also the larger quantity of 177,106 tons.

The following table, which we compile from the elaborate returns by districts, gives in detail the causes of fatal accidents and the mortality for the years 1881 and 1882:

	1881.		1882.	
	Number of accidents.	Deaths.	Number of accidents.	Deaths.
Explosion of Fire-Damp	31	116	35	250
Falls in Mine.

THE ORIGIN OF CRYSTALLINE IRON ORES.

At two recent meetings of the New York Academy of Sciences, Dr. Alexis A. Julien and Dr. J. S. Newberry presented papers on the origin of crystalline iron ores, and discussed points connected with the subject. The following is an abstract of Dr. Julien's paper as printed in the proceedings of the Academy:

Theories of two classes have been advanced, referring the origin of the crystalline ores to extraneous and indigenous origin. Under the first class, three may be mentioned:

1. *Meteoric fall*—This was suggested in reference to the huge hematite deposit of Cerro de Mercado, in Mexico.

2. *Eruption as dikes.*—A theory advanced to account for many foreign deposits, and also those of Huronian age in the vicinity of Lake Superior, etc.

3. *Sublimation into fissures.*—A theory founded on the observation of crusts of specular oxide of iron in the lavas of Vesuvius, etc.

Objections to these theories were briefly presented. The theories attributing the origin of crystalline ores to indigenous origin are of two kinds, chemical and mechanical. Several chemical theories have been proposed:

4. *Concentration from ferriferous rocks, or lean ores:* if siliceous, by thermal solutions; if calcareous, by carbonated waters. Sub-aërial processes of this kind can not account for the origin of submarine sediments, such as the crystalline iron ores.

5. *Saturation of porous strata by infiltrating ferriferous solutions.*—Such a process could not produce huge bodies of pure ore, nor the alternation of pure materials in the lean laminated ores.

6. *Infiltration into subterranean chambers.*—The form, lamination, and coincidence with the bedding planes separate the ore-bodies of crystalline character from recent deposits formed in this way.

7. *Derivation from deep-sea deposits.*—The form and structure of the nodules in the ooze differ widely from those of the ores under discussion, while the strata associated with the latter are evidently shallow-water deposits.

8. *The metamorphism of ancient bog-ores.*—This theory, now commonly accepted and taught in all the text-books, is unsatisfactory, from the absence of evidence, within the crystalline strata, of any terrestrial or sub-aërial surfaces on which such bogs or marshes could have rested: all the surfaces appear to be submarine.

9. *Violent abrasion and transport, by volcanic agencies combined with powerful currents.*—To this it has been properly objected that the results of such violent agencies would be altogether conglomeritic.

10. *Concentration and metamorphism of iron-sands.*—Abundant instances of such concentration are shown along our coasts, and the deposits found along the St. Lawrence often contain but five or six per cent of siliceous impurity. As the loose sands so concentrated consist at various localities of quartz, garnet, chrysolite, menaccanite, magnetite, etc., so we find in the metamorphic rocks their indurated counterparts, quartzite, garnetite, dunite, menaccanite, magnetite, etc. The intermixture of garnet with magnetite, or its intercalation in separate alternating beds, is as common in the rocks as in the present oceanic sands. The thin interlamination of magnetite, martite, or hematite with jasper, in the Huronian jasper-schist, corresponds with the still more frequent association now found along our sea-beaches. The abundance of ore-beds of pure magnetite, free from apatite, in the strata of the Lower Laurentian of Ontario, and of menaccanite, more or less mixed with the other ore, in those of the Upper Laurentian of Quebec, Canada, appears to correspond with the general distribution of magnetite grains through the gneisses of the former, and grains of menaccanite through the anorthosites and traps of the latter formation. In bog-ores, no concentra-

Digitized by Google

tion of titanic acid has ever been found; its abundance in the form of menaccanite seems necessarily to involve a mechanical origin, and a vast source of that mineral is presented in its form of fine distribution through the rocks mentioned.

In the discussion, Dr. J. S. Newberry said that he would not claim that the chemical theory best explained the origin of all bodies of iron ore, but he thought it was applicable to most. It was not limited to mere terrestrial deposits like bog-ores, but equally well accounted for marine deposits like the Clinton ore, which in his view was most like the magnetites and hematites of the Archæan rocks. At various places, iron-sands are accumulating on our present coasts, as at Moisé, on the St. Lawrence, on Long Island, and on the coasts of Japan and New Zealand. It is only reasonable to suppose that such accumulations took place in ancient times, and that these were represented in some of the ore-beds now known. The suggestion of Mr. Julien was new and important; but various facts, such as the presence of phosphorus, the absence of foreign minerals, and the retention of limonite structure, seem to indicate that nearly all of our important iron ore deposits had been formed by chemical rather than organic processes.

At a later meeting, Dr. Newberry elaborated his views in a paper of which the following is an abstract:

At a recent meeting of the Academy, Dr. Julien read an interesting and instructive paper on the origin of crystalline iron ores, in which he attempted to show that they are the product of mechanical rather than chemical agencies. In bringing this subject again before the Academy, it is not my purpose to attempt to refute, but rather to supplement and limit, the theory of Dr. Julien.

I will not deny that some of the beds of magnetic iron ore described by Dr. Julien, in the Alleghany belt, have been formed by the sorting power of shore-waves, and that he has made an important contribution to the literature of iron, by his careful study and description of these beds; but that such cases, if they exist, are exceptional, and do not affect the truth and validity of the organico-chemical theory. I shall endeavor to prove by a brief report of some facts which have come under my observation.

The most important deposits of iron ore known to exist in the United States may be grouped as follows:

1. Magnetic ores of the Laurentian rocks of Canada, the Adirondacks, and the Alleghany belt.
2. The Huronian hematites of Lake Superior and Missouri.
3. The crystalline ores of the Rocky Mountains and the Wahsatch.
4. The limonite ores of the Atlantic slope and the Mississippi Valley.
5. The Clinton ores.
6. The carbonates of the Coal Measures.
7. The spathic carbonates of New England, Idaho, etc.

The Laurentian magnetites form lenticular sheets, sometimes more than one hundred feet in thickness, and extending half a mile or more. In many instances, they are inclosed in walls of gneiss, slate, or marble. They often contain much titanium, and have, as almost universal impurities (somewhat vicarious with titanium), pyrite and apatite. Some of the beds are also highly charged with manganese; they usually contain but little silica and alumina, and are the richest of our iron ores.

The characters they present which seem incompatible with the theory of mechanical accumulation are the following: First, their great magnitude, combined with their prevailing purity. Secondly, the large quantity of apatite contained, which we must regard as of organic origin, and therefore supporting the chemical theory, and so different from the magnetite in gravity as to be impossible to be mingled with it by any mechanical agency. Thirdly, the occurrence of great sheets of magnetite between strata of limestone, like the Franklinite ore, or inclosed in layers of limestone and argillite, like the bog-bed at Marmora, Canada. The fact that the slate and the limestone are deposits from deep and quiet water seems incompatible with the view that these strata have been brought into their present association by mechanical means. Fourthly, the frequent impregnation of magnetites with manganese, a material of much lighter gravity, and an almost constant constituent of limonite, goes far to prove such magnetic beds chemical rather than mechanical deposits. Fifthly, the aluminous magnetites, like that of Croton Landing, which contain almost no silica, could hardly have been formed by the agency of shore-waves, which always mingle more or less sand with whatever they deposit.

For these reasons, I must consider the mechanical theory as inadequate to account for the genesis of most of the magnetites of Canada and of the Eastern States.

The specular ores of Lake Superior and Missouri offer objections to the mechanical theory, in both their regularity of deposition and their mineral character. First, they are sometimes interstratified with jasper —once fine siliceous sand—in layers of great regularity and of extreme thinness, a structure which would be the natural product of sedimentation, but hardly of mechanical washing. Secondly, they could never have been deposited as hematite by shore-waves, since this mineral forms an impalpable powder which never accumulates by itself. We must therefore suppose that all these great iron ore-beds are pseudomorphs after magnetite, or that they are the result of sedimentation by organic agencies and subsequent metamorphism.

The iron ore of Iron Mountain is inclosed in "porphyry"—probably a metamorphosed sediment really fused in place; but some of the masses of ore are thickly set with crystals of apatite, which afford an equally conclusive argument against the volcanic and the mechanical theory. In the ore of Simmons Mountain, masses of magnetite occur which retain perfectly their radiated, limonite structure, and there can be no question but that this has been deposited by a chemico-organic process.

The deposits of magnetic iron in Southern Utah—the most extensive of which I have any knowledge—are in places very conspicuously and evenly stratified, and thus exhibit all the signs of having been deposited as sediments. They are associated with limestone and a granitoid metamorphic rock. Along certain lines, the ore is thickly set with crystals of apatite, and some of the largest masses are in great part composed of magnetite, which shows everywhere limonite structure. From these facts, it is easy to see that these great deposits have not been formed by mechanical agencies.

In regard to the sparry carbonates which form vein-stones and the earthy carbonates of the Coal Measures, there can be no question of their origin. They have all been formed by chemical precipitation.

The Clinton ores are interstratified with limestone, form continuous sheets of great extent, and constitute on the whole the most considerable deposits of iron ore in this country. They were apparently formed in the same way that the granular lake ores are now deposited, by the precipitation of iron from solution in a water-basin, surrounded by land having a ferruginous drainage. The quantity of phosphorus they contain, derived from the organic matter deposited with them, is a conspicuous feature in the composition of the Clinton ores, and apparently explains its abundance in many of our crystalline ores. After a careful study of the structure, composition, and surroundings of our most important deposits of magnetic and specular ores, I am compelled to conclude that they have generally been derived from stratified deposits, accumulated by chemico-organic agencies, and once closely resembled our stratified ores of the Upper Silurian and Devonian; and that any beds which accumulated as iron sand on beaches must be rare exceptions to the general rule.

In the discussion, Mr. A. A. Julien pointed out that the theory thus presented by Dr. Newberry was a new one, and might be designated as the "lake-ore theory," in contradistinction to the marsh or bog-ore theory, now commonly accepted. The difference is sharply defined in the following quotations from the *Manual of Geology*, by Prof. J. D. Dana. In his discussion of the Upper Silurian deposits, that author states (p. 231): "The beds of argillaceous iron ore . . . *could not* have been formed in an open sea; for clayey iron deposits do not accumulate under such circumstances. They are proof of extensive marshes, and, therefore, of land near the sea-level. The fragments of crinoids and shells found in these beds are evidence that they were, in part at least, salt-water marshes, and that the tides sometimes reached them." Again he remarks (p. 357), concerning the American continent during the Carboniferous age: "It may have been long a region of barren marshes, and in this condition it might have received its iron ore-deposits, as now marshes become occupied by bog-ores."

In reference to the Laurentian deposits (p. 155), he states: "Limestone strata occurred among the alternations, and argillaceous iron ores, though vastly more extensive." And again, "The argillaceous iron ore has become the bright hematite or magnetite, and it is banded by or alternates with schist and quartz, etc., which were once accompanying clay and sand-layers."

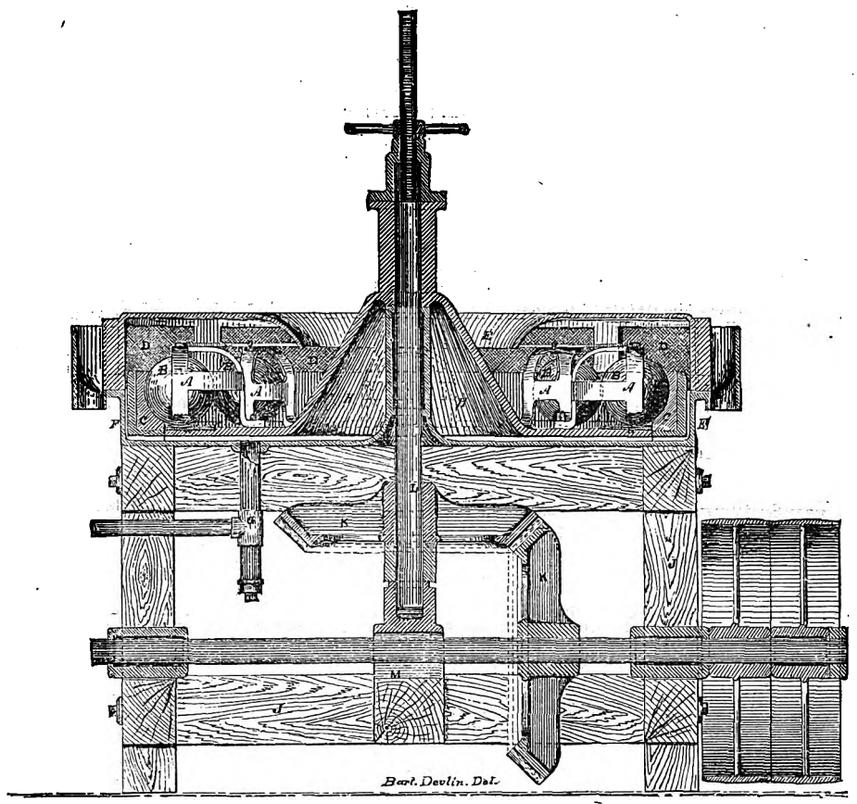
However, it is hard to conceive the growth of crinoids and shells in salt-water marshes, even if reached by the tides, in the free abundance indicated by the crowded organic forms in the Clinton ore-beds, and of these the lake-ore theory presents a more satisfactory explanation. It also well accounts for the origin of the enormous ore-deposits of hematite, of magnetite still retaining a pseudomorphous structure after limonite, and of all iron ores rich in calcium phosphate. This theory is not necessary to account for the presence of pyrite, since the presence of any vegetable matter, for example, algæ growing and decaying in sands or mud, is always likely to produce the deoxidation of sulphates and iron oxide; nor does it account at all for the abundance of titanic acid and alumina in many iron ores.

On the other hand, the mechanical accumulation of iron sands, by agitation of the waves and currents, would appear to account more simply for the smaller but more numerous deposits thickly dispersed throughout the crystalline rocks, varying in size from scattered grains to little flakes and lenses a few centimeters in length, and even thick ore-beds many meters in thickness and diameter. The close association, often observed, of materials of widely different specific gravity—for example, shale and limestone with the magnetic ores—need not appear anomalous, since they may all have a shallow-water origin, deposited by marine currents differing in force and direction at different times. The absence of such mechanical deposits from the sedimentary formations is not established, since even some of the hematites and bog-ores may represent the results of oxidation and hydration of original magnetite sands; while, on the other hand, the huge beds of menaccanite found in Canada and elsewhere, which have not yet found their parallel among the sedimentary strata, may indeed show a certain difference of conditions during the deposit of the ancient crystalline rocks. The comparative regularity of the thin alternating laminæ which make up the ferruginous jasper schists of Huronian terranes appears analogous to that everywhere prevailing in a cross-section of beach sands along our oceanic border; while the mountain masses of this rock, with laminæ of magnetite, or of octahedra of martite after magnetite, or of hematite in triangular scales after martite—all these ores being remarkably free from calcium phosphate—are most simply explained by the accumulations upon a sea bottom, strewn alternately with fine siliceous silt, and with octahedra of magnetite. The presence of manganese oxide in iron ores may often be due, as at the Buckhorn mine in North Carolina,* merely to the decomposition of a manganese garnet originally concentrated as a mechanical sediment, while the concentration of titanic acid and of alumina in many iron ores is perfectly explained by the accumulation of heavy sands of menaccanite, corundum, etc. In a magnetic iron ore of specific gravity 4·5, occurring in serpentine at South Ham, Quebec, Canada, the percentage constitution reported † (Fe 44·69, Cr_2O_3 8·31, TiO_2 21·64) is equivalent to a mixture of three minerals known to occur in iron sands: magnetite 50, chromite 13, and menaccanite, 37 per cent.

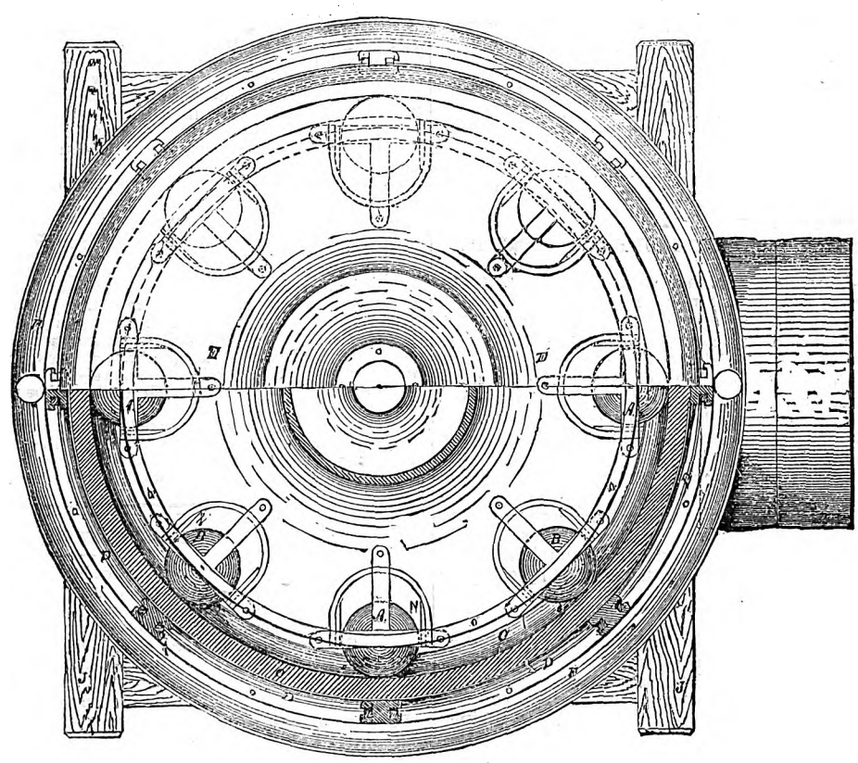
The consideration of these facts would lead to the conclusion that the mode of genesis of a bed of magnetic iron ore may be often determined by the following diagnosis:

When the ore presents structural characteristics allied to those of limonite, or when hematite occurs in included masses, or when the ore contains a notable amount of phosphorus, a chemical origin is probably indicated.

When the ore is almost free from phosphorus or is rich in titanic or chromic acid or alumina, or closely associated or mixed with granular garnet or olivine, a mechanical origin may be inferred.



Mr. N. F. Darton stated that he had found over two per cent of chromic acid in the limonite ores of Staten Island, and Mr. N. L. Britton, from 1·6 to 3 per cent in the ores of the same region.



* W. C. Kerr, Geology of North Carolina, 222.

THE MOREY PULVERIZER FOR WET CRUSHING.

In our last issue, we described the pulverizer for dry crushing recently brought out by the Morey & Sperry Mining Machinery Company, which we erroneously designated as a modification of the Howland pulverizer. We illustrate this week the wet pulverizer, working on the same general principle, the object being to reduce the friction and the loss of motion in the earlier machines of the same general type, and at the same time to overcome the mechanical difficulties of other constructions with which it has some features in common. The attrition of the material is brought about by the impact of the balls, propelled by centrifugal force and moving freely in their guards against the concave annular ring. The latter is 2¼ inches thick, and weighs about 900 pounds; the principal wear, however, being on the balls, the ring, we presume, being to some extent protected by the ore forced by the rotation of the machine against its inner surface. Water is carried from below through the pipe *G* into the machine, the pulp being discharged through an ample screen surface *D* into gutters.

SECTIONAL PLAN.

Three sizes of machines are made: No. 1, having a ring five feet in diameter; No. 2, three feet; and No. 3, two feet. In the largest size, which we illustrate, eight balls, each weighing 70 pounds, are used. For the two others, the number of balls is respectively six and four, the corresponding weights being 47 and 20 pounds. When running at a speed of 200 revolutions per minute, the five-foot machine has an estimated capacity of from 1 to 1·5 tons of ordinary quartz through a 40-mesh screen, and requires from 12 to 15 horse power; while the three-foot pulverizer, it is estimated, puts from 0·5 to 0·75 ton through the same screen, with an expenditure of 8 horse-power, the rock being previously crushed in a breaker to about one half or three quarter inch size. The pulverizers use from 1000 to 1200 gallons of water per ton of rock, and weigh respectively, No. 1, 7000 pounds; No. 2, 3000 pounds; and No. 3, 1000 pounds; the weight of the heaviest part of the two larger sizes being 950 and 500 pounds respectively.

The operation of pulverizing is the same in wet as in dry crushing, the modifications of detail being such that facility of getting at and exchanging screens, balls, and the ring are provided.

A New Coal-Cutter.—An item is going the rounds of the press to the effect that an ingeniously contrived device for coal-cutting has been introduced in England, the machine being, practically, a combination of inclined circular saws mounted upon a revolving rod, so that the groove cut by each saw runs into the groove cut by the next, thus thoroughly undercutting a seam. The saws are set on the rod obliquely, provision being made for retaining them at a proper distance from each other, and in the most suitable position on the rod, the end of which has a screw thread cut upon it, by means of which it is fastened into the spindle and bearings. In another form, the cutting apparatus is made from a flat bar of steel, with saw teeth along both of its outer edges, and so twisted that the toothed edges are formed into spirals. By this arrangement, the cutter readily clears itself from the slack which it cuts away. The cutters can be driven either by hand power or by compressed air, as may be desired.

THE COKE INDUSTRY.

Mr. Joseph D. Weeks, of Pittsburg, Special Agent of the Census Bureau, three or four weeks ago completed and filed with the proper authorities his report of the coke industry. This report is believed by Mr. Walker, Superintendent of the Census, to be the first one ever made officially on this subject; and, we may add, it will constitute the first complete report of any kind ever published on the subject. We give herewith a brief summary of the report. The original report gives the States in detail, dividing them into counties where manufactories exist.

There are 149 coke establishments in the United States, representing a capital of $5,545,058. The industry gives employment to 3142 people, 3068 of whom are males above sixteen years of age; 3 females above fifteen years; and 71 children and youths. The total amount of wages paid during 1880 was $1,198,654. During this year, 4,360,110 tons of coal were used, costing $2,761,657. The value of other material used was $233,784; total value, $2,995,441. Total amount of coke produced during the year, 2,752,475 tons; valued at $5,359,489. The coke establishments are distributed in ten States, as follows: Alabama, 4; Colorado, 1; Georgia, 1; Illinois, 4; Indiana, 2; Ohio, 15; Pennsylvania, 104; Tennessee, 4; Virginia, 2; West Virginia, 12.

The four establishments in Alabama represent a capital of $13,500; hands employed, males above sixteen years, 64; paid in wages in 1880, $38,500; materials, coal, 67,376 tons, valued at $75,314; value of other materials, $1304; total value, $76,618; total amount of coke produced during the year, 42,035 tons, valued at $148,026.

Colorado's one establishment has a capital of $150,000, and employs 75 hands, all males above sixteen years. Wages paid in 1880, $13,500; materials, 29,500 tons of coal, valued at $29,500; value of other materials, $600. Total values, $30,100. Total amount of coke produced during the year, 18,000 tons, valued at $90,000.

The one establishment in Georgia has a capital of $80,000, and employs 107 hands, all males above sixteen years. Wages paid in 1880, $13,837; materials 117,000 tons of coal, valued at $120,000; value of other materials, $4900; total value, $124,900. Total amount of coke produced, 70,000 tons, valued at $140,000.

The four establishments in Illinois represent a capital of $205,000; hands employed, 1670, and all above sixteen years except two children. Wages paid in 1880, $9347; materials, 15,000 tons of coal, valued at $15,000; value of other materials, $420; total value, $15,420. Total amount of coke produced during the year, 76,000 tons, valued at $124,000.

Indiana's two establishments represent a capital of $80,000; hands employed, four, all over sixteen years of age, all males. Wages paid in 1880, ——; materials, 1500 tons of coal, valued at $2025; value of other materials, $200; total value, $2225. Total amount of coke produced, 1000 tons, valued at $3000.

Ohio's fifteen establishments represent a capital of $144,012, and employ 153 hands, 150 males above sixteen years, and three youths. Wages paid 1880, $51,977; materials, 193,848 tons of coal, valued at $228,482; value of other materials, $5399; total value, $233,881. Total amount of coke produced, 109,296 tons, valued at $334,546.

Digitized by Google

Pennsylvania leads them all. Her 104 establishments represent a capital of $4,262,525, and employ 2444 hands, 2379 of whom are males above sixteen years, three females above fifteen years, and 62 children and youths. Wages paid in 1880, $983,431; materials, 3,608,095 tons, valued at $2,031,305; value of other materials, $209,849; total value, $2,241,154. Total amount of coke produced during the year, 2,317,149 tons, valued at $4,190,136.

The four establishments in Tennessee represent a capital of $200,021, and employ 114 hands, all males above sixteen years. Wages paid in 1880, $38,820; materials, 179,311 tons of coal, valued at $124,137; value of other materials, $8092; total value, $132,229. Total amount of coke produced, 91,675 tons, valued at $212,493.

The two establishments in Virginia, representing a capital of $30,000, were not operated during 1880.

The twelve establishments in West Virginia represent a capital of $330,000, and employ 163 hands, 159 males above sixteen years and 4 youths. Wages paid in 1880, $48,952; materials, 148,480 tons of coal, valued at $135,944; value of other materials, $3020; total value, $138,954. Total amount of coke produced, 95,720 tons, valued at $216,588.

Since the publication of Mr. Weeks's figures in the Census Compendium, the Secretary of Internal Affairs of Pennsylvania has printed his statistics for the coke industry in that State for the year 1882. His total shows a product of 3,216,544 tons of coke from 10,063 ovens. Fayette County leads, with 5522 and a product of 1,764,585 tons; followed by Westmoreland, with 3281 ovens and 1,075,305 tons. Somerset County reports 209 ovens and 64,525 tons; Huntingdon County, 200 ovens and 49,232 tons; Alleghany County, 159 ovens and 24,562 tons; Cambria County, 119 ovens and 39,438 tons; Blair County, 88 ovens, and 36,032 tons; and Clearfield County, 86 ovens and 20,281 tons.

THE DEPOSITION OF GOLD BY CHARCOAL.

In a long paper on the use of charcoal for precipitating gold from chlorine solutions, Mr. William Morris Davis, the patentee of the process, gives the results obtained during six experimental runs in the chlorination-works at the Yadkin mine, near Salisbury, N. C. Our attention has been called by a gentleman who carefully examined the figures to some slight errors in calculation and one important misprint. We give the tables as corrected:

Number.	Tons worked.	Assay per ton.	Value of ore.	Gold, mint returns.	Compared with assay.
1	17½	$11.90	$208.25	$216.33	+ 46 cts.
2	30½	11.90	362.95	383.34	+ 67 "
3	9	25.20	226.80	237.99	+ 124 "
4	559	3.61	2,017.99	2,802.00	— 67 "
5	265	5.04	1,335.60		
6	1,082	7.25	7,844.50	7,513.16	— 30⅝ "
	1,963	$6.11	$11,996.09	$11,152.82	— 43 cts.

Mr. Davis, on page 285 of the Franklin Institute *Journal*, where his paper is printed in full, gives the following statement of cost of the process, labor, and other charges in a single filter:

Fourteen bushels charcoal at 5 cents	$0.70
Grinding and screening, ½ day at 60 cents	.30
One boy, regulating flow, 4½ days, at 25 cents	1.12½
One man burning coal, one day, 60 cents	.60
Reduction by crucible, fluxes, etc	1.50
Total, 80 tons	$4.22½
Or per ton	5·3c.

This, of course, is based on very low prices for labor and material.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

Alabama Mineral Lands.—In view of the passage at the last session of Congress of a bill "to exclude the public lands in Alabama from the operation of the laws relating to mineral lands," the Secretary of the Interior has written to the district land officers in Alabama in part as follows: "In order to carry out the provisions of said act, it will be necessary to prepare a list of all public lands heretofore reported as mineral that have not been entered, and have them offered by President's proclamation. In the mean time, you will be careful not to allow an entry to be made for any lands lists of which were transmitted to your office October 23d, 1879, nor of other tracts that have been since investigated and reported as valuable for minerals. All existing *bona-fide* entries under the homestead laws may be perfected, regardless of the mineral character of the land. Any contest pending before you, where the *only* allegation is the mineral character of the land, must be dismissed. The law requires the offering to embrace all lands heretofore reported as containing coal or iron that remain undisposed of by entry or sale."

THE PULSOMETER IN GERMANY.—Herr Bartling, of Hanover, Germany, has communicated to a local society the results of a series of tests made with a pulsometer somewhat modified in construction. There is a special air-valve, which, by providing for a stratum of air between the water and the steam, reduces the condensation of the latter. In lifting to a hight of 32·81 feet, and running at 42 pulsations a minute, the water was heated only three degrees Celsius, in the old German style; while with the Ulrich modified pulsometer, it was heated only 1·5 degrees when running at 72 pulsations, and used about 5·5 pounds of steam to every 35·35 cubic feet of water delivered. In making comparative tests between pumps and the pulsometer, one kilogram of steam did 1800 kilogrammètres of effective work in the pumps, and 2560 kilogrammètres in the pulsometer, although the steam was moist, and the test was therefore disadvantageous to the latter. The greatest lift admissible for this pulsometer is given as 39·4 feet; but the maximum effect was obtained with 9·8 feet. The lift, of course, depends upon the steam pressure. High lifts, however, may be obtained with low-pressure steam by using several pulsometers one above the other. Thus, three of them delivered to a hight of 344·5 feet with steam of 4·5 atmospheres pressure. Horizontally, the suction-pipes may be carried as far as 900 feet.

FURNACE, MILL, AND FACTORY.

The Deane Steam Pump Company, of Holyoke, announces that it has secured a warehouse at Nos. 620 and 622 North Main street, St. Louis, Mo., from which it will make punctual distribution of its machinery to the Southwest, where its business has largely increased.

The Niles Furnace, at Niles, Ohio, has been leased by the Arnold Furnace Company for a term of years. The plant will be used in the manufacture of a special brand of iron, particularly adapted for stove plate and light machine castings.

Chicago claims to have 266 establishments engaged in the manufacture of iron, of which 8 are barbed wire works, 15 wire works and wire-cloth works, 28 machinery manufactories, and 4 car-wheel works. Capital invested, $17,400,000; workmen engaged, 18,600; value of product, $45,255,000.

The Scranton Steel Company, of Scranton, as we are informed by the president, has not yet started. It has merely been making a few preliminary heats, to test various points in connection with the works. It will be some time before it starts.

A representative of some of the principal mines in Chili recently visited San Francisco for the purpose of familiarizing himself with the improvements in copper smelting on the coast. After a thorough investigation of the whole matter, an order was placed for one of the Pacific copper smelters of Rankin, Brayton & Co., of San Francisco and Chicago, with the assurance that, if such results are obtained in Chili as are given in this country, they will adopt them for their whole system of working.

The St. Louis Furnace Building and Construction Company is getting out plans for two Siemens heating-furnaces and eight gas-producers for the new mill of the St. Louis Bolt and Iron Company at East St. Louis.

Capt. C. Hinsdale, general Western agent for the Berryman feed-water heater, has taken an order for a No. 5 heater from the Allouez Mining Company, of Allouez, Mich., and one from the Saginaw Mining Company, Saginaw, Mich.

Among the improvements to be made at the mill of Summers Brothers & Co., of Youngstown, Ohio, this spring, will be the erection of another set of sheet-iron rolls, a box-furnace for annealing iron, a scrap-furnace, and a set of new boilers.

Stokes & Parrish, of Philadelphia, are now turning out an unusually large amount of work in their particular line, and though they have enlarged their works considerably during the past two years, they are taxed to their fullest capacity. Among orders recently entered, we mention a furnace hoist, with its complete outfit, for the Everett Iron Company, whose furnace is at Bedford. The same company was supplied with a mining hoist for a 200-foot shaft. The firm has also just completed a furnace hoist for the Woodward Iron Company, at Wheeling, Jefferson County, Ala., and one for the Shenandoah furnace, at Milnes, Page County, Va. Considerable activity is also displayed in turning out hydraulic passenger elevators.

It is understood, says the Portsmouth *Register*, that the contracts for building the Kelly nail mill were let last week. The Messrs. Kelly state that the enterprise has reached a point of assured certainty, and the work will be pushed forward to completion as rapidly as possible. The contracts, we learn, were awarded to some three or four parties, with a view to securing the completion of all the work at the earliest moment, by dividing it. It is estimated that the machinery and other iron work will be on the grounds inside of *six* months. Messrs. Lambert Brothers have been awarded the contract for a portion of the work, which they expect to finish in half that time. The nail factory will have room for 120 nail machines, 60 of which will be put up at the start.

The Link-Belt Machinery Company has just shipped to the Patent Asphaltum Company, of Sydney, New South Wales, a car-load of link-belting and wheels and elevators for handling lime and crushed stone. The first-named company has also shipped a large quantity of belting to the Forest Fiber Company, of Berlin Falls, N. H., and lately placed two more sawdust conveyers in the mills of the Berlin Mills Company, of Berlin Mills, N. H., an elevator for handling shot in the works of Merrie, Verhage & Co., Cincinnati, Ohio, and a bran-conveyer with 160-foot centers and a capacity of 1000 pounds per hour, in the establishment of Robison & Co., Maysville, Ky. It has also orders for three conveyers and one pulp-elevator for the Hudson River Water-Power and Paper Company, of Mechanicsville, N. Y.

The Ryse Manufacturing Company, Indianapolis, Ind., is putting the machinery into its new shop to manufacture drop-forgings, pipe-wrenches, pipe-stocks, and dies.

The Ohio Powder-Works, of Youngstown, has completed its plant, and is turning out 250 kegs of powder per day.

The McTighe Electric Light and Manufacturing Company, capital $300,000, will erect a large manufactory in Pittsburg, Pa. Among the incorporators are F. B. Laughlin, of Jones & Laughlin, William N. Riddle, of the Pennsylvania Bank, Matthew McMullen, J. M. Patterson, and Thomas J. McTighe.

The Lechner Manufacturing Company, of Columbus, Ohio, has sent ten coal-cutters to the Pratt mines, at Birmingham, Alabama.

Messrs. Shields & Brown, manufacturers and sole proprietors of Bradley's insulated air-coverings for boilers, steam, gas, and water-pipes, are removing to new and more commodious quarters, at Nos. 78 and 80 Lake street, Chicago. By reason of the adoption of entirely new and improved machinery in their manufactory, the quality of their goods will be much improved, being finished up in better style than heretofore.

Henry R. Worthington, the well-known pump manufacturers, announce that on May 1st they will remove to their new stores, Nos. 86 and 88 Liberty street, in this city, and on the same day will transfer their St. Louis office from No. 707 Market street to No. 419 North Third street.

GENERAL MINING NEWS.

ARIZONA.

At the annual meeting of the Total Wreck Mining Company, held in this city, the following gentlemen were elected for the current year: John W. Shaw, President; A. E. Outerbridge, Vice-President; J. M. Requa, Treasurer; Edward Annan, Charles Spear, William H. Power, Walter L. Vail.

CALIFORNIA.

HOMER DISTRICT.

During the past winter, work, with the exception of a limited amount of prospecting, was entirely suspended in the district. Heretofore it has not been deemed expedient to attempt the working of the mines during the winter months, and until the present year the resumption of operations before the middle of May or June has been impossible. But this season, the mildness of the weather has made it possible to make an early start. There are numerous properties in the district that show up well, and many prospects are lying uncovered, whose owners are unable, from lack of financial backing, thoroughly to develop their mines.

INYO COUNTY.

A correspondent of the Inyo *Independent* says that the Defiance mine was located in the latter part of 1874. Two 30-ton furnaces were erected at a distance of three quarters of a mile from the mine, and were run for about a year at a loss to the owners. This was due principally to the high cost of transportation and the depreciation in value of lead. The cost of transportation then amounted to $80 per ton from and $47 per ton to San Francisco. The rates of freight are now much less, and for the past two years the mine has paid well. It has been worked to the depth of 212 feet, 500 feet in length, and 60 feet in

Digitized by Google

width. The company (known as Reddy, Gorman & Co.) proposes to carry this working down to the depth of 600 feet as speedily as possible. The facilities for doing this are good. The total yield of ore from the mine up to the present time is 18,000 tons, which produced 3500 tons of bullion—5·10 tons of ore producing one ton of bullion. The average value of the bullion has been $200 silver and $6 gold per ton. One notable fact is worthy of observation: The ore in the lower workings is of much higher grade than near the surface, carrying a larger per cent of both gold and silver. Assays have been made that gave a result of 820 ounces silver and $175 gold per ton. It is not the intention of the company to run its furnaces until August, as it prefers waiting until the railroad is completed to Owens Lake and thereby secure cheaper rates for the transfer of bullion. Nearly all the ores in the Defiance mineral belt contain gold. To the north of and adjoining the Defiance is the Cuervo mine. A fine-looking ledge of copper has been lying vacant for years but a short distance from Darwin. A location has now been made upon it, and the ore exhibited is of high grade, principally red and black oxides, assaying from 30 to 60 per cent copper.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—There were only 81 tons of ore hauled to the mill during the week ended the 31st ultimo, the snow-storm having interfered with transportation. The mill crushed 126·24 tons. The average assay value of the pulp was $32.95 per ton; that of the tailings was $5.02.

PLUMAS COUNTY—GREENVILLE DISTRICT.

TAYLOR-PLUMAS.—A dispatch to the New York *Tribune* states that the mill is running well. We are having a big rain and snow-storm. Outlook most encouraging. The secretary of the company says: The mill has been in operation since March 15th, and we may now look for a clean-up any day.

CANADA.

The abundant deposits of apatite in the Laurentian rocks of Canada are at present receiving the attention of investors. In Ottawa County in the Province of Quebec, preparations are making for extensive mining by the Union Phosphate Land and Mining Company, composed chiefly of Philadelphians. The property of this company was formerly owned by Mr. Preston, one of the pioneer phosphate miners. It is well selected, and will probably prove one of the best mines in the district. Application has been made to the Ontario government for incorporation, under the joint-stock company act, of the Northern Ontario Phosphate Land and Mining Company, by New York parties who own some very valuable tracts in the county of Renfrew, Ontario. The average analysis of several specimens taken from different beds or veins in this county shows 83·4 per cent bone phosphate of lime. The width of the veins, which are numerous, varies from 18 inches to six feet solid apatite. Another company is forming for the purpose of working some large deposits of apatite which have been found quite recently in the same county. The increase in shipments of phosphate to the English markets the coming season will be very large, and notwithstanding this, the great demand for high-grade apatite will, it is believed keep the price up. Prices quoted now in Liverpool and London are one shilling and five pence per unit for 80 per cent, the ruling price in Montreal being from $22 to $25 per ton. Considerable English capital, and not a little American, is going into this branch of industry, which certainly recommends itself.

At Charleston Lake, in the county of Leeds, large deposits of metallic oxide of iron have been discovered. Parties interested in the manufacture of mineral paint are examining them. A fine quality of specular iron ore has been discovered near Brockville in the same county. The Dominion government has provided in its recent changes of the tariff a bounty on pig-iron of $1.50 per ton for three years and $1 for the succeeding three years. This is done as an incentive to the establishment of furnaces. Brockville is considered one of the best locations in Eastern Ontario for a furnace. Its shipping facilities are second to none. There is railroad and water connection from all points; specular and magnetic ores in close proximity; and the country to the north is well wooded, so that an almost inexhaustible supply of charcoal can be had.

PROVINCE OF MANITOBA.

CANADA.—The shaft, recently started, is down eight feet. The vein, from present indications, has a scattered appearance, being divided into numerous small feeders, but so far no well-defined lode. Several pieces of rich-looking rock have been taken out, but the vein has no uniform character. At the bottom of the shaft, there are about two feet of antimonial iron, which carries a small percentage of silver.

WINNIPEG CONSOLIDATED.—The mill has begun crushing ore, and works satisfactorily. Arrangements have been made for the addition of five more stamps, and it is expected that they will be in operation within six weeks.

COLORADO.

BOULDER COUNTY.

We are in receipt of the following letter:

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In common with several other mining districts, Boulder County is enjoying (?) its semi-occasional "excitement." The Jamestown rush has already assumed larger proportions than any thing of the kind in the past history of the county, though, to blurt it right out, no new discoveries have been made that are paying.

Jamestown has had existence as a tenth-rate mining camp for about seventeen years. It is in the "telluride belt," though the new strikes are said to be of the character of the Leadville carbonates. The village is fourteen miles west of the thriving town of Boulder, which is the distributing point for the dozen mining camps of the county. Hitherto all that has kept the camp up has been the Golden Age mine, and some spasmodically-worked telluride veins.

Hayden, in his geologic map, puts all this foot-hill country under the head of "Metamorphic Rocks," and in his Report says nothing of eruptive rocks or sedimentary deposits existing in this region. There is, however, at Jamestown an apparent "blanket" formation, or something of that nature; for in the Buckhorn, Argo, and many other shafts, a supposed horizontal bed of low-grade lead ore has been struck. As yet no walls have been found, and the dip is uncertain. After sinking through a few feet of soil, in most instances alternate strata of yellow and red sand and clay are passed through, until, at from twenty to forty feet, the lead ore is met with. Out of a large number of assays made by one gentleman, the highest gave $37, and the next best $12 in silver ore. Returns of more than $100 per ton are, however, said to have been made for several lots of the ore shipped to the sampling-mill.

This, then, is the foundation upon which the "Second Leadville" is to be built, and in truth, at the present rate of increase, there will soon be people enough on the ground to make a city out of the hitherto quiet little community. Already the little eddy of two months ago has widened and deepened into a grand whirlpool of three thousand people.

The writer has passed through a number of similar experiences, and this is simply a repetition of the old story: Hills covered with survey-stakes, roads leading to camp crowded with people, hotels overflowing, saloons and keno "doing a land-office business," lots "sky-high," dance-houses building in hot haste, and every body excited except a few old settlers, who go about in a dazed way, and wonder what it is all about.

In a country full of veins of ore, it would be a marvel if not one among thousands of prospectors should discover any thing of value, and good finds will doubtless be made—possibly before this reaches you; but so far, nothing has been struck to warrant the excitement.

Meanwhile, other parts of the county are producing considerable ore of good grade. The tellurides have not "petered out" yet. Such mines as the Slide, Emancipation, Prussian, Inter-Ocean, Ingram, Keystone, Smuggler, and Cold Spring are almost daily shipping ore which runs—first-grade, from one to twenty thousand dollars per ton; second grade, from two to eight hundred; third grade, from sixty to two hundred; while the poorest part is successfully concentrated on Frue vanners.

For economy and facilities for working, for climate, for fuel, and for the advantages of civilization, Boulder County certainly surpasses any other mining district of the State of Colorado. It is remarkable, too, that the ores of almost all the other counties are represented here. Clear Creek and Gilpin mines have something like counterparts in Caribou and Ward; San Juan resembles that of Camp Albion; and Jimtown *may* turn out "carbonates." In the production of tellurides, however, Boulder has a monopoly, and the patent right covers not only this State, but the whole country; the Bassick mine and the California tellurium mines not yielding enough to mention in comparison. From the fact that, only five years ago, Professor Dana himself was ignorant that such tellurides as calaverite, sylvanite, petzite, etc., were mined in the United States in quantity, it is probable that comparatively few mineralogists are aware that to-day, in Boulder County, not less than fifty mines are producing such ore, or are capable of yielding it.

The report of the State Geologist for 1881 and 1882, just issued, gives a list of 246 minerals found in Colorado; of the fifty which are gold and silver-bearing, thirty-five are mined in Boulder County, the remaining fifteen being for the most part rare and commercially unimportant.

The two narrow-gauge railroads now building up Boulder and Four Mile and Left Hand cañons will touch at or near most of the mining camps before summer. The former is already running a construction train to within a few miles of Caribou.

THOMAS L. WOOD.

BOULDER, COLO., March 24.

CHAFFEE COUNTY.

STONEWALL.—The main shaft is sinking at present; and from the depth of 150 feet to the bottom of the shaft, 165 feet, the streak of good ore has widened from two inches to two feet, showing an increased percentage of copper, which indicates a higher value per ton in silver. The vein, fully thirty feet in width, carries an excellent quality of low-grade galena running from twenty-five to forty dollars per ton, and is all susceptible of successful concentration. While the ore is not entirely free from refractory elements, it is believed that it can be successfully treated on the spot.

CLEAR CREEK COUNTY.

The Colorado *Miner* gives the following as a portion of the ore-shipments from Georgetown during the month of March:

Boston & Colorado	440 tons.
Silver Plume sampling-works	130 "
Miners' sampling-works	70 "
Mendota mine	58 "

The Boston & Colorado agency paid out $57,559 during March for ore.

ATLAS.—The new low-grade ore-mill at Empire Station started up April 1st, and has been working successfully. The present capacity is from twenty-five to thirty tons daily, which will be increased to 200 tons if developments justify it.

GARFIELD COUNTY.

A correspondent of the Leadville *Herald*, in speaking of the Defiance Mining District, which is at present attracting so much attention, says: Fifteen miles of the approach to this camp must be made on snow-shoes, where the snow is at present from six to eight feet in depth. No prospecting can be done here for from six weeks to two months; prospectors who arrive here before that time can do nothing. There are at present about a dozen men in the camp, some of whom will go out within a few days. The formation here is limestone. Half a dozen mines or prospects are worked which all show well. The ore is a hard carbonate and galena, which is low grade and free smelting. The deepest shaft, and the only one of any depth that is worked at present, is seventy feet in depth. It is claimed by parties familiar with the camp that carbonate float can be found over an area of several miles around the mines that are now working. The best ore I have seen was a genuine carbonate of lead taken from a claim three miles from Carbonate City. The ore lies in perpendicular veins as far as development has yet proved. Prospectors and parties acquainted with the surrounding country claim that the limestone is only a cap-rock about two hundred feet thick, which lies on quartzite, the evidence of which can be seen in deep cañons which lead to the Grand River.

GILPIN COUNTY.

The placer mines along North Clear Creek and in Russell and Lake gulches are beginning operations for sluicing.

KEYSTONE.—The lessees are prosecuting development-work, and are gradually opening up a large amount of ground which will be removed by back-stoping. There are four shafts down at intervals along the vein, having depths of from 40 to 115 feet. The mill-dirt treated at Colonel Randolph's stamp-mill in Black Hawk is averaging 4 ounces gold per cord. It is estimated that there are probably $15,000 or $20,000 ore in sight.

KING.—Sinking will be resumed as soon as the machinery has been arranged. The shaft is to be continued on down 100 feet deeper, before driving any more levels.

ROLLINS.—Preparations are making to drive the lower cross-cut tunnel under Perigo Mountain, from its present heading. The company has a fine plant of air-compressors and power drills on the ground, which will be used instead of the slow method of hand-drilling.

WILLIAMS.—This mine, the property of the Gilpin County Mining Company, has improved lately, the mill-dirt averaging over 5 ounces gold per cord. Sortings from the old dump-pile are sent to the stamp-mill, yielding a good profit.

GUNNISON COUNTY.

GUNNISON.—Sinking is going on on the vein of the Comet lode. The shaft is about seventy-five feet below the tunnel level, making a depth of over 140 feet from the surface. The quartz or pay-streak is about eighteen inches wide, which shows some brittle silver. The quartz is crystallized, containing some white iron, and indications are very favorable for striking a body of mineral. The water is coming in very fast, caused by the snow melting. It is very probable that work will be suspended for a while on that account.

HINSDALE COUNTY.

CROOKE'S SMELTING-WORKS.—The smelter has been shut down for a limited period. Mr. H. W. Geist, of the Pueblo Smelting and Refining Company, has recently examined the Ute and Ulé ores, and as his works needed the lead which these ores contained in such rich proportion, he made an unusually flattering offer for them, which resulted in a contract to deliver 20 and 25 tons per day of the concentrates. This will take the present output of the concentrator. But it is expected that, when sufficient water can be had to run the concentrator full time and capacity, there will be a large excess over this amount, which will be treated here unless other arrangements should be made, in which case it is hoped that the smelter can be started again. It will not, however, be started until it is certain that sufficient ores can be had to guarantee a steady and uninterrupted run. The mines are in fine condition. The recent rich strike in the seventh level, west, of 2½ feet of mineral carrying largely gray copper, is not only encouraging but gratifying. The stopes in both the Ute and Ulé are yielding largely.

Digitized by Google

LAKE COUNTY.

Late Leadville exchanges contain the following product for the quarter ended April 1st:

Arkansas Valley	$485,562
American Mining and Smelting Company	333,040
A. R. Meyer & Co.	381,221
Shields Mining and Milling Company	18,000
Harrison Reduction-Works	467,694
La Plata Mining and Smelting Company	636,584
Tabor Milling Company	33,275
Grant Smelting Company	779,512
Leadville Gold and Silver Milling Company	46,410
Cummings & Finn	480,363
Other sources	1,000
Total	$3,662,662

The value of silver is taken at $1.10½ per ounce; gold, at $20 per ounce; and lead, at $92 per ton, or 4·6 cents per pound. The basis of computation throughout 1882 was silver at $1.14 per ounce and lead at 5 cents per pound. To the depreciation in the price of these metals may be chiefly attributed the falling off from the product the first quarter of last year.

ÆTNA.—A large body of excellent fluxing iron has been opened up in this mine on Carbonate Hill. It was encountered in running a level from the Chadbourne shaft at a depth of 250 feet, and an uprise of thirty feet and a winze forty feet in depth have failed to show its top or bottom. Although low-grade in silver, this iron is of excellent quality for fluxing. In the old workings, a body of high-grade ore, similar to that found in the north shaft, has been struck, from which some very satisfactory shipments have been made.

BROOKLAND.—The shaft has attained a depth of 500 feet, and has passed through sixteen feet of mineral. The shaft being clear of water, drifting upon the mineral will begin.

MILES-AUGUSTA.—The lessees are at present working on a body of mineral which was opened recently in the ninety-foot level. The assays show that the iron carried 16 ounces in silver while the sand specimen returned 18 ounces in silver and 41 per cent of lead. The shaft is 250 feet deep, and is free from the water annoyance. Shipping will be commenced shortly.

M. R.—This company owns several mines on Mount Elbert, prominent among which are the M. R. and Boulder claims. Considerable development has been carried on for some time, and the building of a fine ten-stamp mill and concentrator at Twin Lakes has just been completed. Large contracts for ore have been lately closed, so that an abundance of mineral for treatment at the mill is assured.

ONLY CHANCE.—This mine, which is located in California Gulch, and which is operated under a lease, is now producing from twelve to fourteen tons of mineral per day, which carries about ten ounces in silver and forty per cent of lead. There is a 350-foot shaft, with a west drift of 60 feet, an east drift of 75, and a north drift of 50. Shipments are now made from the upper levels.

SUMMIT COUNTY.

FELICIA GRACE.—A vein four feet wide was recently opened up in the old incline. The workings heretofore have been mainly on the surface, as the vein was lost at a certain depth.

WHEEL OF FORTUNE.—Regular shipments are made from this mine. From three to seven car-loads are shipped every day. Heavier shipments will be made as soon as the roads are in proper condition.

DAKOTA.

BLUE LEAD.—A forty-ton smelter has been ordered and will be put up shortly. The ore uncovered thus far will yield, it is stated, at least 40 per cent copper.

CALEDONIA.—The mill is running sixty stamps on $7 ore, yielding a net profit of $5.50 a ton. The lower winze is steadily sinking, with no change in the general good character of the ore-body.

DEADWOOD HYDRAULIC COMPANY.—This company owns all the valuable placers but one in Deadwood Gulch. Last winter, it constructed a magnificent and costly bed-rock flume, purchased rights of way and much material preparatory to extensive work by the hydraulic process. Operations, however, have been delayed by the action of the owners of the excepted claim, who obtained an injunction restraining the company from taking water from its reservoir above the excepted claim, to the deprivation of the owners of the latter. This procedure is considered a sort of blackmail, as the claim has been worked repeatedly, and is pronounced barren.

ESTRELLA DE NORTE.—This property is in a good shape for an early resumption of work and a prosperous season. Its ground on Castle Creek was found rich wherever worked; but owing to depth of bed-rock and a superabundance of water, it has been only superficially prospected.

FATHER DE SMET.—The superintendent's report from March 23d to April 1st shows: Ore extracted from first, second, and third levels, 2950 tons. Ore milled, 3000 tons. North end tunnel in 856 feet. Third level header in 177½ feet. Golden Gate North header in 55 feet. West cross-cut in 27 feet. Third level header connected with Italian winze.

ORO CACHE.—This company, which owns promising and well-developed locations on Spruch Gulch, contemplates the erection of a mill at an early day, but has not decided between a 40-stamper at the mine, where water is limited, or a 120-stamper on Whitewood, at the mouth of Spruce Gulch, 1½ miles distant. The latter will doubtless be agreed upon, in which event a narrow-gauge railroad will connect mine and mill.

ORO FINO.—At present, there is no prospect of an early resumption of work. It is understood that the company has decided to put up hoisting-works, in accordance with the recommendation of the superintendent. If it does, the mill may possibly start up by the 1st of July.

SAM.—A vein of quartz was recently discovered, which in richness is said to exceed any thing that has heretofore been found in the mine.

THE HERMANN O'BRIEN & WARDNER COPPER COMPANY.—A smelter of thirty tons capacity has been ordered, and will probably be put in blast about the end of May. The ores of this mine are carbonates and oxides easily smelted. The uncovered portion of the vein is more than sixty feet, averaging 16 per cent copper. The owners state that the present plant is but a forerunner, as they confidently expect to quadruple their present capacity within the year.

TROJAN.—It is stated that this company will erect a 100-stamp mill on Spearfish this spring, work to begin at the earliest possible moment. The works will be about four miles from the mines, but connection will be made by means of a narrow-gauge railroad.

IDAHO.

According to the Wood River *Times*, the value of the ore ready for shipment and on the dumps at the mines is stated to be as follows: On the Eureka, $65,000; Bullion, $55,000; Mayflower, $62,000; Jay Gould, $25,000; O K, $48,000; Bates & Boyd, $30,000; Idahoan, $75,000; Mountain View and Rough & Ready, $20,000; Point Lookout, $15,000; Red Elephant, $8000. Total, $403,000. Large reserves are in sight in all the mines.

EUREKA.—A strike has been made in this mine, situated about nine miles from Hailey. The find so far consists of hundreds of tons of float which assays high in silver and is milling and roasting ore. Boulders are found, on the surface and partly covered, of all sizes and up to ten tons in weight, but no ledge in place. The course of the float deposit is northwest and southeast, and it is traced for miles. An open cut will be run on the bed-rock, to endeavor to cross the vein.

MAYFLOWER.—The first load of this company's ore was shipped to Omaha on the 24th ultimo. Shipments will be made regularly after this.

MAINE.

Our correspondent, "Dirigo," writes us as follows, under date of April 10th:

Captain Moyle, of the Blue Hill, has been West on business this spring, and now, I understand, has gone to England. During his absence, Captain Ludlow, formerly superintendent of the Young Hecla, will have charge of the mine. The company is sinking on the incline. The smelter is not running at present.

The Stewart has got a 12-inch by 36-inch engine in place for hoisting, running pump, etc., and work underground will now be resumed. Shaft No. 3 is down about 160 feet, and the first level will at once be started.

The Douglass has been laying a tramway in the incline; therefore no sinking has been done for some time. The self-dumping skip is running and works finely. The refining-furnace will soon be completed. The concentrating-works have been running through the winter. After breaking and roasting, the ore is crushed by Cornish rolls, of which the mill has three sets. The soluble portion of the copper is then leached out. The ore is then passed over Bradford jigs. I hope to give a full description of the process soon. The long winter and great amount of ice, suspending navigation for so long a time, have made the coal run short; therefore the smelters are not running at present, but will start up soon. The company will probably take about 1500 tons of rock per month from the mine this season, running 2½ per cent of copper. The company has an extensive plant and good management, and I see no reason to doubt its ability to get along without levying further assessments.

MICHIGAN.

The Houghton *Mining Gazette* reports the shipments of the following mines for March as follows:

	Tons.	Lbs.
Calumet & Hecla	1853	1555
Quincy	225	520
Atlantic	164	825
Franklin	160	210
Allouez	90	540
Pewabic	70	500
Peninsula	59	1630
Grand Portage	40	458

RED RIDGE.—A dispatch from Escanaba says that a cave-in occurred at this mine, between Quinnesec and Iron Mountain, carrying down the engine-house and also eight men. These men were on the surface. No one was at work in the mine. The cave-in embraced a space of seventy-five by fifty feet, and besides the men engulfed, took in all the mining machinery, including four large boilers, which fell a distance of 100 or 200 feet. It is believed that all the men are dead, and it is estimated that the recovery of the bodies will require a week or more.

MONTANA.

BOZEMAN TUNNEL.—The tunnel penetrates the mountain 700 feet from the east side, and about 450 feet from the west, making altogether about 1150 of tunneling finished, out of the 3600 feet necessary to complete the work. The track of the Northern Pacific is now this side of Bozeman two or three miles, and coming along rapidly.

KIT CARSON.—The owners have been at work for the past two years developing the mine, and besides a large quantity of good ore which they are reserving for home reduction, they have taken out enough rich shipping ore to about pay the development expenses. The prospects are reported to be favorable.

SUMMIT DISTRICT.

ALICE.—The *Inter-Mountain* says that developments are progressing as usual. On the 100-foot south level, 20 tons of free ore are extracted daily. From the 200-foot station, a south cross-cut was run during the past week, which has intersected the vein mentioned above. East and west drifts have been started. The ore-body is about the same width as in the level above, but is a sulphuret instead of a free ore. On the 700-foot level, nothing new is to be reported. The sinking of the winze, which is now 60 feet deep, is slowly but steadily progressing on good ore all the way down. The Magna Charta is producing daily 60 tons of ore. The most important development of the past week is the striking of the pay-chute on the 500-foot level at a point 90 feet west of the cross-cut, where three feet of 40-ounce ore are exposed. All other workings are looking as usual. The sinking of the pump-compartment of the main shaft, which is now 150 feet deep, will soon be resumed.

LEXINGTON.—Above the 300-foot level, the mine is well opened and shows good ore-reserves. The 400-foot level is also explored, one chute four feet wide and assaying $100 a ton having already been opened for 120 feet. The other workings of this level are also looking well. The mill is running satisfactorily.

MOULTON.—The new surface strike on the south vein is developing with splendid success, the bottom of the shaft, which is now about thirty feet deep, being all in ore of exceptionally fine quality, bucket samples assaying from 75 to 100 ounces. In the stopes between the 200 and 100-foot levels, the ore-body retains its width and richness, and the miners are extracting about 30 tons of forty-ounce ore per day. On the 300-foot level, explorations actively continue, and on the south vein, which was struck in the south cross-cut from the main level on the middle vein, a fine quality of ore is extracted. The chute is proving richer as it is opened westward. Where it was first intersected, the ore was of low grade.

NEVADA.

BERRYMAN TUNNEL AND MINING COMPANY.

This company has been organized for the purpose of developing six mining claims, each 1500 feet long by 600 feet wide, upon Silverado Mountain in Pinto Mining District. Work on the property will be begun at once. None of these mines has been prospected to any great depth, but recent developments, particularly in the Diagonal mine, show that the ore-bodies continue as depth is attained. The intention of the company is to thoroughly prospect its ground, and by vigorous work this spring and summer determine its value. The surface ground is rich in fine float-rock, and is broken up and mineralized at almost every point.

GEDDES & BERTRAND.—This company employs at present 40 miners and 60 mill hands. Last month, about 58 tons of dry ore were worked per day in the mill. Developments continue to be made, and work at the different shafts and levels is pushed with vigor. The ore dips at an angle of 40 degrees from the main shaft, and is principally antimonial silver.

NAVAJO.—The official report for week ended March 29th shows total depth of shaft, 520 feet; rock continues very hard; no water yet encountered. Drift south, 450 level, extended 16 feet; no material change to note. South drift, east lateral vein, 350 level, advanced 19 feet. Stopes and other workings throughout the mine are without material change. The ore milled during the past week averaged $239.01 per ton.

UTAH.

The Salt Lake *Tribune* says:

EMPIRE.—The sale is postponed until the middle of April. Hopes are expressed that the company will be able to keep its mine, and that capital will be put up to work it, without further difficulty.

MAMMOTH.—Pay-day passed without the needful remittances from England, and the employés took matte and other property in their possession pending settlements, which will doubtless be made within a few days. The furnaces are not in operation, but are bedded down, and can be started up at any time.

ONTARIO.—All the operations at the mine go forward well, and with a definite purpose. The water has become somewhat heavier than for a while back; but whether this is caused by the melting snows from the surface or by percolations from the Empire can not be definitely stated, there being partisans to both theories.

FINANCIAL.

Gold and Silver Stocks.

New York, Friday Evening, April 13.

The mining market has been almost exclusively confined to dealings in Sonora and Robinson stocks, and the remainder of the market affords but little interest. It has been a fight to "squeeze out" the "short interest" in Sonora, and in consequence, the price of that stock has been manipulated up to far above its real value. After the third call to-day of the Mining Board, over three thousand shares of the stock were sold out "under the rule," showing that the "squeeze" had been successful in a small way. Robinson Consolidated has been manipulated in sympathy with Sonora. Amie, Elko Consolidated, and Decatur record large dealings, but were generally weak. Below will be found a complete summary of the market. The total number of mining shares sold at all the Exchanges aggregates 344,094, as against 421,415 last week.

The Comstock shares were very quiet at steady prices. California sold to the extent of 2285 shares at 20@22@21c. Consolidated Virginia was a little weak, under a small business, selling from 51@46c. Sierra Nevada records a small business at steady prices, selling at $2.25@$2.30. Union Consolidated had one small transaction at $3.75. Mexican had a moderate business and was irregular; it sold from $3.25@$2.88. Savage sold at $2.25, Yellow Jacket at $3.15, and Best & Belcher at $3.75. Sutro Tunnel was very quiet and steady, and sold at 20@21c.

The Leadville stocks were quiet and steady. Amie Consolidated records an active business, and was a little weak; it sold from 24@20c. Chrysolite was quiet and a little weak, selling from $1.20@$1.15. Dunkin records a small business at steady prices, selling at 23@25c. Hibernia sold at 3c. Iron Silver had a small business and was irregular; it sold from $2.80 @$2.95@$2.85. Leadville was quiet and steady, selling from 64@70c. Little Chief was moderately dealt in at irregular prices; it sold from 41@48@45c. Little Pittsburg was dealt in to the extent of 1400 shares at 60@65c. Big Pittsburg was quiet and steady at 17@15c. Climax sold at 6c.

The Bodie stocks were almost neglected. Bodie Consolidated was quiet and steady; assessment-paid shares sold at $1.40@$1.45, and assessment-unpaid shares at 95@85c. Standard has gained a little strength, under a small business; it sold from $6.50@ $7, with a business of 1305 shares.

The Tuscarora stocks were quiet and steady. Argenta sold at 85c., under a transaction of 100 shares. Navajo was moderately dealt in, and gained a little strength; it sold from $3.25@$3.40. Independence was quiet and steady at 65c. North Belle Isle records transactions to-day of 700 shares at 35@30c. Elko Consolidated has been very active and has been weak. This is owing to the assessment recently levied. It sold from 9@5c., the transactions aggregating 36,400 shares.

In the miscellaneous list, Alice has been quiet and strong, selling from $2.75@$3. Bassick sold at $9.75. Eureka Consolidated was irregular under a small business, selling from $6@$5.50@$5.75, assessment paid, and at $4.50, assessment unpaid. The Green Mountain stocks were quiet and a little weak. Gold Stripe sold at 5c. Green Mountain sold from 83@ 80c. Rising Sun sold at 3c., and Cherokee at 2c. Hall-Anderson records a fair business at very irregular prices; it sold from $1.50@$1.85@$1.55@ $1.85, the business amounting to 6100 shares. Homestake declined from $15.50@$15, with a small business. Horn-Silver was quiet and strong, selling from $7.75@$8. Northern Belle rallied from its recent weakness, and was strong at $9@$9.50 under a small business. Robinson Consolidated records a very active business at irregular prices; it rallied to-day, however, and was strong, closing firm; it sold from 69@88@84c., the transactions amounting to 94,800 shares. Sierra Grande was rather quiet at irregular prices, closing weak to-day; it sold from $1.75@$1.95@$1.75. Silver King continues to grow weaker, and this week declined from $10.50@$10 under a small business. Spring Valley, under small transactions, was strong, selling from $1.50@$1.85@$1.75.

Alta-Montana has been quiet and steady, selling at 8c. Bradshaw records a small business at steady prices, selling from 30@28c. Bull-Domingo sold at 7c., with a very small business. Central Arizona was dealt in to the extent of 300 shares at 30c. Decatur was active and irregular, selling from 4@6@ 5c. Eastern Oregon sold from 50@60c. Harlem M. & M. Co. was moderately dealt in at strong prices; it sold from $1.50@$1.45. Lacrosse sold from 14@11@13c., with transactions of 10,500 shares. Oriental & Miller was very quiet and was steady; it sold from 18@16c. Silver Cliff records but a small business, and was steady at 35c. Sonora Consolidated has been active and very strong; it sold from 37@$1.45, closing to-day at $1.25, the business amounting to 69,400 shares. South Pacific was quiet and steady at 6@5c. The State Line stocks were quiet and steady; Nos. 1 and 4 sold at 2c., and Nos. 2 and 3 at 5@6c. Taylor-Plumas declined from 17@13@14c., under a small business.

MEETINGS.

The Centennial Copper Company, No. 1 Pearl street, New York City. Annual meeting of stockholders and election of directors, April 23d, at twelve o'clock M.

The Hite Gold Quartz Company, Room 88, No. 35 Broadway, New York City. Annual meeting of stockholders and election of trustees, April 19th, from twelve to one o'clock P.M.

DIVIDENDS.

The Homestake Mining Company, of Dakota, has declared a dividend (No. 56) of $50,000, payable April 25th. Transfer-books close on the 20th. Total amount of dividends paid to date $1,962,500.

The Northern Belle Mining Company, of Nevada, has declared a dividend of 50 cents per share.

The Oxford Gold Mining Company, of Nova Scotia, has declared a dividend (No. 2) of five per cent on the capital stock, payable April 20th. Transfer-books close April 14th, and reopen April 21st.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, Petroleum and Mining Brokers, No. 55 Broadway, report as follows for the week ended April 18th, at noon:

At the date of our last report, oil was selling about 91⅛c., and the decline which had been in progress for a week was not arrested until Monday, the 9th, when prices touched 88c. From that point, a recovery began, and on April 11th, the market, which opened at 89⅝c., closed at 96¼c. On Thursday, the 12th, the market opened at 98⅛c., and during the day sold down to 95⅝c., closing at 96⅛c. This morning, it opened at 95¾c., sold down to 93¼c., and closed at 93⅜c. bid for the noon session.

The influences that operated to depress the market from $1.10, the price which prevailed three weeks ago, were, first, a desire by long holders to realize, and the creation of a considerable short interest in view of the new wells which were expected in the Balltown District. These wells, the Welch, the Murphy, and Grand in No. 6, were held over the trade as a *bête noire*, and the idea was, that if these wells became producers, it would extend the area of productive territory. As a matter of fact, they did start off with a pretty good production, but this soon fell off. The decline in the production of these wells, and the increasing shipments to the seaboard from the oil region, started a buying movement that may advance oil to higher figures during the month, with occasional reactions meantime. It is understood that the Standard Oil Company, which heretofore has made contracts for refined oil for the summer months, declines to make such contracts at the present rate for refined later than May 1st. The German and foreign buyers are holding off for lower figures; but the presumption is, that the Standard will be interested in marking up the price of crude oil, in order to make a demand for refined, which can be more advantageously disposed of when the crude market is strong and advancing.

On Tuesday last, the members of the National Petroleum Exchange voted to adopt the amendments to the constitution necessary to effect a consolidation with the New York Mining Stock Exchange. The vote stood 335 for and only six votes against them. A vote was taken on Thursday for the fifteen members of the governing committee of the consolidated Exchange to which the Petroleum Exchange is entitled, and the following ticket was elected: Three years—Charles G. Wilson, Henry H. Truman, J. S. Stanton, Emil Schalk, and James F. Hughes; two years—Randal H. Foote, C. F. Schramme, Howard Bird, W. J. Osborn, and S. S. Sonneborn; and one year—F. H. O'Connor, James E. Little, E. H. Bunker, H. A. Heiser, and C. G. Fales.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
April 7....	$0.91	$0.92⅜	$0.91	$0.91¼	340,000
9....	.92¼	.92½	.88⅞	.89⅝	633,000
10.....	.89	.91¼	.89	.90	794,000
11.....	.90	.96½	.89¾	.96	959,000
12.. ..	.97⅝	.97⅞	.95⅝	.96¼	623,000
13.....	.95¼	.96⅞	.93⅝	.94½	683,000
Total sales.					4,032,000

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been dull. The principal business done was in the shares of the middle Comstocks, and they were quite active at advanced prices. The remainder of the Comstock market was quiet and weak. Outside stocks were but moderately dealt in and were steady. The Yellow Jacket Company has rescinded the dividend recently declared, owing, it is said, to legal difficulties. The following assessments have been levied during the week: Alta-Montana, twenty-five cents per share; Elko Consolidated, fifteen cents per share; and Scorpion, ten cents per share.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, April 12.

The market for copper stocks continues dull, with prices still tending downward, and the outlook is far from encouraging. The dealings are confined to a few specialties, and there seems to be a greater desire to sell on the part of holders, who see in the future a reduction of dividends, and a possibility of some of the mines being obliged to pass dividends altogether. Ingot copper continues weak, and one party said yesterday that it could not be bought below 16 cents, and was hard to sell at that price. This tendency, of course, checks all speculation in copper stocks for the present; but those who hold on to their stocks will doubtless see a turn in the market within the next six months, and be enabled to sell at better prices. Calumet & Hecla declined to $239½, against $241 last week, and closed offered at $240. Franklin declined from $11¼ to $10½, with later sales at $11, which was bid. Some exceptions have been taken to our remark of last week, "that the decline in ingot copper would doubtless prevent the payment of a dividend the coming year." We are told by a party who ought to know that a dividend will no doubt be forthcoming, notwithstanding the lower price for ingot. Time will show which is correct. Pewabic is almost entirely out of the market. The call for another dollar assessment on this stock does not hold out much inducement to buyers, and those who are holders are obliged to keep their stock and pay the assessment, or let it go by default. The only sale the past week was 10 shares at $4. Quincy is weak, and shows a decline from $49¼@$46½, and closed at $46½ bid. A considera-

Digitized by Google

ble amount of this stock has changed hands the past week, every effort to sell being followed by lower prices. Osceola has been fairly active and quite firm at $27@$26½, being offered at the latter price to-day, and no bid. Huron, which declined last week to 50c. per share, has shown a fair degree of activity, and advanced to 87½c; but the announcement of another assessment of $1 per share caused it to weaken and decline to 62½c. National declined from $1⅛@75c., probably in sympathy with its neighbor, the Huron, and a fear that they may be treated to a similar "Irish dividend." Allouez declined from $2¼@$2.

In silver stocks, about the only feature is the activity in Catalpa, which has advanced from 47½@70c. on sales of 16,000 shares. The advance is said to be due to the improved outlook of the mine. Bonanza declined from $2¼@$2½. Silver Islet sold at $3, same as before. Crescent, 22½c. San Pedro, 57⅛@60c.

At the Boston Mining and Stock Exchange, business continues to rule dull and featureless. The public manifests no anxiety to operate in mining stocks as a rule, and most of the transactions recorded are made by room traders. In Catalpa, Crescent, and other stocks dealt in by the old Board, there is more or less doing every day as between the Boards; but in the specialties of the Mining Exchange, the trading is very limited. Massachusetts & New Mexico, which formerly was an active stock and generally looked upon as a first-class mine, seems to have literally melted away; the stock selling at 7@8c., with an assessment of 5 cents per share paid. Empire, also an old-time favorite, has settled down to 16@17c., and is barely held at these figures by its friends. Bowman Silver, recently listed and put upon the market at 16@17c., has been hammered down to 9@10c. Brunswick Ship's Berth Company is dealt in quite extensively, and offers by its fluctuation, a good margin for "turns."

3 P.M.—At the afternoon Board, Catalpa advanced to 75c., but later sold at 72½c. Crescent sold at 25c. Huron declined to 50c. again. Quincy declined to $46. San Pedro, 57½@60c. Closing prices:

Allouez, $2½ asked. Atlantic, $11@$12 asked. Bonanza, $2@$2½ asked. Antimony, $14@$15 asked. Calumet & Hecla, $240 asked. Catalpa, 75c. asked. Crescent, 25c. asked. Franklin, $10½@$11. Harshaw, $¾. Huron, 50c. bid. Osceola, $26½. Pewabic, $5. Quincy, $46 bid. San Pedro, 55c. bid. Silver Islet, $2½ bid, $3 asked. Sullivan, $⅛@$⅜.

METALS.

NEW YORK, Friday Evening, April 13.

Copper.—Buyers apparently have not got over the shock of the recent decline in Lake, and hesitate, it would seem, because they expect a further decline. We hear that there have been sales of Lake equivalent to 15⅞c. here, at Waterbury, but little has been done here. English advices state that the quantity of Lake copper placed there is 7000 tons. In other branches, little is doing at the range of 14⅛@15½c., according to quality. As indicating the export movement of "furnace material," we may state that to date there have been shipped for this month alone 12,309 sacks, or fully 600 tons.

Messrs. Richardson & Co., of Swansea, quote, under date of March 31st, ores and regulus 12s. 9d.@13s.3d. per unit, while Messrs. French & Smith, of London and Liverpool, quote ore 12@13s. net.

The private sales at Swansea, during the month of March, consist of 315 tons of New Quebrada yellow ore at 12s. 6d.; Cueva de la Mora precipitate, 330 tons, for delivery in Liverpool, at 13s., 1163 tons at 12s. 9d.; and 32 tons of Aljustrel a t12s. 7½d. per unit.

We note that Wyoming copper, reported to be very good-looking metal, has for the first time made its appearance in this market.

England, by cable, is unchanged, quotations being £64@£64 5s. for Chili Bars, and £70@£70 10s. for Best Selected.

Lead.—The movement to depress the market having ceased, this metal has nominally reacted, though there is no business to report. We quote Common lead nominally 4·50@4·57c.

From St. Louis, Messrs. John Wahl & Co. wire us as follows to-day:

Our market is firm. Sales on Monday were 140 tons of Refined at 4·20c., and 200 tons at 4·23c. for April delivery; on Tuesday, 80 tons of Hard lead at 4·12½c.; on Wednesday, 300 tons Refined for May delivery at 4·23c.; and to-day, 180 tons Chemical lead at 4·12½c.

Tin.—The market has been dull and business of a limited character, with a tendency to lower figures based upon Singapore and London. We quote Straits spot 21c. cash. London cables £94.

Spelter.—We have no transactions of any magnitude to report. We quote: Common Domestic, 4·70@4·85c.; and Silesian, of which there is very little here, 5⅛@5¼c. London cables £15 5s.@£15 10s.

Antimony.—The market has been very quiet. We quote 9⅞@10c. for Hallett's, and 10⅞@11c. for Cookson's.

BULLION MARKET.

NEW YORK, Friday Evening, April 13.

The absence of strength, noted in our report of the silver market last week, has become more marked, and the indications are, that lower figures will be made the coming week.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, April 13.

Mr. Edward J. Shriver, Secretary of the New York Iron and Metal Exchange, has compiled the following statement of the stocks in bonds in New York, Philadelphia, Baltimore, and New Orleans:

	Jan. 1.	March 1.	April 1.
Pig-iron	6,330 tons.	8,872 tons.	9,268 tons.
Spiegel-iron	4,131 "	3,674 "	3,388 "
Old rails	5,504 "	6,019 "	5,186 "
Scrap-iron	1,384 "	2,809 "	3,062 "
Scrap-steel	456 "	456 "	306 "
New iron rail	6,642 "	6,821 "	6,225 "
New steel rails	4,816 "	5,213 "	4,698 "
Grand total	29,263 tons.	33,864 tons.	32,133 tons.
Decrease during March, 1883			1,731 tons.

American Pig.—The dullness of the past months has developed into complete stagnation, and we do not hear of a single transaction of any thing above a jobbing character, and furnace-men are apparently not even accorded the poor consolation of an occasional inquiry. The makers of standard brands appear to hold firmly to their prices; but unless a reaction sets in, some of them will be forced to move some of the accumulating stocks at lower figures. Outside brands are offered at greater concessions. We quote for American Foundry, No. 1, at tidewater, $22.50@$24, nominally, for ordinary to choice; $21@$22 for No. 2; $18.50@$19.50 for Gray Forge; and $16@$17 for White and Mottled. In Bessemer pig, we hear of no transactions, $22 being asked for American. Spiegeleisen is unchanged at former quotations, $32 for 20 per cent, and $26 for 12 to 15 per cent.

Scotch Pig.—Practically nothing has been done The arrivals are light—600 tons—but only part of them have gone into consumers' hands, which is a discouraging symptom. Freights from Glasgow are 5 shillings. We quote nominally, Coltness and Langloan, $24@$24.50; Glengarnock, $22@$22.50; and Eglinton, $21@$21.50. At the Wall Street Exchange, the following cables were received to-day: Carnbroe, 55s. 3d.; Gartsherrie and Summerlee, 61s. 3d; Coltness, 63s.; Langloan, 64s.; Glengarnock, 54s. 9d.; and Eglinton 48s. 6d. Warrants are 47s. 1d., a little higher.

Rails.—During the week, sales aggregating about 30,000 tons have been made in one large lot and several small lots, at prices varying from $38@$39 at mill, which we quote, 20,000 tons having been taken by one Pennsylvania mill at the lowest figures stated. England is lower. The statistics of track laid during the first three months of the current year, as compiled by the *Railway Age*, are not encouraging to this interest, though the severe winter told against active work in some of the sections where the additions to the mileage are heaviest. The total for the first three months of 1882 is only 766 miles, against 1200 miles during the corresponding period of 1881.

Old Rails.—Business is restricted, spot lots of Ts ranging from $24@24.50, while for future delivery the quotations are lower. Double Heads are scarce.

Scraps.—We have no business of magnitude to report, the market being dull and lifeless at $25 for No. 1 asked, ex ship.

Philadelphia. April 13

The fact is becoming more widely recognized that the producing capacity is so much larger than the consuming capacity that a further decline in iron and steel is only a question of time, and that restriction in some form or other, voluntary or through strikes, will become a necessity. Iron-making capacity has been restricted from 10 to 15 per cent, according to some estimates, and a further restriction is thought probable unless some relief is obtained through an increasing demand.

Pig-Iron.—The market is not weaker than usual; in fact, the transactions during the past week indicate that the consumers of forge iron especially have a good deal of confidence in the future of trade, because they have been purchasing with a good deal of freedom, and for deliveries from sixty to ninety days distant in a few cases. Inferior irons are sold at a sacrifice in some cases, and only the very best of the standard irons command any thing like full prices. Two or three are held near $21, but the most irons are selling in the neighborhood of $19, and some from 50 cents to $1 less. Concessions are readily extended, and buyers have been covering future requirements for from thirty to sixty days. Foundry irons are selling almost altogether in small lots, those of 100 tons being exceptional transactions. To-day's quotations run from $23.50@$24.50 for No. 1, and $21.50@$22.50 for No. 2. There is less inquiry, and buyers are not disposed as a rule to go beyond their immediate requirements.

Foreign Irons.—English is to be had between $20 and $21, and retail lots of Scotch have been going all

the week at prices from $20@$25. The founders can not be induced to take hold in large lots, as they expect to buy domestic irons at more favorable rates. Bessemer iron can be sold at $21@$21.50. The selling prices are one dollar above this. Buyers are holding off.

Charcoal Blooms are firm at $64@$65 for the best makes, and $60@62 for some inferior products. Anthracite Blooms have sold between the limits of $53@$57, according to quality and size of order.

The Merchant Iron market is still sluggish. The store-keepers report a fair amount of business transacted, and 2·30c seems to be the best price obtained for small lots, but 2·25c. is not exceptional. Mill-owners generally agree that the demand is not active, and that it is a difficult matter to maintain prices at remunerative limits. Refined Bar has been booked at 2·20c. and from that down to 2c. for large lots. Consumers are purchasing for immediate requirements, and consider that the outlook is favorable to still lower prices, although manufacturers say that present rates are the lowest possible. Nothing but a further decline in pig-iron will weaken Merchant Bar below 2@2·20c., and furnace-men would rather blow out than quote lower than the figures given. A number of furnaces are now idle. Skelp Iron is under fair inquiry for summer and fall delivery between 2·10@2·40c.

Sheet-Iron is active in small lots at 3¾@4½c. for light and heavy sheets, according to gauge, and large shipments of galvanized iron have just been made on old orders at 35 per cent off. Prices are weak, and for large orders there is an active competition among makers. Considerable improvement is noted in Common and Refined plate for building purposes; but prices are lower than usual. Common Plate is quoted at 2·40c.; Shell-Iron at 3¼@3·40c.; and Flange Iron, all the way from 4@4·40c.; Fire-Box, 5@5¼c. There is an active competition for business in Plate-Iron.

Structural Iron.—Bridge Iron has been inquired for in large lots, and orders have been booked at low figures. Quotations are given at 2½c. for Angles; 3@3¼c. for Tees; and 3¼@3½c. for Channels and Beams. The manufacturers have a large amount of business in sight; but the active competition for it is likely to depress selling prices a little lower than quoted now.

As to labor troubles, it is too soon to say very much. The Amalgamated Association has not yet named its committee to confer with the manufacturers' committee; but from the tone of expressions made at the meetings of the respective parties, it is thought that an amicable adjustment will be effected, though it must be on the basis of a further decline in wages.

Steel is moving in larger lots this week, because consumers have been holding off for a good many weeks for lower prices. The concessions have been made, and requirements for a month or two are filling.

Steel Rails are in active demand at $39, with concessions for larger lots, and the volume of business placed is sufficient to prevent any further competition.

Old Rails.—Movements in old rails are exceedingly dull, and a few lots have been sold at $25 for Tees. Offers are made by sellers at $28 for Double-Heads, but no buyers have come around. Negotiations are in hand for summer shipment at a dollar per ton off.

Scrap-Iron has sold in large lots at $25 for No. 2, and $26@$27 for No. 1, and business is done in cargo lots for shipment at $25.

The general tone of the market is less encouraging than some time ago; but the consumption is still large, and the only obstacle in the way of a heavy demand is as to bottom prices. With more iron making than there is an apparent demand for, the tendency is toweakness; and buyers, instead of anticipating requirements as they do on a rising market, wait for sellers to move, and hence give prices a downward tendency.

Cleveland. April 12.

We note for the past week a fair trade in pig-iron and as a rule at firm prices. Consumers are not yet agreed that the uncertainty as to the course of the market is over, and in consequence are not willing to buy far ahead. On the other side, furnaces do not wish to make contracts for future delivery at ruling figures, as they see little or no profit at present cost of manufacture. The developments of the next two or three weeks as to the labor scale on finished iron will determine the course of many managers about purchases of ore, etc. Until that cause of distrust is removed, it is not probable that any great activity either in ores or pig-iron will be seen.

We quote as before.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, April 13.

Anthracite.

The market is considerably duller than it has been, and while the companies, so far as known, are firmly adhering to their prices in this market, there is considerable pressure to sell on the part of individual operators, and middlemen, in their anxiety to retain trade, are cuting down their commissions, occasionally entirely giving them up to buyers, who are thus encouraged in their policy of holding off.

All the companies are stocking coal more or less, but not by any means to an extent that would make them anxious to reduce their stocks. The Eastern market is still in an unsatisfactory condition, while the Western trade will not begin for some time to come. The coal movement from Buffalo by lake is not likely to be open for several weeks, while last year lake navigation opened on the 26th of March. The stock of anthracite ready for shipment on the docks does not exceed 150,000 tons.

Bituminous.

According to all indications, matters in the bituminous coal trade are rapidly approaching a crisis, and the happenings of the next week or two will probably decide whether or not the hopes of consumers that concessions will be possible are well founded. The hesitation shown in delaying the award of a number of some of the largest contracts for which bids were opened during the past two weeks is attributed to efforts made by the parties using the coal to engineer a break in the railroad rates. The statements which are brought forward to convince each one of the two vast roads which has entered into the agreement, that the other has not adhered to its provisions, are calcuted to put a severe strain upon the compact. On the one hand, Cumberland coal appears to have been sold at low figures in the Eastern market, a fact which, it is urged, can not be entirely explained away by pointing to the lower rates at which this coal can be put down at Georgetown via canal. On the other hand, large contracts have been made by Clearfield operators, one of 15,000 tons within the last ten days, at a figure alongside in this harbor, which would leave a direct loss of 20 cents per ton, estimating the cost of delivering the coal into cars at the mine at 75 cents.

These are some of the considerations that enter into this knotty problem. Its solution, whether by violent or other means, is, we believe, near at hand. Should it lead to a break, the bituminous operators will be afforded an opportunity to largely widen their market, particularly in the East.

During the week, a number of smaller contracts have been closed. Current business, however, is slack and prices are low. We quote nominally, $4.35@$4.50for Clearfield, and $4.40@$4.60 for Cumberland, according to quality.

The Horsford Almanac and Cook Book

mailed free on application to the Rumford Chemical Works, Providence, R. I.

PATENTS.

SECURED and SOLD in all countries. Partners procured, Joint Stock Companies organized. 52 page "Inventor's Handbook" free, giving patent laws of all countries and full information how to procure, sell, develope or secure capital on patents. E. L. RICHARDS & CO. 814 B'way, N.Y.

IRON MARKET REVIEW ... 230

COAL TRADE REVIEW ... 232

Advertisers' Index ... x

AN important piece of news, as affecting the future of the Tombstone District, comes to us from a reliable source, a body of low-grade ore, 22 feet wide, having been found on the 600-foot level of the Contention mine. We are informed that it follows a stratum of limestone, and is regarded as assuring the continuation of the ore in depth.

AMONG the papers read at the Washington meeting of the National Academy of Sciences was one by Professor LE CONTE on the genesis of metalliferous veins ; one by Prof. GEORGE F. BARKER, on the efficiency of storage batteries ; one by Dr. T. STERRY HUNT, on the decay of rocks, geologically considered ; and one by Mr. W. FERRELL on a tide-predicting machine, which is very highly spoken of.

HAVE the engineers who propose to build the great Quaker Bridge dam 230 feet high from bed-rock considered the relative cost and safety of masonry and concrete or *béton* ? Experiments that we made some years ago upon the impermeability of *béton* to water under pressures up to 150 pounds per square inch were highly satisfactory, and convinced us that monolithic dams of *béton* could be made both safer and cheaper than those of masonry.

THE investigating committee of the San Francisco Stock Exchange, from which we quote elsewhere, takes a comparatively cheerful view of matters on the Comstock lode, while deploring the secrecy with which the results of exploration-work, notably that conducted with the diamond drill, are guarded. So long as the too well-known present *régime* holds sway, the general public, cautioned by painful experience, will keep aloof.

IN our issue of the 24th of March, we printed a letter by a correspondent in Boulder County, Colo., on the telluride ores of that section, which, while reliable as to the character of the deposits, contained erroneous statements as to the losses in assaying of this class of ores, and the returns made by smelters to the miners. We are convinced from the statements submitted to us that the grievance of our correspondent and of those who may share his opinions are imaginary, and have little if any foundation in fact.

WE published last week a sharp letter from Mr. SHRIVER, of the Pearl Street Metal Exchange, replying to the recent criticisms of the *Iron Age* upon the proposed union of the two exchanges. The views expressed by the *Iron Age*, and also, a year ago, by this journal, are based on the impression that a speculative exchange in iron and metals, like those which exist in stocks and produce, is not needed or wished by the trade. Last year, we opposed this sort of a metal exchange, and favored as an experiment the more conservative and social one inaugurated in Wall street. It was a foregone conclusion that two could not thrive, so long as the question was still in doubt whether any was needed. The *Iron Age* now restates the old argument, reinforcing it with conclusions drawn from the experience of the past year. We, on the other hand, do not care to discourage further an honest experiment, which may, if it be prosecuted without dissensions and with discretion, have a better chance of success than the divided and semi-hostile enterprises of last year. If it succeeds and benefits the metal trades, we shall be glad of it—and we have no doubt the same can be said for every other organ of any of the trades concerned.

THE NEW YORK WATER SUPPLY.

Our esteemed and usually well-informed contemporary, the *Sanitary Engineer*, in referring to our remarks on the above subject, in the ENGINEERING AND MINING JOURNAL for March 17th, makes some statements which betray a lack of practical knowledge of the subject as well as a lack of candor in its criticism. The ENGINEERING AND MINING JOURNAL has no pet scheme to advocate, and no job in iron or any thing else, as our contemporary insinuates. We expressed surprise that the Aqueduct Commission had not, in the report we had seen, referred to such other methods of carrying water as siphon-pipes, and to other sources of supply than the Croton water-shed. We have since been favored with copies of the engineers' reports, in which we note that it is proposed to use siphons to cross Harlem River and other depressions.

We fully concur with Mr. NEWTON, the Engineer of the Croton Board, that a tunnel, where practicable, is better and safer than an elevated aqueduct, and where the water has to be carried with so slight a fall as is proposed (less than one foot per mile), a large section tunnel aqueduct is necessary ; but we are surprised that other sources of supply, offering advantages in economy, which have been proposed, are not even mentioned by the Aqueduct Commission.

We have no personal knowledge of the correctness of the figures given by either Mr. NEWTON and others concerning the Croton water-shed or of those given by Mr. WILLIAM J. MCALPINE, General VIELE, and others concerning the Ramapo water-shed ; but these gentlemen assert that a supply of some 200 or 250 million gallons a day of most excellent water can be secured in that district at an available elevation of about 480 feet above tide, or say 300 feet above the Central Park Reservoir, into which the new aqueduct is to discharge. The *Sanitary Engineer* ignores the effect of head in securing a larger discharge through comparatively small and inexpensive pipes ; and assuming a length and head to suit and a maximum diameter of three feet, it declares that it would require thirty-two such pipes to discharge the same amount as the 12-foot aqueduct under the conditions proposed by Mr. NEWTON. On this fictitious basis, it raises a nightmare of 200,000 tons of iron and an enormous cost. This method of making estimates is ingenious, but can scarcely aspire to the title of engineering, or even "popular science." Without having verified his figures, we quote Mr. MCALPINE, the engineer who reported on the Ramapo plan, who states that, with an aggregate fall of 132 feet in 31 miles, a pipe, varying in size from 7 feet to 5 feet 3 inches, according to the inclination, will deliver from 65 to 70 million gallons a day ; and he proposes using several such pipes.

We do not know where the *Sanitary Engineer* has found that three feet is the possible limit in size of wrought-iron or steel pipes ; but even if our contemporary has never heard of a larger size being made, why should it

Digitized by Google

consider this impossible when it accepts so readily as safe the much more difficult engineering work, a masonry dam 230 feet high from bed-rock, a hight much greater than has yet been built, or than a number of well-known examples, such as the Habra (Algiers), 112 feet; De Tibi (Spain), 146 feet; Puentes (Spain), 152 feet; Del Gasco (Spain), 188 feet, which gave way with a much less pressure than that proposed at Quaker Bridge?

The ENGINEERING AND MINING JOURNAL'S "neat aphorism," that no common masonry can be counted on to prevent filtration under a pressure of 100 pounds per square inch, and no dam that leaks can be considered perfectly safe, is *practical science*, not "popular science," and is "good engineering." Our contemporary's preference for a dam that leaks is certainly not shared by engineers who have had any practical experience in these matters; but when it is stated that "it is not true that a dam which leaks is unsafe, *provided* that the water passing through does not carry with it the material composing the dam," the *proviso* will probably be found to cover every case of common masonry under a pressure of 100 pounds to the square inch.

Our suggestion of using siphon-pipes was connected with the advantages of utilizing a high head; and assuming the statements made by the engineers who have examined it, that the Ramapo shed affords a sufficient supply, and that the distances are correct, we maintain that the cost of bringing the water through iron or steel pipes would be *far less expensive*, and no more subject to serious accident than the aqueduct plan.

We have no interest in any "private enterprise," and we believe the city should own its own water-works, and that they should have an abundant capacity; but we do not think it is to the interest of the city to rush through an enterprise which, unless all past experience is reversed, will become a gigantic job, without even considering other and far less costly and more quickly executed plans, which have been proposed upon respectable engineering evidence, and which involve far less risk than is involved in the building of a masonry dam 23 feet high—though we do not consider that impossible.

SEWAGE AND SEWERAGE.

The report of Mr. JAMES T. GARDINER to the N. Y. State Board of Health on the methods of sewerage for cities and large villages is a most valuable and interesting document. Mr. GARDINER begins with an unqualified condemnation of the system of privy-vaults and cess-pools; pronounces "dry removal" by means of earth-closets or pails to be much better, but open to serious objections, as requiring constant vigilance and intelligence on the part of householders; declares the ordinary method of combined sewerage, in which both the sewage proper and the much larger volume of storm-water are conveyed together in subterranean sewers to be, from the sanitary stand-point, a failure; and finally praises, as the best plan yet devised, the separate sewerage, by which *excreta*, slops, and waste-water are removed through mains, while storm-water is either provided with separate conduits of large dimensions, or led off on the surface to natural channels of outflow. The most perfect example of this system is found in the sewerage of the city of Memphis, designed by Col. GEORGE E. WARING, the eminent sanitary engineer, and operated since 1880 with complete success. Mr. GARDINER quotes at length from a report of Mr. C. H. LATROBE, who examined the Memphis system for the city of Baltimore.

The most striking points of Mr. GARDINER'S paper are these:

1. There is probably no such thing as a poisonous "sewer-gas," to which the diseases caused by the admission of sewer-air into dwellings may be ascribed. No proof exists that ammonia, sulphureted hydrogen, or any other gaseous products of organic decomposition, do or can cause zymotic diseases. On the contrary, there is much evidence going to show that these diseases are produced according to the so-called "germ-theory," by *bacteria*, the germs of which are developed in the sewer-air under the favoring conditions of heat, moisture, darkness, and the presence of ammonia, and growing thus on the damp walls of sewers, may float off and be borne like dust on the atmospheric currents.

The reader's first impression may be, that this is a distinction of little practical importance. What difference does it make to the victim of bad plumbing, to be told that he is poisoned, not by the gas from the sewer, but by germs in the gas from the sewer? The practical difference to the moribund victim may indeed be nothing; but it is highly important to prudent people not yet about to die, and to sanitary engineers. For it follows, first, that the odor of sewer-gas, though a useful warning of its presence, is not a measure of its poisonous character. A slight odor, given by air from a large and ventilated sewer, may accompany the maximum proportion of *bacteria*. Again, since damp exposed sewer-walls favor the multiplication of these low organisms, it is evident that large brick sewers, which run full in a heavy rain, and half full or nearly empty at other times, are the worst that can be used for this purpose, and not the best, as many engineers have supposed, and as indeed would be the case, if the dilution of the sewer-gas with air were an efficient means of rendering it harmless.

2. The large sewers have been adopted for this reason partly, and partly because they were required to convey sudden accumulations of storm-water, and it was thought a good thing to combine the two things, and secure a periodical natural flushing of the sewers. But it now appears that the best possible conduit for *excreta*, grease, and waste-water would be one exposing a minimum interior surface, and also permitting, by its small size, the use of enamel on that surface. This smooth material is easily kept clean, and the conditions for the growth of *bacteria* along the walls are greatly diminished or destroyed.

3. But such small sewer-mains would be totally inadequate to carry the storm-water, which is, during violent rains, nearly fifty times the ordinary sewage. Hence the necessity of a separate disposal of the storm-water. For the great majority of towns, no sewers would be needed for this purpose. The clean storm-water could be left to flow away to natural channels, as it does in the open country. In such cases, the cost of the small sewer-system would be from one fifth to one third only of that involved in the combined system. The estimates for the latter type in Memphis, ranged from $800,000 to $2,225,000; the actual cost of the separate system was $137,000. For towns which require short storm-water sewers to lead the rain-fall to natural channels, the expense would still be generally less than that of the extended and comprehensive combined sewerage. Finally, there are, no doubt, a few large cities, where complete underground systems of storm-water drainage are required. In these cases, the expense of a completed double system will be about one quarter greater than that of the combined system; but the sanitary gain will be worth its cost.

This subject is one of great and growing importance to all cities, and particularly to those which are beginning to organize water-supply and drainage. They will find great economy in beginning right; and the light which modern sanitary science has thrown on the subject comes none too early for them.

The articles on the sanitary condition of New York, contributed by Colonel WARING, some months ago, to the *Century* magazine, should not be overlooked in this connection. Together with Mr. GARDINER'S paper, they contain more "solid sense" on the subject of sewerage than many bulky volumes.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes. We do not hold ourselves responsible for the opinions of our correspondents.]

Basic Brick.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Will you have the kindness to inform us whether basic brick, so frequently spoken of in your columns, can be had in this country, and where?

W. G.

SOUTH STRAFFORD, VT., April 16.

So far as we have been able to learn, no basic brick have as yet been manufactured in this country. We presume that in many cases, probably also in that of our correspondent, it would be best to use the mixture of highly calcined dolomitic limestone and tar, which is now quite generally employed in European basic Bessemer works.—ED. E. AND M. J.

The Transmission of Sound through Rock.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Referring to a notice in the ENGINEERING AND MINING JOURNAL for March 17th, 1883, I beg leave to quote the official report on the geological survey of the St. Gothard Tunnel by Dr. F. M. Stapf. (*Geologische Tabellen und Durchschnitte über den Gothard Tunnel; Special-Beilage zu den Berichten des schweizerischen Bundesrathes über den Gang der Gotharduntern ehmung.* Bern, 1874–1882), where you will find the following on page 197 (North Side):

"On the 28th of February, 1880, at a quarter of seven A.M., the Airolo sounding-drill unexpectedly pierced the wall of from 2·6 to 2·8 meters thickness, which still separated the two headings. Carpenters in the northern adit believed that they heard the blasts from the southern adit, in the night of the 24th to 25th of December. At that time, the thickness of the intermediate rock was 415 meters (1361 feet). Another similar observation in the night of the 27th to 28th of December proved erroneous; but there was no doubt about the observation made on the Göschenen side, on the 29th of December, early in the morning, exactly at the time when the Airolo blasts were discharged. The thickness of the intermediate rock was 394 meters (1292 feet). Afterward, the blasts from the opposite headings were frequently heard; not as detonations, but as cracking in the rock and shaking shortly before they met. To the strength of the dynamite in use must be attributed the fact that the waves of sound are transmitted so far; and it is remarkable that they did so even through the fissured, rotten, decomposed but highly compressed rock near the center of the tunnel line. Forty meters (131 feet) in the rear of that ground, I heard, at 7439 meters (24,400 feet) from the northern entrance, on the 27th of January, the cracking from the Airolo blasts. At that time, the northern heading was in 7616 meters (24,980 feet), or 210 meters 689 feet) distant from the southern.

"A direct measurement of the velocity of transmission of sound through the rock was not possible without chronographs and a direct telegraph wire from one heading to the other. But it may be mentioned that

Digitized by Google

in hard solid rock, as, for instance, the granite gneiss of Göschenen, at a distance of some hundred meters from the blasts, the cracking (sound transmitted through the rock) is heard a moment before the detonation (sound transmitted through the air). In loose and not compressed rock, no cracking is perceived, and the detonation of the blasts sounds dull and hollow. On several occasions, I have tried to make out (by the help of a sound-watch) how much the cracking outruns the detonation; and as a fair mean, I have estimated the difference to be one third of a second per 200 meters (656 feet) distance. The velocity of sound through damp air of 30 degrees C. (86 degrees Fahr.) may be rated at 350 meters (1148 feet) per second, or 0·57 second per 200 meters (656 feet; consequently, the velocity of transmission of sound through 200 meters (656 feet) rock is 0·57 — 0·33 = 0·24 seconds, or 833 meters (2732 feet) per second.

"A feeble shock of the earth, which was felt on the 4th of July, 1880, through a great portion of Switzerland, at nine o'clock 21½ minutes A.M., in Airolo, and before the entrance of the tunnel, was not noticed at all in its interior."

F. M. STAPF.

WEISSENSEE, BERLIN, March 31, 1883.

Bessemerizing Copper Matte.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: May I again trespass briefly on your space, to clear up a matter which Mr. Paul Johnsson's letter in your issue of April 7th tends to obscure? He truly says that to oxidize a product in an open-hearth furnace through inclining tuyeres is not new; but neither is it Bessemerizing. Bessemerizing is oxidizing by a blast of air *so rapidly* as to generate a great quantity of available heat, materially lowering the fuel requirement, or increasing the temperature. This is but a few years old, and was, I believe, first described in print by Mr. Hollway as applied to rotating Bessemer converters, and first by myself as applied to reverberatories.

He considers an essential condition to be a gas-furnace using inclined removable water-tuyeres. A gas-furnace with inclined removable tuyeres was designed by Mr. W. E. C. Eustis and myself years ago, and was nearly completed. Water-tuyeres were considered by us; but we preferred, and still prefer, protecting the tuyeres otherwise. This combination, our prior invention, I do not consider essential, though probably generally desirable. It appears to me quite as strange as before, that, under the peculiar circumstances, Mr. Johnsson either did not know that our invention long antedated his, or that, knowing it, he described it as his own, without referring to our having antedated him.

The four points of construction claimed by Mr. Johnsson, which I stated in my letter of March 17th to have been already employed by the Orford Company, I still consider identical in principle with those employed by that company, with trivial difference in detail. It has used a reverberatory with a complete double roof, and years ago I smelted copper ores and matte in a reverberatory with doors opposite each other on the two sides of a furnace, which had in addition a door at the end as usual.

HENRY M. HOWE.

BOSTON, April 18, 1883.

OFFICIAL STATEMENTS AND REPORTS.

THE STANDARD CONSOLIDATED MINING COMPANY, BODIE, CAL.

The report of the Standard, the leading mine of Bodie, has just reached us, carrying the account of the affairs of the company to February 1st, 1883. The receipts for bullion were $1,175,728.01. The Bodie assays yielded $1,070,611.31 of gold, and $126,677.59 of silver; but the refining value was only $1,181,981.08, $1,072,482.49 of gold and $109,498.59 of silver—a difference of $15,327.82, to which must be added $6253.07 refinery charges, leaving the net amount as above, against $2,049,521.53 for the last fiscal year. On the credit side of the balance-sheet there are, besides $3494.25 unpaid dividends, $18,844.13 drafts, being the entire indebtedness of the company, $302,039.56 balance, profit and loss, and some minor items. The dividends paid during the year amounted to $675,000, against $975,000 during the preceding year. On the 1st of February, 1883, the dividend payments were on 130 shares only in San Francisco, while they were on 99,870 shares in New York.

According to the statement of the superintendent, Mr. William Irwin, the cost of mining 62,514 tons of ore was $282,539.17, or $4.51 per ton. In this, the cost of labor seems again only to include the cost of labor in stoping, $170,092 only; and $31,868 spent for wages in drifts, cross-cuts, and uprises is entirely left out of the calculation. This is unusual, and is misleading, the cost of dead-work being generally included in estimates of cost of mining. Among other items properly chargeable are $2444 for labor in connection with pumping, and $3206.36 in the new shaft. Fuel cost $24,058.75, including 2107 cords of wood at $11, and 3053 bushels of charcoal at 25 cents. The lumber and timber used was worth $22,806.53, while freight on supplies was $1480.22. Supplies were consumed apparently to the extent of $61,001.67, while, during the preceding year, there had been an apparent excess of $9126.06. Among the supplies purchased at Bodie for the mine we note $11,398.02 for powder, caps, and fuse, and $2010.40 for oil.

The Bulwer-Standard mill, one half of which is owned by the Standard Company, and for the use of the other half of which the company pays a very round sum, treated the bulk of the ore, 41,385 gross tons, or, allowing for 10 per cent moisture, 37,246 tons, at a reported average cost per ton of $3.40, according to Mr. Irwin's figuring. He takes only the amount of labor absolutely required for the crushing in the mill, dropping such an item as $2317.25 for improvements, repairs, etc., and not including $10,497.25 for transporting the ore—an item which the management of the Bulwer-Standard mill must, it seems, pay, and which makes the discrepancy less striking between the cost and the rate paid by the Standard mine to the mill, $11 in February last, $8 in the six months following, and $6 in the four months ended January 31st, 1882. The expenditure for fuel in the mill was $36,839 for 3349 cords of wood and $246.75 for 987 bushels of charcoal. Exactly what the quantities of different supplies required by the mill were can not be traced from the statements submitted. Among the heavier items of purchases at Bodie we note $2001.40 for 95,756 pounds of salt, at 1½, 2, and 2·3 cents per pound; 229,257 pounds of soda, at 1¼ cents per pound, or $4012.01; $2381.02 for oils; and $8964.58 for pan-shoes, dies, mullers, etc. At San Francisco, there were bought for the same mill 215 flasks of quicksilver, at a price ranging between 35½ and 37½ cents, a total of $6051.15; steel wire battery cloth, $1010.44; belting, $948.40; and pan-shoes and dies, from Pittsburg, Pa., $1588.70.

In a similar way, the cost of treating 20,929 gross tons of ore at the Standard mill is given as $96,636.31, or $4.61 per gross ton. The average assay of the ore worked in the Bulwer-Standard mill was $20.306 of gold and $3.284 of silver, the yield being $19.303 of gold and $2.297 of silver. The Standard mill ore ran $19.696 in gold and $3.204 in silver, and yielded $18.666 of gold and $2.184 of silver per ton on an average.

STATISTICS OF THE AMERICAN IRON TRADE IN 1882.

We are indebted to Mr. James M. Swank, Secretary of the American Iron and Steel Association, for advance-sheets of his annual report, which, we are pleased to note, he has been able to bring out nearly a month earlier this year, in spite of the arduous additional work which the tariff agitation of the past year must have heaped upon his shoulders.

Some of the data contained in the present report Mr. Swank has anticipated in bulletins, the main figures of which, relating to rails and pig-iron respectively, we printed in our issues of February 24th and March 24th. We quote from the report as follows:

Since the beginning of the present year, the condition of our iron and steel industries has not improved. January and February were dull months, a specially depressing influence being the uncertainty of tariff legislation at Washington. Consumption is now, however, more active since the adjournment of Congress and the opening of spring than during the winter months; but prices are very low, competition is sharp, and the market for most products is in favor of buyers rather than sellers. Some leading influences which unfavorably affected our iron and steel industries in 1882 still remain, particularly the interruption to new railroad projects and the tendency to overproduction in certain leading branches, to which must now be added the late reduction of duties, which goes into effect on the 1st of July. It seems to be absolutely certain that prices must for some time to come rule extremely low. This condition of affairs in the great industries under consideration may have its advantages in stimulating consumption at a time when the country is blessed with an abundance of good money, and in checking the erection of new rolling-mills, blast-furnaces, and steel-works which experience has shown are not needed; but it is greatly to be regretted that it brings also low wages, with no compensating benefits to those who receive them. It is not true, as a certain class of political economists persistently teach, that, when wages are reduced, other things are correspondingly reduced in price; but, even if this were so, low wages and low prices always suggest hard times. We do not, therefore, regard it as a propitious sign that prices of iron and steel are now so low as they are. Good prices and good wages were far better. But the fact can not be altered that low prices for iron and steel now prevail, and we can only hope that wages will be adjusted upon a scale that will be mutually satisfactory to manufacturers and their workmen.

Prices of Iron and Steel in 1882 *and* 1883.—The following table will show the range of prices for all leading iron and steel products in 1882 and in the first quarter of 1883. Monthly quotations are given, averaged from weekly quotations. The prices quoted are for a ton of 2240 pounds, except for bar iron and nails, which are quoted by the pound and the keg respectively. Where the asterisk occurs, there were no quotations to give, because no sales were reported:

MONTHS	Old T rails at Philadelphia.	New iron rails, at mills in Pennsylvania.	Steel rails, at mills in Pennsylvania.	Foreign Bessemer pig-iron, at Philadelphia.	No. 1 anthracite foundry pig-iron, at Philadelphia.	Gray forge pig-iron, at Philadelphia.	Common bar iron, at Pittsburg. Per pound.	Nails (gross price), at Pittsburg. Per keg.	Gray forge pig-iron, all lake ore, at Pittsburg.	Gray forge pig-iron, lake ore mixed, at Pittsburg.
January, 1882.....	$30.00	$48.50	$58.00	$27.50	$26.00	$24.00	2·5c.	$3.35	$28.00	$25.00
February.....	30.50	48.50	55.00	25.75	26.00	24.00	2·5c.	3.40	27.50	26.00

January, 1883 ...	26.50	*	40.00	22.25	25.00	21.00	2·2c.	3.40	23.00	21.00
February	26.00	*	39.50	22.25	24.50	20.50	2·c.	3.40	22.50	20.50
March.....	25.00	*	39.00	*	24.00	20.00	2·c.	3.40	21.00	20.00

This table shows a material decline in all prices, except for nails, which have not been produced in excess of the demand.

The Production of Iron and Steel in 1831 *and* 1882.—The production of iron and steel in the United States in 1882 is given in the following table, in comparison with that of 1881:

PRODUCTS.	Net tons. 1881.	1882.
Pig-iron.....	4,641,564	5,178,122
All rolled iron, including nails and excluding rails.....	2,155,346	2,265,957
Bessemer steel rails.....	1,330,302	1,438,155
Open-hearth steel rails.....	25,217	22,765
Iron rails.....	488,581	227,874
Kegs of cut nails and spikes, included in all rolled iron	5,794,206	6,147,097
Crucible steel ingots.....	80,762	85,089
Open-hearth steel ingots.....	146,946	160,542
Bessemer steel ingots.....	1,539,157	1,696,450
Blooms from ore and pig-iron	84,606	91,293

Digitized by Google

There was a large decrease in the production of iron rails in 1882 over that of 1881, and a small decrease in the production of open-hearth steel rails and crucible steel ingots; but in all the other articles enumerated, there was an increase in 1882 over 1881. With the single exception of pig-iron, however, this increase was in no instance large, and even in pig-iron it was only 11 per cent.

Imports of Iron and Steel.—The foreign value of the imports into the United States from all countries of iron and steel and manufactures thereof, including tin plates, has been as follows in the twelve years from 1871 to 1882. An increase in 1882 over 1881 will be noted in contrast with the marked decline in 1881 over 1880:

Years.	Values.	Years.	Values.
1871	$57,866,299	1877	$19,874,399
1872	75,617,677	1878	18,013,010
1873	60,005,538	1879	33,331,569
1874	37,652,192	1880	80,443,362
1875	27,363,101	1881	61,555,077
1876	20,016,603	1882	67,075,125

In the following table, we give the quantities of all the *leading* iron and steel products imported into the United States from all countries in the twelve years from 1871 to 1882, except steel in all forms other than rails, for which statistics of values only are obtainable, and which are included in the table given above.

The following table shows, in net tons, the details of our imports in the last five years:

Commodities Imported.	Net tons of 2000 pounds.				
	1878.	1879.	1880.	1881.	1882.
Pig-iron	74,484	340,672	784,968	520,835	604,978
Castings	69	61	114	632	2,079
Bar-iron	33,346	48,840	126,987	47,820	79,220
Boiler-iron	1	91	168	290	175
Band, hoop, and scroll-iron	7	1,031	25,322	827	6,021
Railroad bars of iron	....	19,090	132,459	137,013	41,992
Railroad bars of steel	10	25,057	158,230	249,308	182,135
Sheet-iron	838	5,459	11,412	8,121	12,985
Old and scrap-iron	6,225	248,429	694,273	151,107	164,591
Anchors, cables, chains, etc.	646	892	1,393	1,520	1,530
Tin plates	120,808	172,760	177,015	204,966	239,665
Total	236,434	862,352	2,112,341	1,322,439	1,335,371

The figures given in this table show a nominal increase in the tonnage of 1882 over that of 1881; but if the quantities as well as the values of all kinds of steel could be obtained, it would doubtless appear that the total tonnage of 1882 was greatly in excess of that of 1881. This will appear the more probable if we reflect that foreign values were lower in 1882 than in 1881. We know definitely that the importation of steel wire rods was much larger in 1882 than in 1881, aggregating in the former year probably 100,000 tons, the duty (30 per cent) being so low that our own steel wire rod mills were practically idle.

An increase in 1882 over 1881 is observable in all the articles named except boiler-iron and iron and steel rails. The decrease in rails was large—due mainly to the fact that our rail-producing capacity was more than equal in 1882 to the demand, whereas in the three preceding years it had been unequal to it.

Imports of Iron Ore.—The following statement shows the quantities and values of iron ore imported into the United States during the calendar years 1880, 1881, and 1882, by custom districts:

Districts.	1880.		1881.		1882.	
	Gross tons.	Values.	Gross tons.	Values.	Gross tons.	Values.
Baltimore	170,308	$506,560	375,798	$1,005,496	243,182	$654,629
Boston	2,155	13,359	716	2,867	1,664	3,322
Buffalo Creek	13,554	36,426	2,492	7,320	273	755
Champlain	.....	.....	.....	.....	2	7
Cuyahoga	13,858	48,463	10,500	37,675	9,420	33,181
Detroit	456	1,169	617	1,646	48	98
Genesee	5,390	16,274	8,716	25,961	6,851	21,651
Huron	72	258	264	770	264	677
Newark, N. J.	269	798	.....	.....	.....	.....
New York	148,987	432,678	196,419	641,344	145,909	421,776
Oswegatchie	7,553	21,052	3,418	10,650	905	2,783
Oswego	4,185	7,860	13,612	44,026	37,635	120,008
Perth Amboy, N. J.	5,444	15,968	13,671	48,323	31,558	101,859
Philadelphia	120,619	335,119	155,564	394,952	111,944	279,818
Puget's Sound	400	412	1,100	1,622	.....	.....
Cape Vincent	158	413	.....	.....	.....	.....
Total	493,408	$1,436,809	782,887	$2,222,652	589,655	$1,640,564

Previous to 1879, the importations of iron ore into this country did not exceed 100,000 tons annually. In that year, they amounted to 284,141 tons, valued at $681,467. In 1880, there was a large increase, and in 1881 a still larger increase, but in 1882 there was a decrease of nearly 200,000 tons. We anticipate in 1883 a continued decrease, owing partly to an increase in the duty after July 1st from 20 per cent to 75 cents a ton, and partly to the lowering of the prices for domestic ores and to the opening of new sources of domestic supply. It will doubtless happen, however, that we shall hereafter annually import from Spain and other countries a considerable quantity of foreign ore, for use in connection with our Bessemer steel-works, not specially because of its cheapness, but because of its richness and purity, in these respects surpassing the product of many American mines. A peculiarity of the trade in foreign ores is, that it would not probably have attained its recent proportions if it had not been profitable for European vessels which come to this country for grain to bring with them cargoes of iron ore in default of other freight.

A company of capitalists in this country has recently acquired possession of extensive deposits of iron ore of great richness and purity in the province of Santiago, in the southeastern part of Cuba, within four miles of the coast, and fifteen miles distant from the port of Santiago, where there is a good harbor. The company is known as the Juragua Iron Company, Limited, and its chairman is Dr. G. B. Linderman, of the Bethlehem Iron Company. Its acquisitions embrace several low mountains of slightly polarized hematite iron ore, which will average about 66 per cent of metallic iron and about ·025 of phosphorus. The ore is exposed in every direction, and can be mined, or rather moved, at slight cost. A railroad will be built from the mountains to the nearest point on the coast, or possibly to Santiago, and docks for the accommodation of vessels will also be constructed. The development of this important enterprise has already been actively commenced; but shipments of ore will probably not take place during the present year. The company will invest about a million dollars.

Domestic Exports of Iron and Steel.—The value of the exports from the United States to all countries of domestic iron and steel manufactures thereof in the twelve years from 1871 to 1882 was as follows:

Years.	Values.	Years.	Values.	Years.	Values.
1871	$11,836,137	1875	$16,092,906	1879	$12,470,448
1872	10,030,125	1876	11,798,459	1880	12,960,995
1873	12,129,939	1877	16,659,675	1881	15,782,202
1874	15,389,807	1878	13,200,369	1882	19,029,759

Bessemer Steel.—The production of Bessemer steel ingots in the United States in 1882 was 1,696,460 net tons, or 1,514,687 gross tons, an increase over 1881 of 157,293 net tons, or 140,440 gross tons. The increased production in 1881 over 1880 was 335,984 net tons, or 299,985 gross tons. A decided check to the progress of this great branch of our steel industry is discoverable in the figures of 1882. The production of Bessemer steel ingots in this country in the eleven years from 1872 to 1882 has been as follows, in net tons:

Years.	Net tons.	Years.	Net tons.
1872	120,108	1878	732,226
1873	170,652	1879	968,972
1874	191,933	1880	1,203,173
1875	375,517	1881	1,539,157
1876	525,996	1882	1,696,450
1877	560,587		

The works of the Colorado Coal and Iron Company, located at South Pueblo, Colorado, made their first blow on April 11th, 1882. The new works at Chicago, owned by the North Chicago Rolling-Mill Company, were first put in operation on June 14th, 1882; they are located at some distance from the company's old works, and hence virtually form a separate establishment, although not classified as such. New Bessemer steel-works at Scranton, Pennsylvania, are expected to go into operation this year; they made a trial heat on the 29th of March. A comprehensive exhibit of the fifteen Bessemer steel-works of the country which were completed on the 1st of April last is as follows:

Names of Companies.	Converters.
Albany & Rensselaer Iron and Steel Company, Troy, New York	two 7-ton
Bethlehem Iron Company, Bethlehem, Pennsylvania	four 7-ton
Pennsylvania Steel Company, Steelton, Pennsylvania	two 7-ton, three 8-ton
Lackawanna Iron and Coal Company, Scranton, Pennsylvania	two 5-ton
Scranton Steel Company, Scranton, Pennsylvania	two 4-ton
Cambria Iron Company, Johnstown, Pennsylvania	two 6½-ton
Carnegie Brothers & Co., Limited, Bessemer, Pennsylvania	three 10-ton
Pittsburg Bessemer Steel Company, Limited, Homestead, Pennsylvania	two 4-ton
Pittsburg Steel Casting Company, Pittsburg, Pennsylvania	one 5-ton
Cleveland Rolling-Mill Company, Cleveland, Ohio	two 10-ton
North Chicago Rolling-Mill Company, Chicago, Illinois (2 plants)	two 6-ton, three 10-ton
Union Iron and Steel Company, Chicago, Illinois	two 6-ton
Joliet Steel Company, Joliet, Illinois	two 5-ton
St. Louis Ore and Steel Company, St. Louis, Missouri	two 7-ton
Colorado Coal and Iron Company, South Pueblo, Colorado	two 5-ton
Total number of converters	38

The following table shows the production of Bessemer steel rails in the United States and Great Britain in the last three years:

Countries.	1880. Gross tons.	1881. Gross tons.	1882. Gross tons.
United States	852,196	1,187,770	1,284,067
Great Britain	739,910	1,023,740	1,235,785
Excess of United States	112,286	164,030	48,282

The following table shows the production of Bessemer steel ingots in the United States and Great Britain in the last three years:

Countries.	1880. Gross tons.	1881. Gross tons.	1882. Gross tons.
Great Britain	1,044,382	1,441,719	1,673,649
United States	1,074,262	1,374,247	1,514,687
Excess of United States	29,880	.....	.....
Excess of Great Britain	.....	67,472	158,962

Crucible Steel.—The production of crucible steel ingots in the United States in 1882 was 85,089 net tons, a decrease of 4673 tons upon the production of 89,762 tons in 1881. Here, again, we discover a check in 1882 to the progress of our steel industry. Seven States made crucible steel in 1882, namely, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Ohio, and Illinois.

The following table gives the production of crucible steel ingots in various sections of the country from 1874 to 1882, in net tons:

States.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.
New England	1,509	1,620	1,098	1,974	1,602	1,608	660	2,780	1,000
New York	2,696	2,300	2,300	2,032	2,800	2,300	3,500	4,961	4,693
New Jersey	8,164	7,098	6,806	6,749	7,377	8,651	10,387	14,500	12,400
Pennsylvania	23,289	26,615	28,217	27,983	30,585	43,614	57,077	66,290	65,139
Western States	570	1,500	700	1,400	480	605	800	1,231	1,857
Southern States	100	268	261	292	62	2	.....	.....	.....
Total	36,328	39,401	39,382	40,430	42,906	56,780	72,424	89,762	85,089

Open-Hearth Steel.—The production of open-hearth steel ingots in the United States in 1882 was 160,542 net tons, an increase of 13,596 tons upon the production of 146,946 tons in 1881. This was a much less proportionate increase than had taken place in any year since we first began to make open-hearth steel. The product of 1882 was made in eight States,

Digitized by Google

namely, New Hampshire, Vermont, Massachusetts, New Jersey, Pennsylvania, Ohio, Tennessee, and Illinois.

The following table gives the production of open-hearth steel ingots in the United States by districts from 1874 to 1882, in net tons:

STATES.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.

Blister, Puddled, and Patented Steel.—The following table gives the production of blister, puddled, and patented steel in the United States from 1874 to 1882, in net tons. It seems to be unnecessary to further continue from year to year the details of so unimportant a branch of our steel industry:

STATES.	1874.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.
New England.....	376	1,500	.....	.....	192	950	72	200	.....

Total.....	6,353	12,607	10,306	11,924	8,556	5,464	8,465	3,047	3,014

The small quantity of blister, puddled, and patented steel that was made in this country in 1882 was produced in Pennsylvania and Ohio.

Production of Bars, Shapes, Plates, Sheets, and other Rolled Iron in 1882.—In the term rolled iron we include (1) cut nails and spikes; (2) bar, shaped, bolt, rod, skelp, and hoop iron, and rolled axles; (3) plate and sheet-iron; and (4) all sizes of iron rails. Bessemer steel rails are not classed among rolled iron products.

The production of all kinds of rolled iron in the United States in 1882, including iron rails, was 2,493,831 net tons, against 2,643,927 tons in 1881, showing a decrease of 150,096 tons, all of which decrease is, however, accounted for by the great shrinkage in the production of iron rails in 1882. Omitting iron rails, the production of which decreased from 488,581 net tons in 1881 to 227,874 tons in 1882, our production of rolled iron in 1882 was 2,265,957 tons, against 2,155,346 tons in 1881, an increase of 110,611 tons. This was not a large increase; but if we consider the long strike of 1882 in the Pittsburg and Western rolling-mills, the wonder is, that there was any increase at all. At the same time, it must frankly be admitted that our rolling-mill capacity has for some time been in advance of the consumptive wants of the country, and that the check to the overproduction of rolled iron which was afforded by the strike of 1882 was in no sense a calamity to the manufacturers.

In the following table, we give detailed statistics of the production of the different forms of rolled iron in each of the States in 1882, in net tons:

STATES.	Bar, rod, bolt, hoop, skelp, and shaped iron. Net tons.	Plate and sheet-iron, except nail plate. Net tons.	CUT NAILS. Kegs.	CUT NAILS. Net tons.	Iron rails. Net tons.	Total. Net tons.

Forges and Bloomaries in 1882.—As we have heretofore explained, blooms and billets from ore are made chiefly in the Champlain District of New York, and blooms from pig and scrap-iron are made chiefly in Pennsylvania. There has been a steady increase in their production in the last four years.

The following table shows the proportion of ore blooms and billets made in New York in the past eight years, and the proportion of pig and scrap blooms made in Pennsylvania in the same time:

YEAR.	NET TONS OF 2000 POUNDS. Ore blooms and billets made in New York.	Total make of ore blooms and billets.	Pig and scrap blooms made in Pennsylvania.	Total make of pig and scrap blooms.
1875.....	23,666	24,416	19,032	24,827

AN ELECTRIC WIRE TRAMWAY.

"Telpherage" is the name given by Mr. Fleeming Jenkin, the well-known electrician and professor of civil engineering in the University of Edinburgh, to a system which he has devised for transporting vehicles, containing goods and passengers, to a distance by the electric current independently of any control exercised from the vehicles themselves.

The system, says *Engineering*, has been patented, and it is to be hoped that a practical trial of it will soon be made. Professor Jenkin's idea is to employ strained metal cables, which will serve both to sustain the load and convey the electric current. The frames or trucks supporting the load run along the cable on wheels, and the cars or loads are suspended below them from the axles of the wheels.

In the simplest arrangement of the line, there is a break of continuity at each post supporting it; and the sections of cable are themselves insulated from each other and the earth. They are, however, capable of being connected by movable coupling-pieces, actuated by the train, so that all the sections receive the exciting current and form part of the general circuit.

The current is supplied to the line by a stationary dynamo-electric machine driven by a steam-engine or other motor; and since the line is elevated from the ground on insulating standards, the same dynamo will supply a considerable length of line, as the leakage need not be excessive if proper precautions are taken. With ground lines of electric railroad, like that of Siemens or Edison, the leakage is very marked, and Mr. Edison has adopted the plan of dividing the whole line into short sections of a few miles, with stations and feeding dynamos at each. Dr. Werner Siemens favors the use of an insulated conductor supported beside the line, and giving current to the motor on the train by means of a running connection pulled by the train. Professors Ayrton and Perry have, as is well known, sought to overcome the leakage difficulty by making the line in short sections, each of which is put in circuit with the dynamo in turn as the train progresses, by an automatic action of the train itself. In this way, there is only one section electrified at a time, namely, that over which the train is running, and the leakage on the whole line is consequently very small.

The loads or cars on the telpherage line are connected together in trains, and the length of a train is nearly the length of a section of the cable or conductor. On passing either of the movable coupling pieces between two sections, the train throws it out of action, disconnecting the two sections at that point; but the circuit between these sections is maintained through the wheels of the train itself and a conductor on the train. In circuit with this conductor is a dynamo-electric motor, which is actuated by the current, and propels the train by driving the wheels. The power provided is more than sufficient to keep up a maximum speed, and the train is provided with a governor which, when the speed is sufficient, closes a shunt and allows the current to pass without traversing the coils of the electromotor. The governor acts directly to check the train if the speed becomes excessive, by short-circuiting the electro-motor, or otherwise bringing electric brakes into operation.

To further insure that one train shall not overtake another, Professor Jenkin provides an automatic telegraphic communication along the line, and the trains in passing close and open the telegraphic circuits. This automatic telegraph actuates circuit-closers between the different sections of the main cable or conductor so as to maintain connection between the sections for a certain distance behind the train quite independently, it may be, of the movable coupling-pieces. It is obvious that a following train entering upon a part of the line in which the sections are thus connected will have its speed checked, as the application of the power upon the train depends upon there being a break in the electrical coupling between the two sections on which the train is for the moment supported.

AN IMPROVED BELL TELEPHONE.—M. d'Arsonval, the well-known telephonist, has devised a new form of Bell receiver, which is, for its size, and weight, the most powerful yet constructed. The chief modification consists in inclosing the bobbin entirely between the poles of the magnet. This is done by making one pole of the magnet the core of the bobbin, and the other pole an inclosing ring of iron. The inductive plate vibrates over the poles and upper surfaces of the coil as before. The complete instrument only weighs a little over five ounces, and is stated to be as powerful as the heavy Gower-Bell receiver. Mr. Leczensky has applied magnets of steel tempered by compression after the manner introduced by M. Clemandot, and since this mode of tempering does not deform the magnets, a neater article is the result.

MECHANICAL TESTS OF COMPRESSED STEEL SHAFTING.

In our report on the visits made by the American Institute of Mining Engineers to the various works in the vicinity of Boston, during the annual meeting held in that city, we referred briefly to a department in the Norway Iron and Steel-Works of Messrs. Naylor & Co., where steel was drawn cold in accordance with the patents of Mr. G. H. Billings, We then spoke of the simplicity of the plant for cold-drawing and compressing steel, and cold-straightening the compressed bars which are principally used for shafting, it being possible to produce regular and irregular sections within the range of ⅜ and 3-inch. As throwing much light upon the mechanical qualities of the metal thus treated, we have just received a series of tests made by Mr. J. E. Howard, with the great Emery machine at the Watertown Arsenal, which, with earlier experiments on torsional strength, conducted by Prof. J. E. Denton, at the Stevens Institute of Technology, clearly show the improvement due to the method of working.

Turning first to the Watertown tests, we find that three tests by tension and two by compression were made, the specimens being cut from the same original bar of hot-rolled steel, and beat out before and after being cold-drawn. Mr. Howard's record of tests is very complete, giving the elongation as every increment of load was applied. We have chosen from the detailed tables those figures which mark prominent points in the progressive alterations of the bars under stress. Beginning with the steel bar, as it came from the rolls, with its surface in the condition it left them, and therefore showing the mechanical properties of the metal before compression by cold-drawing, we have the following:

Original Bar.—Total length, 66·55 inches; diameter, 2·03 inches; sectional area, 3·24 square inches; distance between holder-jaws, 45 inches; gauged length, 30 inches; eight five-inch sections laid off in bar.

Loads Applied.		Elongation. Inches.	Permanent set. Inches.
Total pounds.	Pounds per square inch.		
3,240	1,000	.....	.....

0	0	**7·16 (23·9 p.c.)**	.....

The elongation was therefore 23·9 per cent, and as the diameter at fracture was 1·54 inches, the area being 1·86 square inches, the contraction of area was 42·9 per cent. The elongation of the eight five-inch sections was respectively 0·87, 0·97, 1·03, 1·17, 1·73 (fractured section), 1·13, 1·13, and 1·06 inches. The fracture was oblique, its appearance being silky, with round spots from one sixteenth to one tenth of an inch in diameter each, about the center, presenting small bright facets.

Cold-Drawn Compressed Bar.—By one pass through the dies, the diameter of the above bar had been reduced 0·094 inch, leaving it 1·936 inches, with an area of 2·946 square inches. The total length of the bar was 59·30 inches; the distance between the holder-jaws 37 inches; and the gauged length, 20 inches. Six five-inch sections were laid off on the bar.

A glance at these figures, compared with those obtained in treating the rolled bar previous to compression, furnishes an eloquent proof of its effect upon the mechanical qualities of the metal. The diameter of the above bar at the fracture was 1·58 inches, the area being 1·96 inches, thus making the contraction of area 33·5 per cent. The fracture was oblique, the bar breaking 4½ inches from the face of the holder-jaws. In appearance, it was silky, round spots from one sixteenth to one eighth in diameter, with bright facets noticed near the center of the fracture. The elongation of the six five-inch sections was respectively, 0·10, 0·11, 0·12, 0·13, 0·18, and 0·78 inch (the latter the fractured section).

Cold-Drawn Compressed Bar.—The third bar tested was reduced in diameter by drawing through the compressing dies once, much more than the second, the reduction being 0·222 inch, leaving the diameter of the bar 1·808 inch, and its area 2·567 square inches. The total length of the bar was 61·04 inches, its gauged length 20 inches, and the distance between the holder-jars 39·50 inches. Six five-inch sections were laid off on the bar.

.....	.....	**0·15 (75 p. c)**	.....

The elastic limit was not well defined. The diameter of the bar at the fracture was 1·65 inches, and the area 2·138 square inches, making the contraction of area 16·7 per cent. The bar broke square across, one inch inside the face of the holder-jaws, the fracture being finely granular, with a silky spot in the center one quarter by one half an inch in size. The elongation of the different five-inch sections was 0·04, 0·4, 0·03, 0·05, and 0·06 inch respectively.

Compression Tests.—Two tests of the last bar were made with the following results, the diameter of the specimen being 1·808 inches; the sectional area, 2·567 square inches; and the length, 3·976 inches. The compression measurements were taken with a screw micrometer 12 inches between center punch marks:

Loads Applied.		No. 1.		No. 2.	
Total tons.	Pounds per square inch.	Compression. Inches.	Compression sets. Inches.	Compression. Inches.	Compression sets. Inches
2,567	1,000	0	.....	0	.....

THE LINKENBACH BUDDLE.*

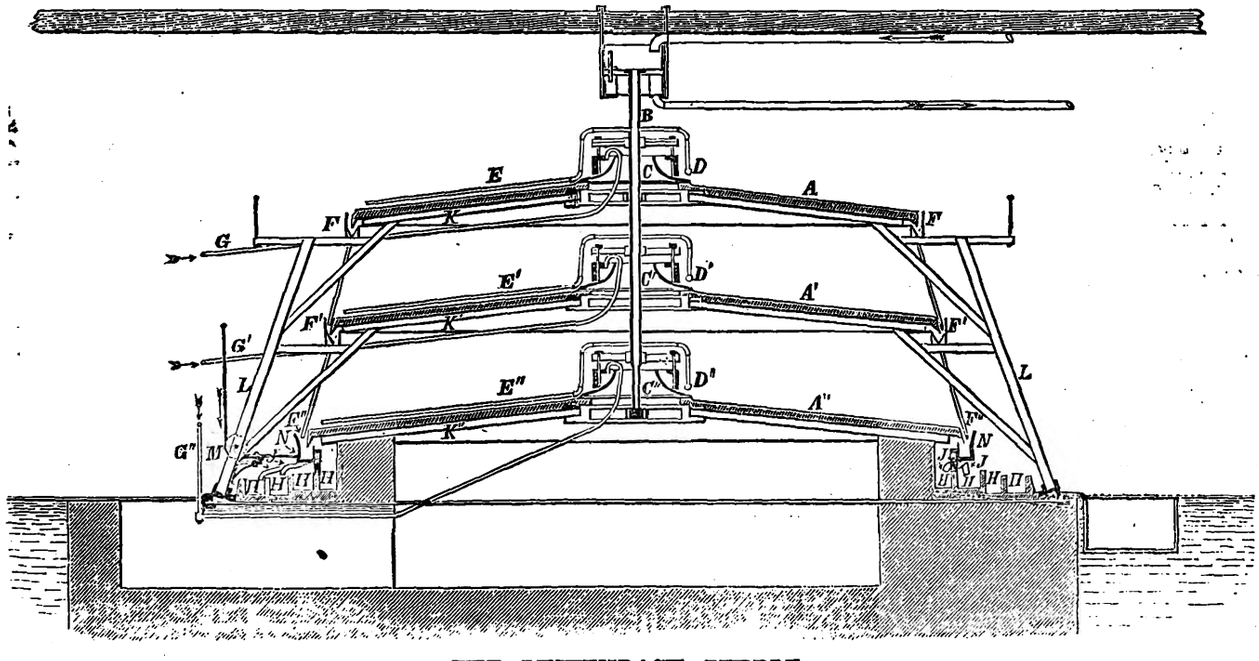
By Richard P. Rothwell.

Revolving slime-tables with stationary sprays and oscillating brushes have for many years been a favorite apparatus used for working slimes in German dressing-works, often displacing Rittinger tables and the many variations of Cornish buddles. The difficulty of building these tables larger than 5½ meters (17 feet) in diameter, increasing the cost and making them unwieldy, rendered it necessary also to concentrate the slimes in several operations, because the travel over so short a length of hearth would not suffice for close concentration.

A preliminary sizing is effected in a system of spitzkasten. Herr C. Linkenbach, general manager of the Ems Lead and Silver-Works, Germany, devised a buddle in 1878, which has since worked well and found much favor in Germany, and has in one instance been copied here, at Colorado Springs, without any credit having been given to the original inventor. Herr Linkenbach's plan has been to reverse the functions of the table and the washing apparatus of the old German revolving table. He makes the tables stationary and rotates the washing apparatus, thus enabling him to save in power, and, within certain limits, to increase the dimensions of the table, without in any way affecting its durability or materially increasing its cost.

In its earlier form, the buddle was single, and that type is still desirable when only small quantities of slime are to be worked. In order to secure economy in floor space and cheapen the first cost, by having a single foundation and only one set of rotating mechanisms, Mr. Linkenbach now builds the buddles in sets of three, one above the other, as shown in the accompanying drawing. The following figures, giving the cost of a single and a triple buddle at Ems, will fully illustrate this point. In order that these figures may be available under other conditions of cost of labor and materials, I may state that at Ems the cost of labor per shift was 2·80 marks (70 cents); the cost of 1000 kilogs. (1 ton) of wrought-iron, 180 marks ($45), and of cast-iron 170 marks ($42.50); of 1000 brick, 27 marks ($6.75); and 1000 kilograms cement, 50 marks ($12.50).

	Single.	Triple.
Foundation-work	238·18	296·56
Masonry and cement-work	1,075·86	2,279·48
Iron-work	2,010·07	6,451·10
Total	3,324·11	9,027·14
	$831	$2257



It will be noticed that there is very little difference in the cost of foundation; that the cost of masonry is only doubled; while the cost of the iron-work is more than trebled in the triple-hearth buddle. The cost of a single buddle is therefore 3324·11 marks = $831, against 9027 marks = $2257, for one of the triple buddles, not taking into account the saving in floor space and the consequent economy in construction of building, or the saving in driving gear.

I will therefore confine myself to a description of the latter form, the principle involved being the same and the connection requiring only a few necessary changes in detail skillfully carried out. As will be seen from the section, there are three stationary tables, the upper one *A* having a diameter of 6 meters (19·7 feet); the middle one *A'* of 6·5 meters (21·3 feet); and the lower table *A''* of 7 meters (23 feet). The first receives the coarsest grades of the slimes, while the lowest washes the finest sizes; the middle table taking intermediate grades. The tables themselves are made of a skeleton of wrought-iron, the upper surface being cement. The central hollow shaft *B* rotates, carrying with it the distributors *C*, *C'*, and *C''*, the washing-pipes *D*, *D'*, and *D''*, the cleaning-jets *E*, *E'*, and *E''*, and the rotating catch-gutter *F'''* of the lowest table, while the catch-gutters *F* and *F'* are stationary. The slimes, coming from a separate spitzkasten for each table, are delivered by the pipes *G*, *G'*, and *G''*.

The action of the buddle is simple. The slimes, flowing continuously over the tables, are first met by a current of water from the washing-pipes *D*, which carries off the middlings, the tailings having flowed off the table before the washing water reaches it. When the spray jets *E* reach the point of the table passed by the washing-pipes, the headings are flooded off the table. The various grades of concentrates are kept separate by the four gutters *H* and the rotating catch-gutter *F'''*, by means of pipes *J*, varying in length. The tailings, middlings, and headings from the lower table flow upon the rotating catch-board, which has adjustable compartments for their reception. Those from the other two tables go to stationary circular catch-gutters *F* and *F'*. The bottom of the latter consists of a series of funnels closely placed, the bottoms of which connect with pipes leading to the lower rotating catch-gutters. From the different compartments of the latter, the headings, middlings, and tailings are taken by the pipes to the gutters *H*.

With a single-table buddle, from 5200 to 6600 kilograms (from 5½ to 7 tons) of slimes, weighed dry, have been worked in a ten-hour shift, the percentage of material in the slimes being about 5½ per cent, the quantity of water used being from 90 to 100 liters (from 19 to 22 gallons) per minute, of which two thirds were used by the washing-troughs and one third by the spray. The lead headings produced assayed 40 per cent of lead, further enrichment not being considered desirable, because the foreign matter in the concentrates was hematite and spathic iron ore. The tailings yielded by wet assay from 0·75 to 1 per cent of lead.

On the triple buddle, slimes containing galena and blende were worked at Ems to the extent of from 6000 to 7000 kilograms (from 6½ to 7½ tons) per table per ten-hour shift. The consumption of water per minute was from 110 to 120 liters, the proportion of water from the troughs and the jets being 2·25 to 1. The galena headings run from 55 to 60 per cent, while the blende concentrates contain from 40 to 42 per cent of zinc, and the tailings hold by wet assay from 1 to 1·25 per cent of lead and from 2 to 2½ per cent of zinc.

THE LINKENBACH BUDDLE.

Among the great advantages this buddle possesses are, the possibility of making and maintaining the table perfectly true, great simplicity of construction, great durability, perfect control of the water and of the degree of concentration as well as of the number of classes into which the ore is to be made, and economy in space and in first cost.

* A paper read at the Boston Meeting of the American Institute of Mining Engineers.

THE BRITISH MANUFACTURED IRON TRADE IN 1882.

Mr. J. S. Jeans, the Secretary of the British Iron Trade Association, has just published the following detailed statistics of the manufactured iron trade in Great Britain for 1882, from which we extract the following:

The production of puddled bar in the United Kingdom during 1882 amounted to 2,841,534 tons, against 2,681,150 tons in the preceding year, the increase being thus 160,384 tons. It is noticeable that this would be a larger increase than that which has occurred in the production of pig-iron for the same period; but the figures given for 1881 in respect to the North of England are subject to the modification that they refer to manufactured iron only, while those for 1882 apply to puddled bar; and as the quantity of the latter produced in 1882 was more than 100,000 tons in excess of the make of finished iron, a nearly corresponding increase of puddled bar may be assumed for the former year.

The total number of puddling-furnaces in operation at the end of 1882 was 4369, being 814 less than in the preceding year. A statement of the number of furnaces in activity in each district at the end of 1882, and the average production per furnace, appears below.

In reference to this statement, it must be remembered, however, that the number of furnaces in activity throughout the year varies considerably in every district, and the number working on December 31st can not be accepted as a fair average of the whole year. This fact will explain the high averages returned for Lancashire and West Cumberland. It is also necessary to explain that in some cases large quanties of scrap, etc., are worked up, and the products of ball furnaces are included with

Digitized by Google

"puddled bars." Even so, however, the Lancashire works have an exceptionally good record, and the results they have achieved seem to indicate a substantial improvement on the average yields of a few years ago.

AVERAGE ANNUAL PRODUCTION PER PUDDLING-FURNACE, RECKONED ON THE NUMBER OF FURNACES AT WORK IN DECEMBER, 1882.

District.	Production of puddled bar. Tons.	No. of puddling-furnaces active.	Average annual production per furnace. Tons.
Cleveland	852,199	1,236	689
South Staffordshire	660,326	1,115	592
Lancashire	277,476	313*	886
South Wales	213,179	270	789
Scotland	210,300	300	701
North Staffordshire	195,471	362	539
South Yorkshire	162,159	271	583
West Yorkshire	102,921	180	571
Shropshire	88,937	163	545
Derbyshire	40,226	88	457
Cumberland	23,040	28	823
Other districts	15,300	36	425
Total	2,841,534	4,369	650

The decline in the total number of puddling-furnaces during the last few years has been considerable. The figures issued by the Mining Record Office show that, in 1860, the total number of puddling-furnaces in the United Kingdom was 3462; in 1864, 6338; in 1868, 5903; and in 1872, 7311. The latter was the greatest number returned in any one year. In 1874, the number had declined to 6803, and in 1877 it rose again to 7159. The total number of furnaces returned for 1882—6296—is 101 less than that for the preceding year. The number of furnaces in actual operation at the end of 1882 was 814 less than that returned for the corresponding date in 1881; but of these, a good many had probably been working over a certain part of the year. This is, indeed, made tolerably evident by the greater production of 1882. Assuming that 10 per cent of the furnaces constructed are usually out of work for purposes of repair, etc.—which is the calculation generally accepted by the trade—it would appear that of the remainder 21 per cent of the furnaces were inoperative on account of the condition of trade, and of that proportion probably two thirds will not again be lighted up. Appended are the statistics of puddling-furnaces for 1882:

NUMBER OF PUDDLING-FURNACES, ACTIVE AND INOPERATIVE, IN THE UNITED KINGDOM AND IN EACH DISTRICT THEREOF IN 1882.

District.	No. of puddling-furnaces. Active.	Inoperative.	Total furnaces.	Percentage of total in activity.
Cleveland	1,236	555	1,791	69·01
South Staffordshire	1,115	605	1,720	64·82
Lancashire	313	49	362	86·46
South Wales	270	412	682	39·58
Scotland	300	80	380	78·94
North Staffordshire	362	48	410	88·29
South Yorkshire	278	59	337	82·49
West Yorkshire	180	22	202	89·10
Shropshire	163	35	198	82·32
Cumberland	28	12	40	70·00
Derbyshire	88	8	96	91·66
Other districts	36	42	78	46·15
Total	4,389	1,927	6,296	69·39

The following is a summary of the returns received by the Association of the different descriptions of manufactured iron produced in 1882. In reference to these figures, it has again to be remarked that they are far from being complete. Many firms, indeed, make up no record of the different descriptions of finished iron which they produce, but are content to divide their return into the two items of "puddled bar" and "finished iron." The figures that have been obtained, however, may be accepted as to some extent a guide to the proportions of the different leading productions from puddled bar.

PRODUCTION OF DIFFERENT DESCRIPTIONS OF MANUFACTURED IRON IN 1882.

Descriptions.	Production, tons.	Percentage total production.
Ship-plates	495,000	30·53
Angles	169,000	10·42
Bars	434,200	26·78
Rails	60,339	3·72
Sheets	114,200	7·04
Hoops	71,000	4·38
Wire rods	81,000	4·99
Coke bars (for tin plates)	35,000	2·15
Strips	42,600	2·62
Tee iron	21,720	1·33
Packing iron	3,500	·21
Fencing-wire	10,800	·66
Nail-rods	18,600	1·14
Boiler and other plates	64,000	3·94
Total	1,620,959	99·91

There are no reliable statistics of the production and consumption of coke in the United Kingdom; but the demand for this form of fuel is known to have very largely increased within the last few years. This has chiefly been due to the development of the iron trade; but the demands for locomotive and export purposes have also been extended in a material degree. The economies that have been introduced in blast-furnace practice have, however, so considerably reduced the consumption of fuel per ton of iron smelted that the effect of the greatly increased production of pig has not been so apparent in this industry as it otherwise would have been. The following figures show what the consumption of coke would be in the manufacture of pig-iron in 1882 compared with 1879, assuming for each year an average of 23 cwt. of coke per ton of pig:

Consumption of coke in 1879 ..... 5,822,834 tons.
Consumption of coke in 1882 ..... 8,472,378 "

These figures show an increase of 2,649,544 tons, or 45 per cent, within four years; but it should be noted that the average consumption per ton of pig is likely to have been higher in 1879 than in 1882, because of the extensive introduction of more economical blast-heating apparatus, and also because of the much larger make of hematite relatively to other qualities of iron in the latter year. The difference, therefore, against 1879 is likely to have been even greater than the foregoing figures indicate.

The consumption of coke in the manufacture of pig-iron in 1882 was as follows, both as coke and in the form of coal, Scotland being of course excluded, in consequence of the general use of raw coal in the blast-furnaces of that country:

	Tons.
Consumption of coke	8,472,378
Equivalent of coal, taking 60 per cent of coke as 100 per cent of coal	14,120,627
Add coal consumed in Scotland, say	2,300,000—16,420,627

It is probable that the average yield of the United Kingdom will be nearer 56 or 57 per cent of coke per 100 of coal, 60 per cent being, indeed, about the best average result that is obtained in the coke manufacture. It is probable, also, that the average consumption of coke per ton of pig made will, in the country generally, be nearer 25 than 23 cwt. The foregoing table is, therefore, subject to these two modifications.

* Includes some double reckoned as colliery furnaces.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

Lode versus Placer Claims—The Shonbar, of Butte, Mont.—Secretary Teller has just rendered the following decision, in a letter directed to the Commissioner of the General Land-Office:

I have considered the appeal of Anthony H. Barret *et al.*, applicants for patent for the Shonbar lode, from your decision of March 28th and June 3d, 1882, the former holding their Helena, Montana, mineral entry, No. 611, of the premises for cancellation, and the latter declining to recall the former. You hold the entry for cancellation because the ground covered thereby had been previously patented as placer claims upon mineral entries numbered 375 and 553, per patents issued April 15th and May 16th, 1881, respectively. It appears that said applicants located their claims May 5th, 1879, filed application for patent November 2d, 1880, notice whereof was regularly published from November 5th to January 6th, 1881, whereupon they made mineral entry No. 611, January 14th, 1881. Their application calls for "1497 linear feet of the Shonbar vein, lode, or deposit, bearing silver and other metals, together with surface ground varying from 464 to 538 feet in width, . . . being situated in the Summit Valley Mining District, county of Deer Lodge, Territory of Montana." Such claim is designated as "Lot No. 175," containing an area of 17·19 acres, and is so delineated by the official survey thereof made by U. S. Deputy Mineral Surveyor Baker, June 26th, 1881, plot whereof was approved by U. S. Surveyor-General Mason, September 3d, ensuing. These applicants claim to have acquired title "by purchase from original locators." It further appears that, under date of May 29th, 1882, the applicants' attorney filed in their behalf the affidavits of certain persons resident in said district, alleging that the Shonbar lode is a well-defined vein, rich in minerals; that its existence was known at and long anterior to the date of said placer application. Wherefore said attorney requested that your former decision be recalled, that patent issue for the Shonbar lode claim; but by your decision of June 3d, 1882, you declined to recall your former decision, holding the matter to be beyond the jurisdiction of your office.

This case, so far as it relates to the existence of a known lode, is within the rule established by this department under date of the 19th proximo, in the matter of the Mammoth quartz mine, wherein it was ordered that the lode claimants be permitted to proceed, pursuant to statutory provisions, by application for patent upon the lode claim, by regular publication, subject to the filing of an adverse claim and the institution of suit in a court of competent jurisdiction. But the present claim exceeds twenty-five feet in width on each side of the vein. The application has been allowed, publication regularly had, and the entry made. In fact, said claimants had completed their proof, and the same were matter of record in your office for several months prior to the issuance of placer patents, and no adverse claim was filed. It would not be practicable, therefore, at this stage of the cause, to remit these claimants to the performance, *de novo*, of such preliminary requirements. In the absence of an adverse claim, they are entitled to take their lode and twenty-five feet on each side. The only question remaining is, whether or not the excess over that width of surface-ground can be allowed. I think this can not be done. The lode claimants, in order to protect their right to the full extent of their claims, should have filed adversely to the placer application within the statutory periods; but having failed so to do, they are expressly restricted by the statute to their lode, "and twenty-five feet of surface on each side thereof."

Your decision is accordingly reversed; and if, on examination, the proofs are found regular and sufficient, you will require a corrected plot, properly defining the restricted surface-ground, upon which patent will issue.

BASIC FURNACE LININGS.—Kutscha, Oehlwein, and Mertens recommend for furnace linings the use of the mineral agalmatolite, occurring at Dilln, near Schemnitz, in Hungary. Its composition is: Silicic acid, 30·40; alumina, 52·68; iron oxide, 0·80; manganese oxide, 0·30; lime, 0·89; magnesia, 0·39; sulphuric acid, 0·80; water, 11·88; alkalies, 1·50; total, 99·64. By mixing two parts of burnt agalmatolite with one of the raw mineral, and moistening the mass with water, the mixture may be pressed into briquettes, which, on burning at a white heat, become hard and adhesive, and do not shrink. For the preparation of basic linings, it is proposed to add to lime or dolomite a flux in such proportion that the mixture after twelve hours' burning at a white heat forms a slag which is pulverized and worked up with suitable binding agents. For the manufacture of such basic refractory masses, dolomite of the following composition is used: Silicic acid, 0·7; alumina, 0·5; iron oxide, 0·6; lime, 31·5; magnesia, 20·0; carbonic acid, 46·7; mixed with 12 per cent of talc of the composition: Silicic acid, 62·0; magnesia, 31·0; iron oxide, 2·0; water, 5·0. The mixture is formed into bricks, heated for twelve hours at a white heat, pulverized, treated with from 5 to 8 per cent of tar, from 3 to 5 per cent of pitch, or from 5 to 10 per cent of resin, pressed while hot in heated molds, and burnt at a high temperature. Bollinger recommends the use of a mixture of asbestos, chrysolite, and magnesium chloride for the preparation of refractory basic linings.

OUR EXPORTS OF MANUFACTURES OF IRON AND STEEL.

The Bureau of Statistics has just issued a quarterly report, in which we find a series of interesting figures relating to our trade in manufactures of iron and steel with Mexico, the West Indies, and South America. We give below the exports to those countries for the past three calendar years:

To	1880.	1881.	1882.
Mexico	$1,257,574	$2,582,246	$4,239,712
Central American States	211,609	188,847	244,781
British Honduras	22,180	27,484	27,552
Danish West Indies	17,070	24,985	26,397
British West Indies	125,748	148,466	145,526
Hayti	74,593	73,355	58,496
San Domingo	221,151	106,261	138,889
Cuba	1,396,288	1,184,512	1,679,677
Porto Rico	128,031	110,289	84,038
Argentine Republic	168,418	272,175	440,201
Brazil	884,655	861,329	772,372
Chili	166,728	219,595	331,648
Peru	103,786	2,712	49,347
United States of Colombia	1,322,596	1,030,983	1,155,827
Uraguay	64,122	111,568	158,174
Venezuela	163,942	278,996	196,622

An idea of our share in the total trade of the countries mentioned in manufactures of iron and steel may be gathered from the following figures of the imports of these States from Great Britain and France during the calendar year 1881:

	Great Britain.	France.
Mexico	$2,653,078	$152,414
Central American States	404,304	14,019
Colombia	332,942	148,648
Venezuela	160,254	10,988
Brazil	6,657,839	492,648
Uruguay	244,834	518,856
Argentine Republic	3,754,836	557,891
Chili	1,956,839	124,446
Peru	366,404	.....

THAT coal mining is occasionally an exceedingly profitable undertaking, is shown by a few figures contained in a statement made recently by the receiver of the great Ohio iron firm, Brown, Bonnell & Co., of Youngstown. Among the assets figure the following items: "Mahoning Coal Company, incorporated 1862, block coal mine, Brookfield, Ohio, four sevenths of the stock owned by Brown, Bonnell & Co.; their share in the profits in 1881 was $80,000, and in 1882, $47,000; stands in ledger at cost of $275,000."

The same concern possessed full control of the Mahoning Coal Company at Dunbar, Pa., having a territory of 185 acres of coal and 100 coke-ovens, capable of producing 4000 tons of coke per month, the whole costing $80,000.

AN IMPORTANT PATENT DECISION.—The Secretary of the Interior has confirmed the decision of the Commissioner of Patents, holding that he has authority to institute proceedings like those in interference cases, to obtain testimony upon which to determine whether an invention has been in public use or on sale for two years, or more prior to the filing of an application for a patent therefor. Under this decision, a new practice will be established in the Patent-Office, substantially as follows: Where a petition is presented asking that an investigation be made to determine whether an invention which is the subject of an application for a patent has been in public use for two years, the Commissioner will direct the Examiner of Interferences to fix a time for taking testimony by the petitioner to show the facts alleged in the petition, giving thirty days for the production of such testimony. At the expiration of that time, the inventor or his assignee may produce testimony to show that the facts alleged are not true. The testimony will be returned to the Patent-Office and considered in the same manner as testimony taken in interference cases.

PIG-IRON AND IRON ORE IN LUXEMBURG.—Official statistics have been issued relative to the iron and mining production in the Grand Duchy of Luxemburg during the year 1882. The following is a table of the output of iron ore, its value, and the persons employed at the mines in 1882, as compared with 1880 and 1881:

	1882.	1881.	1880.
Production, tons	2,539,295	2,161,881	2,173,463
Value, francs	7,336,536	6,205,469	6,538,544
Persons employed	3,775	3,434	3,656

It is thus seen that the output, which showed a small decrease in 1881, has increased very largely. The statistics of the pig-iron trade are:

	1882.	1881.	1880.
Production of pigs, tons	376,587	293,616	263,666
Value, francs	21,345,700	14,136,667	14,445,282
Weeks of work	832	596	643
Persons employed	1,529	1,478	1,328
Blast-furnaces in operation	16	16	15

THE COST OF ELECTRIC LIGHTING.—The whole problem of electric lighting having been reduced to the question of cost, all reliable calculations based on actual results must be welcome. On the 1st of January, 1882, a large railroad station in California was lighted by a local branch of the Brush Electric Light Company. The dynamo was made to furnish forty lights, and worked by a fifty horse-power engine. Every thing was made of the best material and put up by experienced workmen. Allowing six months to pass, so as to permit the expenses to be cut down to a minimum, and the employés to be trained to the best efficiency, calculations were made for the months of June, July, August, and September, 1882, with the following result:

Average cost per month	$525.52
Average cost per night	17.06
Average number of lights nightly	30.09
Average hours of lighting nightly	5
Average cost of one light nightly	55 cts.
Average cost per light per hour	11 cts.

Mr. Samuel Purnell, who makes this report, comes to the following conclusion: He states that the local opinion was, that while the station was brilliantly illuminated by electricity, and better than gas could possibly do it, yet that sufficient light could have been obtained from gas for half the money.

FURNACE, MILL, AND FACTORY.

An additional set of sheet-iron rolls, a box-furnace for annealing iron, a scrap-furnace, and a set of new boilers will be erected in the mill of Summers Brothers & Co., at Youngstown, Ohio, this spring.

A factory for the manufacture of wire netting and screens, with a capacity of fifteen looms, is nearly completed at Milford, N. J.

The old puddle-mill of the Co-operative Iron and Steel-Works at Danville, Pa., is undergoing transformation into an open-hearth steel plant, and will probably be at work on the new product next month.

From the report made at the recent meeting of the Western Pig-Iron Association, at Pittsburg, it appears that the stock on hand at the close of 1882 was 420,694 tons, against 210,896 tons in 1881, and 456,658 tons in 1880. Of the whole supply on hand at the beginning of the present year, Pennsylvania held 150,858 tons and Ohio 187,253 tons.

The Clara Furnace, of Rayney & Berger, at Newcastle, Pa., has blown out for repairs, which will probably require two months.

Ground has been broken at Cranberry, Pa., for a new furnace. The ore mined at that place has been tested and found to produce a first-class Bessemer pig, said to be equal to that of any of the foreign ore imported into this country.

The Lancaster Rolling-Mill, located at Rohrerstown, Lancaster County, Pa., was sold at assignee's sale on Friday. It was purchased by George Youtz for $18,000. The property consists of two and three quarter acres of land, on which is a rolling-mill, 175 by 90 feet, containing seven puddling-furnaces, heating-furnaces, three steam-engines, and other necessary machinery. There are on the lot also two frame tenant-houses and other improvements.

The Southwark Foundry and Machine Company, of Philadelphia, has recently added to its machine-shops a large extension, and has filled it with the best machine tools obtainable in this country and in England. The manufacture of the Porter-Allen engine is vigorously prosecuted, and the company has adopted the specialties of hydraulic machines, including steam-pumps, passenger elevators, water-works, pumping engines, etc. The Southwark Company is now building a number of large Porter-Allen engines for the leading rolling-mills of the country. At the Cambria, Otis (Bethlehem), Albany & Rensselaer, Edgar Thomson, Indianapolis, Springfield, and Lackawanna works, these engines have made an excellent record. The great obstacle to the universal introduction of these engines hitherto has been the greater cost of the smaller sizes, compared with other engines of equal power of first-class makers. The Porter-Allen engines, above 250 horse-power, however, it is stated, cost less, power for power, than any other first-class engine. The old prejudices against high-speed engines are fast disappearing. The cost of construction, also, is now largely modified by new economic methods, and the rigid system rendered practicable, by the increase in the number of engines built. Where a single engine of a certain size was built alone, it was impossible to attain the same or as approximate an economy as when a number were ordered of exactly the same dimensions in all their parts. This point has now been reached, and we are informed that the Porter-Allen engines can be sold for about the same price as other first-class engines. The company has in process of construction several rolling-mill engines of large size, besides a number of smaller sizes for a variety of other duties. Three blowing-engines for blast-furnaces, several hydraulic passenger and freight-elevators, and pumps of various sizes are built with much other heavy work of varied character. The company also has the exclusive right of manufacture for the United States of the automatic ice-machine, an apparatus simple in construction and efficient for making ice and refrigerating apartments. It is the purpose of the company to carry on the manufacture of the Porter-Allen engines as its prime specialty; but to engage, in conjunction with it, in the construction of other heavy machinery.

The Pulsometer Steam Pump Company, on account of increased facilities for manufacturing, has lately reduced the price-list of the new pulsometer steam-pumps about one third. The company lately sent one of its hydraulic engineers to New Orleans, La., to superintend the running of one of its pumps on exhibition at the headquarters of its agents, Messrs. H. Dudley Coleman & Brother. Among the orders he obtained while there was a contract to supply a full plant of new pulsometers, boilers, etc., for irrigating a tract of land in Mexico, 40 by 25 miles square.

Two new blowing-engines are building for the furnaces of the Bethlehem Iron Company.

The Clemens Foundry and Machine Company, of Ansonia, Conn., has contracted with the Winchester Repeating Arms Company to furnish all the necessary machinery for the completion of its new brass rolling-mill.

The South Pueblo Machinery Company and the South Pueblo Manufacturing Company, both of South Pueblo, Colo., have consolidated their interests, and now carry on business in that place under the corporate name of the Colorado Machinery Company.

The Pensylvania Railroad Company has reduced the freight on coke 17 cents per ton.

The North Lebanon furnaces are to be remodeled by Messrs Witherow & Gordon, of Pittsburg, who will also put three Whitwell stoves into the Robesonia furnace, and two stoves for the furnace of Messrs. J. & R. Meily at Lebanon.

At Ansonia, Conn., the Farrel Foundry and Machine Company's orders for rolls are increasing to such an extent that a night force is soon to be added.

The Troy Bessemer Steel-Works recently produced in twelve hours 315 tons of steel in forty-one heats. This is considered the largest output on record with the number of vessels used.

The stockholders of the Union Iron and Steel Company, of Chicago, have decided to increase the capital stock from $1,600,000 to $3,000,000, the increase to be used for the purpose of effecting settlements with creditors.

President Potter, of the North Chicago Rolling-Mills, Chicago, states that the mills will again be in operation in three or six months, or not at all. They will not be started while the present prices continue. Four thousand men have been thrown out of work by the stoppage of these mills. Mr. Potter thinks that one third of the rails needed this year are already in market, and expresses the opinion that the outlook for the laborers now out of employment is a very dark one.

James Marshall & Co., iron pipe manufacturers, of Pittsburg, one of the largest firms in the business, have made an assignment to George J. Whitney for the benefit of creditors. The liabilities are $1,500,000, and the assets about $1,250,000. The failure was caused by too extensive speculation in pig-iron.

The Ferracute Machine Company of Brighton, N. Y., has issued a new catalogue of its power presses.

Messrs. E. P. Allis & Co., of the Reliance Works, Milwaukee, are building an engine for Carnegie Brothers, Pittsburg, Pa., for a pair of blowing-engines, with steam cylinder 36 inches diameter and 54-inch stroke, and air-cylinder 54 inches diameter and 54-inch stroke. They are to be put in for their new plant at the Edgar Thomson Steel-Works, these engines being similar in construction and design to those recently furnished the Joliet Steel Company, Joliet, Ill., by the Reliance Works.

The Chicago Smelting and Refining-Works are turning out large quantities of nickel-bronze castings for the Sperry Electric Motor and Car-Brake Company and the Hercules Iron-Works, of Chicago.

Fraser & Chalmers are building for the Golden Rule Mining Company, of Dragoon, Arizona, a complete twenty-stamp gold mill, including engine, boilers, and four Frue vanners. They are also making a thirty-stamp gold mill to go to Honduras. The above firm has just added to its boiler department a large boiler planer, which planes 14 feet 6 inches at each cut, and is 22 feet in length.

The Wharton Safety Railroad Switch Company, of Philadelphia, is gradually removing its works to Jenkintown, Pa., where the entire establishment is to be finally located. At the latter place, about 150 men are employed, while more

Digitized by Google

than 400 are employed in Philadelphia. It is said that the removal will effect a saving of 90 cents a ton in freight for the delivery of all material, and from $15,000 to $20,000 annually in taxes.

R. H. Brown & Co., Westville, Conn., are filling an order for the Mexican government for fixtures and tools for the manufacture of fire-arms. They have recently added to their tools several drills, milling-machines, etc., of the Pratt & Whitney Company's make.

A recent circular issued by the Akron Iron Company announces that the company has disposed of its coal and iron interests in the Hocking Valley to the Columbus & Hocking Coal and Iron Company of Columbus. The new management proposes to continue the Akron Furnace on the same grade of iron as in the past. Mr. S. E. Bliss, of 89 Lake street, Chicago, Ill., who has so long acted as the Akron Iron Company's agent for the sale of pig-iron, has been appointed agent for the new company, for the sale of Akron foundry iron, in the Northwest. The Akron Iron Company retains control of its rolling-mills at Akron, and Mr. Bliss will continue to act as its Western agent for the sale of the company's bar iron and patent hot polished shafting.

Robert W. Gardner, of Quincy, Ill., issues the following circular under date of March 29th: "I beg leave to announce that the business owned by me and known as the Gardner Governor-Works, has this day been incorporated under the laws of the State of Illinois, by the name and style of the Gardner Governor Company. This will effect no change in the management, which remains the same. The Gardner Governor Company will largely increase the present facilities for the production of the perfected Gardner governor, and has already commenced the construction of entirely new works."

GENERAL MINING NEWS.

ARIZONA.

A correspondent of the Tucson *Citizen*, in speaking of the Welshman and Copperosity mines, says: On the Welshman, the greater portion of the work has been done, a forty-foot shaft having been sunk perpendicularly. At 20 feet, a cross-cut has been run, exposing 12 feet of red oxide, carbonate, and copper-glance ore, and again at the bottom, a thirty-five-foot cross-cut toward the hanging-wall, it shows 23 feet of this same ore solid, with ore still in the face of the cross-cut and no signs of the wall yet. Assay shows from 21 to 75 per cent in copper. The ore is of a good character for smelting, the lode carrying a large amount of iron for fluxing. This mine shows an outcrop the entire length of both these claims, carrying the same ore. On the Copperosity, a body of ore has been uncovered in the surface, near the Welshman line; and farther on, a twenty-foot shaft has been sunk on the ledge, showing a solid body of ore. The owners of these two mines are pushing the development of their property. There is sufficient ore uncovered to justify the erection of a smelter of good capacity, with the best of self-fluxing ore and a perfectly level wagon-road from Casa Grande right to the mine, over which to haul coke and necessary supplies.

COCHISE COUNTY.

It is stated that capitalists from Silver City have bought a group of gold mines near Dragoon Summit, and will erect a twenty-stamp mill at once. The mill is expected to be ready to run in ninety days.

TOMBSTONE DISTRICT.

The Tombstone *Epitaph*, in its review, says that the bullion output remains about the same as at the last reports. The smelter for the San Diego mine is rapidly approaching completion, and in a short time will add its quota to the bullion production.

GRAND CENTRAL.—The pumps are working successfully. Sinking the shaft has been resumed, and the 900 level is to be reached before cross-cutting or drifting begins.

MORNING STAR.—The shaft, which has obtained a depth of 94 feet, is sunk on a ledge showing up a true fissure-vein, which is three feet wide at the bottom. The assays run high in silver and gold.

SYDNEY.—This mine, which is an extension of the Grand Central and Naumkeag mines, has at last started working. The shaft is at present in shale and porphyry, and from an inspection of the west drift from the bottom of the shaft, the near prospects of an ore-body are most encouraging.

ALIFORNIA.

INYO COUNTY.

IBEX.—The company is building a five-stamp mill. The mines have a favorable prospect.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended April 7th shows: Ore crushed, 157½ tons; average assay value of pulp, $28.91 per ton; of tailings, $4.54. East cross-cut, 1000 level, is in 361 feet. North drift, 800 level, is 353 feet long. North drift, 672 level, 62 feet long. Uprise No. 52 is up 53 feet.

STANDARD CONSOLIDATED.—The official report for the week ended April 7th shows: Ore extracted and shipped to mills, 1172 tons. East cross-cut, 1000 level, is in 1304 feet. South drift from east cross-cut, 700 level, is in 645 feet, and shows 3 feet of vein. The uprise from this drift is up 12 feet, and also shows 3 feet of vein. West cross-cut from north drift is 155 feet long, and is still in hard blasting rock. North drift No. 1, 500 level, is 633 feet long, and the vein is about 9 feet wide. North drift from north uprise No. 1 is in 136 feet, and shows 6 feet of vein. South drift No. 2, 385 level, is in 414 feet, where the vein is about 4 feet wide. Uprise No. 4 is up 155 feet, showing 5 feet of vein. Uprise No. 5 is up 89 feet, and north uprise is up 75 feet. North drift No. 3 is 40 feet long. The stopes are yielding as usual, and show no change.

PLUMAS COUNTY—GREENVILLE DISTRICT.

The *Bulletin* reports:

GENESEE.—The mill has started up, and has been running successfully.

GREEN MOUNTAIN.—The mills have been kept running steadily during the past two weeks, and have been well supplied with ore of fair quality. The tunnel is advancing rapidly, and will reach the ledge toward the end of the month.

INDIAN VALLEY.—This mine is said to be the only one in the district provided with steam-power. When the supply of water fails, the engines can be started up and work continued as usual both in mine and mill.

TAYLOR-PLUMAS.—The mill has been busy night and day since a start was made over three weeks ago. Most of the ore crushed has been taken from the dump. A shaft has been started to tap the ledge close to the mill. Work was, however, stopped on account of the storm. Drifting eastward from the winze in the tunnel is continued, so that, when work in the shaft shall be resumed and the ledge reached, there will not be any great delay in opening from the shaft to the winze drift. The ledge is opening out in this drift fully up to what had been expected.

CANADA.

PROVINCE OF NOVA SCOTIA.

GALLIHAR GOLD MINING AND MILLING COMPANY.—The result of the crushing of fifty-one tons of ore was a bar of gold of about 200 ounces. The superintendent states that the mine is in splendid condition, and that the ore in the 140 and the 250-feet lodes can be depended upon to produce at least four ounces per ton on an average.

HALL-ANDERSON.—Active preparations are in progress for an early resumption of work at this mine. A large force of men has been set to work taking out ore from the Serpent and Orion lodes both of which are looking unusually rich. There are about one hundred tons of ore on the dumps, which will be crushed as soon as the new plates and water apparatus are placed in position. The government road is now completed to within four miles of the mine, and it is expected that it will be entirely completed within the next sixty days. The outlook is said to be most encouraging for a dividend in the near future.

OXFORD.—One hundred and forty-two tons of ore were milled in April—the mill running only fourteen days—which yielded $46 per ton. The mine is improving.

COLORADO.

ARAPAHOE COUNTY.

GRANT SMELTING-WORKS.—The Denver *Tribune* gives the bullion shipments from these works for the past month, as follows: Last month's bullion shipments amounted in value to $545,050; this is the largest shipment ever made in one month by any smelter, mill, or other reduction-works in Colorado. The amount of ore treated was 8350 tons. The amount of bullion shipped during the month represents very closely the month's product. It was produced in eight stacks. The new ninth stack has been running for about a week, but did not affect last month's product. The average daily work of a stack is therefore the reduction of 33⅔ tons of ore. It is not likely that a much higher average than this could be reached. The average amount treated daily is 270 tons. The highest amount treated in one day during the month was 307 tons, or 38⅜ tons to the stack. That is a fair test of the actual capacity of the stacks, with the charges then used, as they were running under a blast pressure which caused the slag to spout from the tap-hole in a stream which fell clear of the gutter which usually conducts it to the slag-pots. The new stack is similar to the others, and consequently, with similar ore and a smooth run, there will be probably over 9000 tons treated during the present month, and over $600,000 of bullion produced.

CHAFFEE COUNTY.

LONGFELLOW.—This claim, situated near Salida, has been opened in a new place, and the result is the securing of a large body of carbonates of a high grade.

MERRIMAC.—This company will put up concentrating-works just below Garfield, on the creek, where excellent, lasting, and abundant water-power can be had. Building will begin within the next ninety days.

CLEAR CREEK COUNTY.

GARFIELD.—This company, which was incorporated recently, will commence operations in May. The company owns four lodes, namely, the Excelsior, Aurora, Grand View, and Arequipa. The Excelsior lode will be cut at a depth of 250 feet; the Aurora, 690; and the Grand View 980.

FREMONT COUNTY.

The company that has been boring for oil at Cañon City struck it at a depth of 1200 feet. The oil is of a superior quality. The find is of course nothing more than a prospect at present, but experienced prospectors are sanguine in the belief that a few more days will develop an immense deposit.

ROYAL GEORGE SMELTING COMPANY.—A dispatch to the Denver *Tribune* states that one of the furnaces was blown in April 7th. The second one will be put in operation shortly. The capacity is fifty tons per day each.

Digitized by Google

GILPIN COUNTY.

A dispatch from Central City says that there is considerable excitement over additional discoveries of surprisingly rich silver ore in Sulphuret Mountain, the new mining district.

DUTCHMAN.—The main shaft has attained a depth of 215 feet, from which point levels east and west will be driven. The outlook of the mine is favorable. At a point 160 feet below the surface, drifts east and west have been driven 40 feet in length.

GUNNELL.—The products of this mine for March were as follows: Smelting ore sold, $7780.75; gold retorts, $2323.75; tailings sold, $256.26; total, $10,330.76.

QUARTZ HILL MINING AND TUNNELING COMPANY.—It was decided at the annual meeting, held in Central City, to levy an assessment, so as to continue work in the heading of the tunnel, and a contract will soon be let to run the tunnel twenty-five feet beyond its present heading.

LEAVITT.—Work is to be resumed at this property. Men are engaged cleaning out the shaft.

TORONTO.—The mine produced and shipped about forty tons of ore during the month of March, which netted on an average about $18 per ton. The crevice is over two feet in width, all of which is sent to the sampling-works without sorting. It is soft and very easily worked. The ore now shipped is from a drift 25 feet from the surface.

LAKE COUNTY.

Late Leadville exchanges contain the following:

CLIMAX.—In the No. 3 shaft, which has reached a depth of two hundred and fourteen feet, a strike was made recently. The lessees have been pushing work vigorously, and after running a drift sixty feet from the one hundred and thirty-foot level, they came upon a three-foot breast of ore which carries one hundred and sixty ounces in silver and seventy-three per cent in lead. The ore is regarded as being of the most valuable character from the fact that it costs but a small amount to reduce it. About five tons per day are shipped, and this amount will be increased gradually as the work progresses.

COLONEL SELLERS.—The shaft has attained a depth of one hundred and six feet, and has passed through a small body of lime carbonates. After sinking twenty feet farther, the lessees will proceed to drift.

MATCHLESS.—The latest and what is considered the most important strike lately made is that in shaft No. 3. This shaft, after cutting a body of flint ninety-six feet in thickness has, at a depth of about two hundred feet, cut a large body of sand carbonate, assays from which return about thirty ounces in silver per ton. A short drift has been run on this body, and is entirely in ore,

MORNING STAR.—The McCord shaft is now down 300 feet, and is sinking to connect with the incline below the Waterloo shaft. A body of mineral was cut at 200 feet. A vein of water has been struck in the lower Waterloo shaft, but no great trouble is anticipated.

PITKIN COUNTY.

GENERAL SHIELDS.—Recently a vein has been struck, three feet in width, which carries ore that averages from thirty-five to forty ounces in silver, and fifty-five per cent lead. The owners have been working constantly, and there are about three thousand tons of ore upon the dump at the present writing.

SUMMIT COUNTY.

ADDIE.—The new incline is in forty-five feet, and is already showing some mineral. It is thought that the ore-body will be reached at a distance of seventy-five feet.

FELICIA GRACE.—The vein recently struck is about five feet thick, and contains wire silver and galena. The ore is in lime, and the appearances are, that the formation is regular. The vein is nearly perpendicular, and has the appearance of a fissure. No shipments have yet been made.

MAXIMUS AND BERNADOTTE.—The Leadville *Democrat* prints the following: There has been considerable gossip recently about a rich strike in one of the mines owned by the Colorado Land and Mining Company, located on Fletcher Mountain in Summit County, and about a true fissure-vein that had widened to five or six feet, and was already producing large quantities of high-grade ore. The reports being conflicting, the reporter called at the office of the company yesterday, and interviewed the manager, who was very evasive, and said in emphatic terms that the property of the company was not worked for the benefit of the public. The reporter learned from another source that the Maximus and Bernadotte veins were beyond question true fissures, and that they had produced more high-grade ore during the past month than at any previous month since the mines were opened. All persons not interested have been excluded from the mines, and it is difficult to get at their contents. A true-fissure producing vein is of vital importance to that district, and whatever tends to promote the welfare of the State is of interest to the public. This suggestion is for the benefit of the reluctant manager.

ROBINSON.—The new incline from winze No. 2 shows a vein of solid pay mineral five feet thick.

DAKOTA.

CALEDONIA.—The superintendent reports for the week ended April 1st: Ore produced, 1025 tons. Winze advanced 9½ feet; total, 66½ feet. We resumed work on the south header, which is now 59 feet from the chamber. There is a marked improvement in the yield of ore for the last ten days. For the week ended April 8th: Ore produced, 1050 tons. Shipped 827 ounces gold; value, about $14,000. Winze advanced 10 feet; total, 76½ feet; all in very fair ore. Work on the south header is advancing slowly, but all the ore taken out is of good quality.

FATHER DE SMET.—The superintendent's report from April 1st to April 8th shows ore extracted from first, second, and third levels, 1975 tons. Ore milled, 1975 tons. North end tunnel in 864 feet. Golden Gate north header in 60 feet. Cook's west cross cut in 39 feet. Tramway level rise in 51 feet. The superintendent writes, under date of the 5th inst., as follows: Herewith express company's receipt for bar No. 156, 1038·85 ounces gold, the result of run of mill for last half of March. The mill is running with the regularity of clock-work, and unless some accident occurs, it will require less repairs the coming year than for either of the last two past. At the mine, every thing is running well. The cross-cut running west from Cook's chamber is penetrating a good body of ore. We are into it with cross-cut for a distance of 15 feet; and if it continues to foot-wall, it ought to be, and I think it will, be 65 feet wide. I have reduced the force by discharging ten miners. If the dividend was about ten cents per share per month, I think I could tell you that we have twenty dividends in sight; and should also be able to do more necessary development-work, so that, at the end of the twenty months, we should have twenty more dividends in sight.

HOMESTAKE.—It is believed that this company will erect a 200-stamp mill on the Old Abe this season, although its location has not yet been determined. Whitewood, at the mouth of Gold Run, will probably be selected, as an abundance of water would there be assured, even in the dryest season.

RICHMOND.—A strike is reported in this mine, lying east of the Sitting Bull. The opinion prevails that the ledge, if there be one, is the Sitting Bull caught on the dip. Later reports say that litigation of an interesting character is promised between these companies.

SITTING BULL.—The mill continues in successful operation, turning out about 900 ounces every twenty-four hours. A large force is at work upon the addition, which will be completed in about two weeks, and which will treble the present milling capacity of 18 tons a day. Nearly all of the machinery has arrived. The dump now contains eighteen months' supply of milling ore, while a large reserve is in sight in the mine.

GEORGIA.

COLUMBIA.—The work is progressing rapidly; but on account of rain and lack of carpenters, the flume will not be completed as soon as expected. The tunnel through which the flume passes, in going through a divide so as to get to a great depth on the ore, is over 300 feet long.

FINDLEY.—Work is to be resumed at this mine, which has been shut down for a long time.

LOCKHART.—The twenty-stamp water-power mill is not at work. The ore is mined from the seven-foot vein on Findley Ridge. The vein is very uniform and turns out well.

PIGEON ROOST.—The mill has shut down. The owners will increase the present capacity to twenty stamps.

MEXICO.

Quimby, Appleton & Co., owners of the Zamelebuacan mines in Vera Cruz, have been joined by several capitalists from St. Louis, and will enlarge the operations at the mines. The Mexican *Financier* says that these mines are situated some ten miles from the Maqueta mines, and like the latter are conducted on the American system of mining. They are about 12 miles from Perote. The ores bear gold, silver, and copper. The silver ledges are generally narrow, but the supply of gold and copper-bearing ores is large, the gold ores running from $7.50 to $30 per ton. The mines have been worked for more than two hundred years by running tunnels into the mountain. One of these, on the Alto mine, is about 800 feet long. The ores are run through a Blake crusher, and are then worked in a Tasker pulverizer, and run over two Embrey concentrating-tables. The company will now erect a pulverizer of twice this capacity. The power is derived from an adjoining stream. The company will also erect a water-jacket furnace for smelting the copper ores which are now treated in a small Spanish smelter.

PACHUCA DISTRICT.

A correspondent sends us the following notes from the Pachuca and other districts in the State of Hidalgo:

Work on the "Pachuca River Concentration" advances slowly. The engine-house, with foundation for engine and boiler, is nearly completed. A part of the machinery has been received; the remainder, which is still at Irobo, is expected shortly.

At Real del Monte, work is to be resumed in the mines of Gen. John B. Frisbie, of California, who has some good property there. It is to be regretted that they have been left idle so long.

El Rosario mine, at El Chico, worked principally by American capital, is doing well. The old shaft, which is reported to be down several hundred feet, is now unwatering; in one of the old workings, a branch, one foot broad, of rich ore has been found. The mine promises well.

In the Capula and Santa Rosa districts, work has been stopped on nearly all the mines of the Schley Mining and Milling Company, until some arrangement can be made about putting up a mill for reducing the ore of the district.

The Miners and Inventors' Company, of Boston, has stopped work on all the mines for the present. Some of its property is reported to be good.

The Cueva Santa is looking well and is worked.

NEVADA.

COMSTOCK LODE.

From the report of the investigating committee of the San Francisco Stock and Exchange Board, we take the following:

We have found it impossible to obtain any reliable official information with reference to the condition of the mines on the Comstock lode, and the little we have been able to glean from that source is any thing but satisfactory. This is owing to the secrecy with which all exploratory work is carried on. While the State laws have made it imperative, on the part of the superintendents, to report to the companies' officers all discoveries made with the diamond drill, it is found that they have, in almost every instance, disregarded the law, contenting themselves with privately reporting such discoveries to operators who have obtained such control, while having little if any moneyed interest in the companies. This is a matter of grave import to the stockholders of the companies, who, while paying enormous sums for the purposes of exploration, are debarred all knowledge of or benefit from any discoveries which may be the result of such expenditures. It is true that reports are made to the secretaries of the different companies; but they are very meager and treat only of the most unimportant work going on in the mines; and where reference is made to interesting points on the lode, the information given is so vague as to be rather calculated to deceive than to give any proper understanding of the situation. From information obtained outside of official sources regarding the existence of "concealed bonanzas," we are inclined to the belief that valuable ore-bodies have been discovered, which, so far, have not been officially announced.

With reference to the middle and north-end mines, namely, all those mines situated between Potosi and Utah inclusive, we have to say that they appear to be in a splendid condition for rapid exploration. There has been an enormous amount of money expended upon these mines in preparatory work, such as sinking shafts and winzes, and making air-connections, running lateral drifts, etc., and we have every reason to suppose that the cost of future explorations in these properties will be much less than at any time in the past. In fact, it should be possible to run these mines for the next two years for one third of the expense which the work for the past two years has entailed on the stockholders. These mines are thoroughly ventilated, and, as a rule, much cooler than they have been for some time past. The danger from water is past, the water problem having been solved, and the work now going on is below the water-belt, and the mines are well drained. Nothing but the grossest carelessness could cause any damage from water. These mines are splendidly equipped with machinery of the finest and most substantial character, their pumping machinery being unequaled in the world. The mines are opened to great depth, the deepest workings being in the Mexican and Ophir, on the 3100-foot level. They have large and substantial shafts and winzes, and are opened laterally with large drifts for about two miles, and so well arranged and connected as to make danger from fire a very remote contingency.

For about a mile north of Savage, no explorations of any importance have been made on the lower levels until very recently, when several cross-cuts were started, one of which encountered ore on the line of the Union Consolidated and Sierra Nevada of great promise, and we have good reason to hope that when further explored it will prove a real bonanza. The other cross-cuts so far give good indications, and we expect to see paying ore developed by them.

The Savage, Hale & Norcross, Chollar, and Potosi are ready for cross-cutting on the lower levels, and the fact that in Hale & Norcross there has already been some good ore discovered in the 2600-foot level gives reason to expect the uncovering of a body of good ore in this section of the lode.

In the Mexican, Ophir, California, Consolidated Virginia, Best & Belcher, and Gould & Curry mines, there is a block of ground about 1000 feet in hight by over 1000 feet in width, and over 3500 feet in length, which has not, so far as has been learned, been cross-cut or explored in any way to any great extent.

All the lower levels of the Comstock mines are in an ore zone, as shown by the continual cutting of stringers, seams, and small bodies of rich ore, and there is no reason why there should not be large and rich bodies of ore discovered. In

Digitized by Google

fact, the prospects for the lode were never brighter. So far as the southern group of mines is concerned, nothing can now be seen below the 1900 level, as the mines have been flooded up to that point for more than a year. Above this level, there has been a large amount of ore extracted. Within the past two years, over 120,000 tons of ore have been extracted and worked—principally from the Crown Point and Belcher. There is an abundance of ore in these mines, and it is not the fault of the mines that they have not been placed on a paying basis long ago. The prospects and condition of the mines on the Comstock lode has not been so good for years.

NEW MEXICO.

A correspondent of the New York *World* says that sixteen miles west of Las Cruces (an old Mexican town on the Atchison, Topeka & Santa Fé Railroad on the Rio Grande) is situated the Organ Mountain Mining District. About one and a half miles south of Organ, is the Stephenson mine, worked by Horace Stephenson before the war. All the mining was done by Mexicans on the "coyote" plan, the ore being packed on burros to the Rio Grande, and smelted in adobe furnaces. The Stephenson mine changed hands many times; finally a company which is at present known as the San Augustine Silver Mining Company was formed to work the mine. It is hoped that work may soon be commenced, as the mine shows a very large body of tractable ore. It is a lime and porphyry, and the ore runs about $35 to the ton in silver clear across the lead.

At the town of Organ, about one hundred yards north of the road, is the Memphis mine, situated on a low foot-hill about one and a half miles west of the main range. The main shaft is down 155 feet. At the 100-foot level, a drift has been opened 105 feet, showing a vein of ore 9 feet, red and black oxide of copper running from 27 to 60 per cent, and silver running from 5 to 100 ounces. At the same level, are also two winzes of 18 feet in depth each, down to water-level, and also showing 9 feet of ore. At 150 feet, a cross-cut was made, finding ore 17 feet from shaft, ore opening at five feet. Three assays gave the very satisfactory return of $40 per ton, the ore consisting of black oxide of copper, containing antimony. Machinery is daily expected. The mine is bonded for six months, and work will be pushed vigorously.

About two miles north, in the main range, are the Merrimac, Little Buck, and Silver Star mines. The Merrimac is the most fully developed, and has two lodes running through it, known as the Merrimac lode and the Little Buck lode. The first opened was the Merrimac, seventy feet, on an incline of forty-five degrees. The vein is from four to five feet in width; hanging-wall, porphyry; foot-wall, lime. The ore shows pyrites, green carbonate, and peacock copper, averaging 15 per cent; also galena, of which assays have been made running from 66 to 176 ounces.

About 100 feet to the east of the first shaft, the Little Buck lode has been opened twenty-five feet at an angle of forty-five degrees and dipping toward the Merrimac lead. One chamber has been opened and stoped and ore of the highest grade taken out, sacked and shipped to the St. Louis Smelting and Refining Works.

Adjoining the Merimac on the northeast is the Little Buck mine, a lime contact, native and horn-silver having been found two feet from the surface in June, 1882. Work is progressing slowly.

On the same lead, and adjoining the Little Buck on the northeast, is the Silver Star mine. The vein shows the same characteristics, but not so much native or horn-silver has been found. The lead is now decided, and shows galena principally; small quantities of native silver have also been found.

West of the Merrimac, on a foot-hill at the base of the mountains, is the Jay Gould, down 50 feet in a copper blow-out. Four fifths have been lately purchased by Philadelphia parties for $10,000. Work will soon be resumed.

Crossing the range at San Augustine Pass and going north two and a half miles, is the Black Prince group of mines, on the eastern slope of the mountains, which are very narrow for ten miles north of the pass, a rincon breaking back from the eastern face of the range. The Black Prince group consists of the Black Prince, Hidden Treasure, and the Fourth of July mines. The veins run from the southwest to the northeast. The formation is limestone, quartzite, and slate. The Black Prince is down 50 feet in lead carbonates, running from 13 to 51½ per cent lead, and from 34 to 54 ounces silver. From indications, the carbonate bed is from 10 to 25 feet wide. The Hidden Treasure is a tunnel excavation of 200 feet; hanging-wall, slate; ore, lead carbonates, same as Black Prince. The Fourth of July mine has a four-foot ledge showing silver and galena. The group is considered one of the best prospects in the Organs, but needs development.

Two and a half miles east of the Black Prince and four miles north of Shedd's Ranch, on Mineral Hill, a mountain detached from the main range and about in the middle of the rincon, is a group of mines, the most prominent of which is the Lady Hopkins, upon which work was commenced in January, 1882. The mine is now 105 feet in depth, with a good prospect, the ore running low in gold, silver, and copper. At 300 feet, work will be begun again on the shaft, so as to strike the tunnel. Two shifts are steadily at work.

Two miles northeasterly of the Hopkins is the Iron King group—the Iron King, Mary C., and Little Gem. The Iron King was opened to a depth of 79 feet in the summer of 1882; is an iron-stained quartz, the vein dipping at an angle of 45 degrees to a depth of 40 feet, then straightening to 20 degrees. The ore shows copper, silver, and gold in iron and quartz, and assays $30 per ton at a depth of 30 feet. The formation is granite and porphyry; width of vein unknown. Work was resumed February 1st by the owners. At 100 feet they will cross-cut for the walls. Southwest of the Iron King, and adjoining it, is the Mary C. mine. Assessment-work only has been done so far.

Four miles north is Black Mountain, on which are situated the Mountain Chief and Copper Duke mines. Work has progressed steadily, the formation changing very often, but the body of ore gradually growing larger. The ore runs principally in silver; at times the shaft runs in copper pockets. At present, at 115 feet, they are in an iron-stained quartz similar to that in which the strike was made.

Farther along the mountain, work is pushed by a Fort Worth company. Fifty-foot shafts are sinking in six claims, the most promising of which are the Dean Richmond and Home, Sweet Home.

North of Black Mountain, on the eastern face of the range, is one of the strongest leads of the camp. The course of the vein is from the southwest to the northeast. There are three adjoining claims—the Broad Gauge, the Alb, and the Fertile. Assessment-work only has been done on the first two. The Fertile is down 55 feet, the ore running from 15 to 55 per cent copper and 22 ounces silver. The vein was 2 feet wide in surface, but opened out to 7 feet at 35 feet.

All along the mountains, work is progressing steadily. The principal work is now going on on the east side. Good prospects are scattered all along from the pass to the San Andreas. The locations are on Mineral Hill, Antelope Hill, Black Mountain, Bear Cañon, and at Little San Nicholas, where the Organ Mountains and the San Andreas commence.

The survey of the El Paso and White Oaks Railroad has commenced, and has already progressed about twenty miles north of El Paso, finding a very easy grade and a country requiring the least amount of labor for the construction of a road-bed. The mining locality above described can not fail to attract wide attention as soon as transportation for ore is thus secured, which will be followed by the development of the fuel deposits and the erection of smelters along the line of the railroad in close proximity to the mines.

NEW YORK.

According to Mr. James M. Swank's report to the American Iron and Steel Association, the production of iron ore in 1882 of the Lake Champlain District of New York is estimated by a very well-informed correspondent at 675,000 gross tons, against 637,000 tons in 1881. Included in this district are the Chateaugay mines, from which 224,158 tons were shipped in 1882, according to the information received from Mr. A. L. Inman, general manager of the Chateaugay Ore and Iron Company.

PENNSYLVANIA.

Mr. J. Taylor Boyd, general superintendent of the mines of the Cornwall Ore Bank Company, in Lebanon County, states that the shipments of iron ore from these mines in 1882 amounted to 309,680 gross tons, against 249,040 tons in 1881.

UTAH.

CRESCENT.—The Salt Lake *Tribune* states that there are exposed in the workings of this company's claims 40,000 tons of ore of an average value of $38 per ton and which will net $20 per ton, the cost of mining, hauling, and reducing not being more than $18. It is further stated that the mine is in shape to send out from 75 to 100 tons per day as soon as it can be hauled away on the roads, which are at present in a very bad condition.

EMMA.—In order to be able to operate the mine at a much lower depth than the old workings, the present management has secured the right of way through the Bay City tunnel, which is in nearly half a mile. At the heading of this tunnel, a shaft is sinking, which has reached a depth of 155 feet. At a depth of 135 feet, a good station has been cut, from which drifting for the vein is done. This has now reached a length of twenty feet, and progress is made at the rate of three feet per day. It is expected to tap the Emma body of ore in 100 feet from the point now reached. The cuts making are in country-rock, which is barren of all mineral indications. The expenditures for machinery by the company during the past year aggregate about $20,000, and every improvement made is of the most substantial kind.

MAMMOTH.—The difficulties regarding this property have not yet been settled, according to the latest reports of the Salt Lake *Tribune*.

MILLARD COUNTY.

DESERET.—Mr. E. P. Hall, Secretary, reports the following: Recent test shipments made from the E. P. H. lode, one of the properties of this company, show most satisfactory results, extremely gratifying to the owners, and encouraging to all interested in this Detroit District. A shipment of ten tons average ore, taken out in sinking the shafts from a depth of 130 to 138 feet, sent to the sampling-works of Messrs. Scott & Anderson, Sandy, Utah, gave an average run of 15·4 per cent of copper and $15.27 in gold and silver. One car-load sent to the Chicago Copper Company yielded 25·3 per cent of copper. Eight tons being oxide ore, taken out of drift run from the 140-foot level, gave 19·7 per cent; and 3½ tons of green carbonate from the cross-cut tunnel at the 155-foot level ran 38·6 per cent of copper. The face of the drift from the 140-foot level is in ore, and is improving as greater depth is attained, pitching into the mountains. At the bottom of the shaft, the ore-body grows stronger. The cross-cut at the 155-foot level shows the largest ore-body yet discovered. Following this vein over the mountain for some 2000 feet, prospect shafts have been sunk various depths to 18 feet, all showing free gold quartz, assaying from $15 to $45, with picked samples showing from $215 to $490, in gold.

SILVER REEF.

STORMONT.—From a statement giving the present condition of the workings and developments of this property, we take the following: The Buckeye, Last Chance, and Half Savage, situated in one block of ground, are the only claims now worked by the company. The mines have been developed by five levels and a number of shafts. The present yield is about 1000 tons of ore per month, at a cost of $8 per ton for mining, $3.50 per ton for milling, and $2.08 for hauling. Prospecting costs about $1000 per month. At present, there are about 3000 tons of ore in sight, of from $20 to $25 per ton value. The company's mill is located on the Virgin River, six miles from the mines. The plant consists of ten stamps, 650 pounds weight, thirteen pans of 3000 pounds capacity, seventeen settlers, two boilers, twelve and fifteen feet long, pumps, retorts, etc. Power is furnished by a forty-eight inch turbine-wheel. The mill and the improvements cost over $70,000. After the failure of Clark & Bothwell, the most conservative course was forced on the present management of this property. Outside of the complications arising from the failure, other great difficulties were met. A series of freshets damaged the dam on the Rio Virgin, and swept away the mill-race, during the months of July and September, 1882, entailing great loss. During the months of November, December, 1882, and January and part of February, 1883, the ore ran very low grade, often as low as $15 per ton. To meet all these unexpected expenses and discouragements, required the strictest economy. With this end in view, the company has succeeded in reducing the monthly expenses from $22,000 to $15,000. Since the middle of February, the ore has steadily improved, until at present it averages about $23 per ton. As the ore on the upper levels has averaged as high as $35 per ton, it is expected that ore of that grade will be reached again. During February, rich ore was struck on the old Stormont vein just north of the boundary of the Stormont claim, on property not belonging to this company. This strike is believed to continue into the company's property, and to assure an additional ore-supply from a claim which has been worked for years. The present condition of the affairs of the company, in view of the difficulties which it has had to contend with, must be considered satisfactory. The gross bullion produced from May 16th, 1882, to March 1st, 1883, amounted to $188,718. Product of gross bullion for March, $19,770. None of the workings is as deep as some of those of other properties at the Reef, which to-day, on the same vein, are extracting much better grade ore. The two claims, the Thompson and the McNally, have never been developed. These claims are on the same reef as the Barbee & Walker mine, which at one time produced largely. The Stormont claim proper has not been worked for some years. Recent developments on adjoining property, above alluded to, indicate that valuable ore will again be found on it. At present, the mill and all its appurtenances, dam and race-way, are in the most stable condition, and there is no fear from further trouble by freshets.

WYOMING.

A correspondent of the Salt Lake *Tribune* writes from Atlantic City that mine-owners who have not worked the past winter are preparing to push work. The owners of the Soles & Perkins have been quietly at work all winter, and have a three-foot vein of ore that will run on an average $12 per ton. They own, in connection with the mine, a good ten-stamp mill and water-power. The Mary Ellen, which in days past attained considerable notoriety, having high-grade ore, is also owned by the owners of the above mine. The vein is small, but of extreme richness, and has yielded largely.

The Buckeye has been worked with good results. The ore averages about $8 per ton.

The Cariboo has also been worked the better part of the winter, and shows a small vein of good ore.

The Carrissa, in South Pass District, has had only assesment-work done.

The Bullion mine, in Miner's Delight District, has for some time past remained idle, owing to the vast amount of snow accumulated during the severe storms of February, and the absence of water for milling purposes.

A few prospects on Strawberry are worked, and it is said with flattering results.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, April 20.

There is nothing new or of special interest to note in the mining market this week. The dealings continue to be almost exclusively confined to Sonora and Robinson and a few low-priced stocks. Sonora and Robinson have been manipulated to suit the market, and have been strong one day and weak the next, while the others have generally showed weakness. Alta-Montana has come in for an active share of the business, and has been very weak, selling as low as 4c. Navajo, the chief Tuscarora stock, has also been very weak, but closed to-day a little stronger. Below will be found a complete summary of the market. The total number of mining shares sold at all the Exchanges aggregates 262,326, as against 344,094 last week.

The Comstock shares have been quiet and steady. California records but a small business at steady prices, selling from 22@20c. Consolidated Virginia was quiet and steady, selling from 48@45c. Sierra Nevada was dealt in to the extent of 465 shares at $2.10@$2.25@$2. Union Consolidated records but one transaction, and that at $3.25. Mexican was quiet and steady; it sold from $2.88@$2.75. Ophir sold at $2, and Savage at $2. Yellow Jacket was dealt in to-day at $2.88@$2.75. Best & Belcher sold to the extent of 300 shares at $3.50@$3.38. Sutro Tunnel was active and steady, selling from 21@20c.

The Leadville stocks were also quiet, and were steady. Amie was the exception, and was active at irregular prices, selling from 22@18@20c. Chrysolite records but a small business, and was steady at $1.20@$1.15. Dunkin sold at 26@25c., and Hibernia at 2c. Iron-Silver had a small business at irregular prices, selling from $2.90@$2.80@$2.85. Leadville was dealt in to the extent of 400 shares at 69@68c. Little Chief sold at 45@43c., with a small business. Little Pittsburg was steady at 60@66c., with a business of 600 shares. Big Pittsburg sold at 20c., and Climax at 6@5c. Miner Boy, with one small transaction, sold at 1c.

The Bodie stocks were quiet and steady. Bodie Consolidated was quiet and a little weak, selling from $1.50@1.25. Standard had a fair business, and was strong; it sold from $6.88@$7. Bulwer sold at 85c, and Goodshaw at 2@1c.

The Tuscarora stocks record a small business, and were generally, steady with the exception of Navajo. Grand Prize sold at 95c., Argenta at 85c., and Belle Isle at 50c., each recording but one transaction. Navajo had a fair business, and was quite weak; it sold from $3.20@$2.10@$2.40. North Belle Isle sold at 31c. Independence records a fair business at steady prices, selling from 65@60c. Elko Consolidated was active and irregular; it sold from 6@10@8c., with a business of 14,900 shares.

In the miscellaneous list, Alice continues strong, selling from $2.80@$3 with a small business. Bassick sold from $9.50@$9.63. The Green Mountain stocks have been quiet and steady. Gold Stripe sold at 7@10@9c. Green Mountain sold from 80@82c., and Cherokee at 2c. Hall-Anderson was active, and has grown quite weak; it sold from $2@$1.35, the transactions aggregating 10,800 shares. Homestake was quiet and steady at $15½@$15⅝. Horn-Silver had a small business and was a little weak; it sold from $8@$7.50. Ontario had a fair business at stronger prices, selling from $26½@$27¼. Robinson Consolidated continues to be actively dealt in at very irregular prices; it sold from 84@75c., then up to 84@79c., closing at 83c. to-day. Sierra Grande records but a small business, and has been steady; it sold from $1.65@$1.75. Vizina has been moderately dealt in, and has been a little weak, selling from 85@81c.

Alta-Montana, has been actively dealt in, and has become quite weak; it sold from 9@4@5c. Central Arizona was quiet at 29c. Dahlonega sold at 3@4c., with a small business. Decatur has been active and irregular, selling from 5@2@4c., the business aggregating 21,400 shares. Durango records but one transaction at 5c. Eastern Oregon sold at 40c. Harlem was moderately dealt in at irregular prices; it sold from $1.40@$1.55@$1.45. Hortense sold at 10@12c. and Lacrosse at 11@12c. Oriental & Miller has had a fair business at steady prices, selling from 17@15c. Rappahannock was quiet and steady at 9@8c. Red Elephant sold at 7c., the transactions being small. Silver Cliff sold at 34@33c., with a small business. Sonora Consolidated has been very active at very irregular prices; it sold from $1.30@$1@1.55@$1.05, closing at the latter figure to-day. South Pacific sold at 6@5c., with a small business. The State Line stocks were quiet and steady; Nos. 1 and 4 sold at 2@8c., and Nos. 2 and 3 at 6@5c. Taylor-Plumas has grown stronger, under a large business, and has sold from 14@19c.

The Reliance Mining Company has been dissolved by order of Judge Barrett, of the Supreme Court, and Mr. Charles H. Hamilton appointed receiver. The company was organized some years ago, and the petition for its dissolution states that it is possessed of no property.

MEETINGS.

The Atlanta Hill Mining Company. Mills Building, fifth floor, Room 4, New York City. Annual meeting and election of trustees May 2d, from two to three o'clock P.M.

The Evening Star Mining Company, No. 2 Wall street, New York City. Annual meeting of stockholders and election of trustees, May 7th, from two to three o'clock P.M.

The Little Pittsburg Consolidated Mining Company No. 45 William street, New York City. Annual meeting of stockholders and election of trustees, May 7th, from two to three o'clock P.M.

The Morning Star Mining Company, No. 2 Wall street, New York City. Annual meeting of stockholders and election of trustees, May 7th, from two to three o'clock P.M.

The Sterling Mining Company, No. 2 Wall street, New York City. Annual meeting of stockholders and election of trustees, May 7th, from two to three o'clock P.M.

DIVIDENDS.

The Carbonate Hill Mining Company, of Colorado, has declared dividend No. 4 of five cents per share, payable May 2d, making the total dividends to date $40,000.

The Contention Consolidated Mining Company, of Arizona, has declared its regular monthly dividend (No. 15) of twenty-five cents per share, payable April 28th, at the office of the Farmers' Loan and Trust Company on all stock registered in New York.

The Diamond Coal Land Company announces a quarterly dividend of three per cent, payable on demand.

The Father de Smet Consolidated Gold Mining Company, of Dakota, has declared dividend No. 27, of twenty cents per share, payable at the office of Laidlaw & Co., No. 14 Wall street, New York, April 30th. Transfer-books will close April 23d.

The Kentuck Mining Company, of Nevada, has declared a dividend of ten cents per share.

The Mohave Mining and Milling Company has declared a dividend (No. 4) of two per cent on the par value of the stock, payable at the office of the company, No. 78 La Salle street, Chicago, April 25th.

The Shoshone Gold Mining Company, of Idaho, has declared a dividend (No. 5) of one per cent on the capital stock, payable April 18th.

The Silver Cord Mining Company, of Colorado, has declared a dividend (No. 1) of fifteen cents per share, and an extra dividend of five cents per share, payable May 2d.

The True Fissure Mining Company has declared a quarterly dividend of twenty-five cents per share, payable on demand, at the office of the company, No. 167 La Salle street, Chicago.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, No. 49 Broadway, report as follows for the week:

Fluctuations during this week have been small and inconsequential, ranging from 92@96c. It is exceedingly dull in the oil market.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

		Opening.	Highest.	Lowest.	Closing.	Sales.
April	14....	$0.94⅞	$0.95	$0.93¼	$0.93⅞	392,000
	16....	.92¾	.95⅛	.93	.95⅛	644,000
	17.....	.95¼	.95¾	.93⅛	.93¾	593,000
	18.....	.93⅞	.95⅛	.93⅝	.93⅝	578,000
	19....	.93⅝	.95	.93⅝	.93¾	439,000
	20.....	.94	.94⅛	.93⅞	.93⅞	251,000
	Total sales.					2,897,000

The Cooper tract, that was producing 5000 barrels a week ago, is now yielding 3300 barrels, and the Balltown District only 810 barrels, as against 1000 barrels two days ago. There are several wells expected in within the next few days, and better prices are looked for soon.

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market continues dull. The Comstock shares show but little change in prices, and the business has been light. The outside stocks have also been dull. The only change of interest to note is in the Tuscaroras, which have been quite weak, the sharp decline in Navajo affecting the whole list.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, April 19.

There is no improvement to note in the market for copper stocks the past week. The market is fairly steady as to prices, but business is extremely dull, and there is no disposition to buy any thing, except the dividend-paying stocks, which at the present rates for ingot copper will reduce the number of this class to probably two mines, namely, Calumet & Hecla and Quincy. The former will no doubt continue to pay its regular dividends, as it can make money at even a much lower price for copper, and the latter will be able to pay, although not so much as in the past two years. The Osceola, which has paid regular dividends for some years past, seems to be declining in price, which would indicate a fear on the part of holders that it may suspend dividends during the coming year, unless there should be an advance in ingot. Calumet & Hecla sold this week, ex dividend $5, at $234, and later at $234½, which is equal to $239½, the closing price of last week. Quincy has been fairly steady, at the decline of last week, selling at $45¾@$46. There have been no sales of Pewabic the past week; in fact, there is no demand for it; we hear that $3 is offered for it, assessment paid, which would not leave much for the holder. Franklin declined from $11@$10¼ on sales of 50 shares only. At the annual meeting this week, the old board of directors was re-elected, and the same management will continue the coming year. Osceola declined from $26½@$24 on free offering of the stock. Huron sold at 50c., assessment unpaid. National, no sales, but an assessment of $1 is announced, as indicated last week. Copper Falls sold at $1, as before.

In silver stocks, Catalpa declined from 72½@57½c.; but later rallied, and sold to-day at 65c., which is bid. Crescent sold at 25c. Harshaw, at 50c. San Pedro, at 62½c. Sullivan, at $1.

At the Boston Mining Exchange, the principal feature was the announcement of an assessment of 10c. per share on Bowman Silver Company, recently listed, and which was considered a good property and entitled to confidence. The price at once declined from 11 12@7c., and many of the members consider it a case of rather sharp practice. Empire was

Digitized by Google

dull, but quite firm at 18@19c. Massachusetts & New Mexico, rather firmer at 8@9c. Brunswick Ship's Berth sold at 60@70c.

3 P.M.—There was but little doing at the afternoon Board. Calumet & Hecla sold at $233. Osceola declined from $24@$23. Sullivan sold at $1⅛.

Closing prices: Allouez, $1⅞ bid, $2 asked. Atlantic, $11. Bonanza, $2 bid. Calumet & Hecla, $233@$235. Catalpa, 65@70c. Crescent, 22½@25c. Franklin, $10¼ bid. Quincy, $46 asked. Sullivan, $1⅛ bid, $1¼ asked. San Pedro, 55@60c.

BULLION MARKET.

New York, Friday Evening, April 20.

The market abroad and here has been without any special feature since our last week's report.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended April 20th, as compiled from various sources, amounted to $191,000, as against $254,505.45 reported for the previous week. The receipts from January 1st, 1883, to date are $4,263,713.53.

United States Assay-Office at New York.—Statement of business for the month ended March 31st, 1883:

Deposits of gold:		
Foreign coin	$343,000.00

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended April 14th	$259,283
Corresponding week last year	503,000
Since January 1st, 1883	4,787,117
Corresponding period last year	14,490,253

Imports.

Week ended April 14th	$611,430
Corresponding week last year	6,356
Since January 1st, 1883	6,395,936
Corresponding period last year	1,116,957

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 3 per cent. During the week, the bank lost £240,000 bullion, but the proportion of its reserve to its liabilities was raised from 36 15-17 to 37 7-16 per cent, against 44 3-16 per cent at the same date last year. April 19th the bank gained £60,000 bullion on balance. The weekly statement of the Bank of France shows gains of 4,325,000 francs gold and 2,800,000 francs silver.

METALS.

New York, Friday Evening, April 20.

Copper.—So far as lake copper is concerned, there is a slightly better feeling; and though sales were made earlier in the week at 15¾c., it would be impossible at present to secure any copper of this description at less than 15⅞@16c. Brands other than Lake are still weak, selling within the range of 14⅝@15⅛c., and we hear of occasional lower figures. It must be remembered, however, that the lower figures are for grades below good standard quality, and for unknown brands; in fact, the struggle to introduce a variety of brands has much to do with the exceptional figures which are so freely used by buyers.

According to the Bureau of Statistics, the imports of copper ore for February were 45,747 cwts., valued at $5298. The imports of pig and old copper were only 24,181 pounds. The exports of copper ore in February were 7365 cwts., valued at $107,500, and of pig-copper, 90,798 pounds.

Under date of April 2d, Messrs. James & Shakspeare say:

It would seem that the total quantity of Lake copper bought does not exceed 4500 tons, and it is said that no further shipments from that source will be made.

Under date of April 5th, Messrs. French & Smith quote: Ores, 12@13 shillings per unit. Canadian Regulus commanded 13s.; Chilian, 13s. 3d.; and ores, from 12s. 6d. to 13s. Among the latter, we note a sale of 70 tons of Butte Mountain at 13s.

Messrs. James & Shakspeare have published the following statistics of copper in England and France, including metal afloat on March 31st:

		—March 1 to 31.— Imports. Tons.	Deliveries. Tons.	
Fine foreign, chiefly Australian		584	600	London.
Chili.	Bars and ingots	2,904	1,388	Liverpool
	In ores and regulus	10	160	and
Precipitate and sundries		1,730	1,447	Swansea.
Totals, England		5,228	3,604	
Fine foreign, chiefly American		65	70	France.
Chili bars, ingots, and Barilla		1,183	1,930	
		6,476	5,604	

	Stocks. Mar. 31. Tons.	Mar. 15. Tons.	Feb. 28. Tons.	
Fine foreign, chiefly Australian	4,546	4,345	4,571	London.
Chili. Bars and ingots	24,970	23,260	23,454	Liverpool and Swansea.
Chili. In ores and regulus	2,220	2,370	2,370	
Precipitate and sundries	3,606	4,174	3,323	
Totals, England	35,342	34,149	33,718	
Fine foreign, chiefly American	75	80	80	France.
Chili bars, ingots, and Barilla	2,695	2,358	3,442	
	38,112	36,887	37,240	
Advised by mail and telegram:				
Chili	8,024	8,440	8,493	
Australian	2,000	1,150	1,000	
	48,136	46,477	46,733	

		—Jan. 1 to March 31.— 1883. Tons.	1882. Tons.	1881. Tons.
Imports..	Chili	11,476	8,369	7,634
	Other foreign	9,305	10,079	8,208
		20,781	18,448	15,842
Deliveries..	Chili	9,073	10,437	10,824
	Other	8,723	6,691	6,660
		17,796	17,038	17,484

England is lower, cable quotations being £63@£63 5s., a drop of nearly a pound sterling.

Tin.—The arrival of 600 tons of tin in this port has had the effect of making the market dull and lifeless, buyers resuming an attitude of expectancy. We quote 21c. for straight spot, large lines. England cables £96 10s. @£96 15s.

Lead.—The available stock being concentrated in a few strong hands, successive bids upward from 4·40 @4·60c. have been declined, and the market closes strong though quiet, with a fair inquiry. We quote nominally, 4·62½@4·65c. for Common and Domestic. Two hundred tons of Germania lead have gone into store, and 500 arrived to-day have not as yet been disposed of in any way. We can not hear of a single wholesale transaction during the week.

Messrs. John Wahl & Co. of St. Louis wire as follows to-day: The market is strong and the demand good. It is very steady, with some advances on last week's quotations on Hard lead. Sales for the week sum up over 260 tons of Chemical lead at 4·17c. and 230 tons of Refined lead at 4·25c.

Spelter.—One of the large producers of the West yesterday raised his price 10 cents per hundred pounds, to 4·35c., which, with freight 43½ cents per hundred pounds, would bring it up to 4·80c. here. There is, however, little trouble in securing a trifle lower figures here, from the stocks in the hands of the trade. We quote 4·75@4·80c. for Common Domestic, and 5·12@5·37c. for Silesian.

The February imports of spelter were light, being only 324,447 pounds of spelter and 256,094 pounds of sheet-zinc.

Antimony.—This metal is quiet at 10·85@11c. for Cookson's, and 9⅛@10c. for Hallett's.

IRON MARKET REVIEW.

New York, Friday Evening, April 20.

Our February imports of iron and steel were as follows:

February.	1883.	1882.
Pig-iron, net tons	21,547	30,320
Bar-iron, "	2,676	6,672
Band, hoop, and scroll, net tons	278	40
Iron rails, net tons	23	8,211
Sheet-iron, "	344	469
Old and scrap, "	5,960	17,222
Steel rails, "	11,565	13,512
Steel ingots, bars, sheets, and wire	$957,772	$1,029,058

A temporary organization of the two Iron and Metal Exchanges, under the consolidation plan, has been formed by the election of John C. Cook, of Messrs. Bruce & Cook, President; George P. Thompkins, of Messrs. O. E. Schmidt & Co., Vice-President; E. J. Shriver, Secretary; and James E. Pope, Treasurer.

American Pig.—The event of the week has been the announcement to-day, by the Thomas Iron Company, that it had decided to reduce its quotations for Nos. 1 and 2 Foundry Pig from $24 and $22, respectively, to $22 and $20, a drop of $2 per ton. In view of the fact that for many weeks past the demand for Foundry Pig has been on a very limited scale, and that the little business for urgent needs has been picked up by the makers of outside brands, who, as our quotations showed, were cutting under considerably, this move was a wise one. Consumers have not, as in former years, contracted far ahead for season delivery; and as we intimated in our last, the accumulation of stocks was encouraging them to look for lower figures. It is, of course, too early to form any estimate of the effect of the reduction now made; but consumers will certainly have no reason to complain that it is not sweeping enough. It is reported that two of the Thomas furnaces are to be blown out, which seems to indicate that the management, which is known in the trade to be averse to any accumulation of stocks, does not look forward to a heavy demand in the near future. Thus far, we do not learn that the Crane or Allentown companies have followed suit in reducing quotations. We quote No. 1 Foundry, nominally $22@$24, which the makers of less well-known brands will have to shade; No. 2, $20@$21.50; and Gray Forge, $18.50@$19.50. Bessemer Pig is quiet at $22 asked for American. Spiegeleisen, at least so far as the higher grade is concerned, has improved upon more inquiry. We quote for 20 per cent, $32.50 @$33, while 12 to 15 per cent, for which there is less demand, is still nominally $26.

Scotch Pig.—Sales aggregating 600 or 700 tons have been made in small lots. The arrivals are small, but partially go into store. The spot stocks are light, and in the case of some brands are exhausted. On the

Digitized by Google

whole, quotations for immediate delivery are materially higher than futures. We quote spot, $24.50@24.75 on dock, and $24@24.25 June delivery; Dallmellington, $21.50@$22; Glengarnock, $22@22.50; and Eglinton, $21.50 in yard. At the Wall Street Exchange, the following cables were received to-day, showing a decline in the better brands: Carnbroe, 54s. 6d.; Gartsherrie, 60s.; Summerlee, 60s. 9d.; Coltness, 62s. 9d.; Langloan, 63s. 6d.; Glengarnock, 54s. 3d.; and Eglinton, 48s. 6d. Warrants were 47s. 3d. Freights are unchanged, 5s.

Rails.—During the week, there have been sales aggregating 25,000 tons, partly at mill, at $38@$39, and partly at tidewater, at $39.75@$40, which figures we quote. The feeling is a little better. England is low, cabling £4 15s.@£5 at shipping port. British exports to this country in March were only 4957 tons.

Old Rails.—Old rails are fairly steady at quotations ranging from $24@$24.50 for spot, and $23.50@$24 for future delivery. A sale is reported to us of 500 tons of D. Hs. at private terms.

Scrap-Iron.—The market is dull, nominally at $25.

Philadelphia. April 20.

Pig-Iron.—The sales of pig-iron in Eastern Pennsylvania since Monday have been smaller than usual, and buyers are purchasing for current requirements. A few negotiations in hand for large lots have been bruptly terminated. The outlook is less encouraging an a week ago for inferior irons; though for some of the finer brands, prices are firmly maintained and concessions have been refused for future deliveries. Gray forge iron is the weakest on the list. Makers of finished iron see no inducement to cover requirements for from sixty to ninety days. Quotations run from $18, at furnace, to $20.50. Average brands are selling at $19@$19.50. No additional restriction has been heard of, though several companies contemplate blowing out unless there is an improvement. Stocks are sufficient to sustain the hope of consumers that prices may yet decline still further, notwithstanding the fact that there is no room for any legitimate decline. Inferior Foundry irons are selling at $23.50@$24 and good foundry brands from $24@$25. No. 2 lots were disposed of at $22.50. Prices have taken a wider range than usual this week. English and Scotch are unusually dull. Sellers have endeavored to dispose of a few hundred tons, but founders buy only for actual requirements. Consumers desire to run close until after July. Bessemer iron would sell at $21.50, but at $22.50, the price asked, nothing of any account is done.

Muck Bar.—A few hundred tons of Muck Bar have been sold for May delivery at $35@$35.50. Offers are in hand at $34.50, and will probably be accepted. Four or five transactions in Charcoal Blooms were made at prices varying from $60@$66, according to quality of bloom and location; for good quality, $63.50 $64 is a fair average, and for Anthracite, $54@$56 are the limits.

The bar mills of Eastern Pennsylvania have good cause for complaint at the condition of business. The card rates are not maintained; but within two or three days, sufficient new business came to hand to afford encouragement that the worst had been reached, the bottom touched, and an improvement probable. There is more capacity for making iron than under ordinary conditions there is demand for, and manufacturers are anxious to secure orders at 2·20c., but buyers hold back and purchase for immediate requirements. Small lots are selling at 2·20@2·25c. Large orders have been placed at as low as 2c, but 2·10@2·20c. will now cover all the business done. The possibility of a general suspension in the West is contemplated, and would be beneficial to the trade.

Nails.—A large amount of business has been done recently in nails, and for small lots prices have improved, though large buyers can still secure valuable concessions, especially in the West. Prices run from $3.10@$3.30, according to amount of order. Factories will continue the maximum output indefinitely. The requirements of the trade are large.

Shapes.—A few orders for bridge iron and boiler plate have been secured this week, and specifications are expected next week for larger lots for structural iron. Concessions are extended and prices are weak, though mills are not all suffering for want of business, and bridge works in all parts of the country are well supplied with orders. Manufacturers of structural iron and plate and tank express themselves as pleased with the present and future prospects of the trade, and believe that remunerative prices can be maintained, notwithstanding the complaints made in several quarters of declining activity.

Steel Rail transactions foot up 30,000 tons for the week, and there are inquiries on hand for 40,000 more in Eastern and Western mills, which will be placed if offers are accepted. Quotations for smaller lots are held with more firmness in the neighborhood of $40.

Old material is not selling. There are no stocks on hand, and the offers made are not acceptable to buyers. American rails are selling from $23.50@$25, according to size of order and place of delivery. Scrap transactions are insignificant, and prices run from $24.50@$28, according to quality, the extremes being exceptional.

Cleveland. April 18.

The trade for the past week in volume has been quite satisfactory, and there has been no cutting or falling off in prices.

The buying seems to be principally for immediate wants, although some few contracts have been made for several months' delivery. The prospects are for a large volume of trade for the present year, at low values; but this may be upset by labor troubles.

There has been considerable ore contracted for, principally the lower grades; but furnaces, as a rule, are disposed to buy only for short wants.

We quote:

No. 1 Bessemer	$23.00@$24.00
" Foundry, all ore	22.00@ 23.50
" Foundry, cinder mixture	21.00@ 22.50
" Soft Foundry	20.00@ 21.00
" Open silvery	19.00@ 20.00

Bessemer ores	7.00@ 8.50
Hematite "	5.00@ 6.00

COAL TRADE REVIEW.

Anthracite.

NEW YORK, Friday Evening, April 20.

The trade has fallen into a state of absolute quietude, and accordingly the prices at which coal is selling are extremely irregular. Buyers, who were taken aback by the high spring rates, seem confident that they will have no difficulty in securing their supplies at low figures. The fact that until the close of the month there will be full work at the mines is not calculated to discourage their hope, and coal is accumulating on the hands of those who are not forced to market it. The manufacturing demand is slack, and the latest news from the anthracite furnaces is not hopeful. Broken and egg are particularly weak.

Mr. John H. Jones, official accountant, has just published the following statement of the anthracite coal tonnage for March:

	March, 1883.	For year 1883.	For year 1882.	Differ'ce.
Phila. & Reading RR.	536,488	1,477,142	1,264,587	I. 212,555
Lehigh Valley RR.	*509,061	1,342,026	1,142,295	I. 199,732
Central RR. of N. J.	366,061	950,874	806,889	I. 143,984
Del., Lack. & W. RR.	371,132	1,018,019	900,741	I. 117,278
Del. & Hud. Canal Co.	†267,799	710,386	663,156	I. 47,230
Pennsylvania RR.	188,577	515,896	446,517	I. 69,379
Penna. Coal Co.	105,592	298,897	260,309	I. 38,588
N. Y., L. E. & W. RR	30,801	76,010	46,417	I. 29,593
Total.	2,375,512	6,389,251	5,530,913	I. 558,338

* This amount includes the production of the mines of the State Line and Sullivan RR. Co., amounting to 6643 tons.

† In addition there were 39,914 tons transported from mines by D. & H. C. Co. during March, which is included in tonnage of other interests.

The stock of coal on hand at tide-water shipping points, March 31st, 1883, was 598,192 tons; on February 28th, 1883, 575,695 tons; increase, 22,497 tons.

A meeting of the Western Association was held in this city this week. It is understood that prices have been fixed which are slightly higher than the opening figures of last year. They have, however, been arranged on a different basis. As yet the circular has not been officially issued.

The latest news from the East is, that a war has broken out between the retail dealers and the peddlers, and that the former have put down prices considerably.

Bituminous.

There is little that is new in the bituminous trade, except that the feeling of uncertainty is greater than ever, as having an important bearing upon the possible relations of the two railroads, the Baltimore & Ohio and the Pennsylvania. The trade is discussing with much earnestness the fact that the former company has executed a mortgage upon its proposed Philadelphia branch, to secure a proposed issue of £2,400,000 sterling 4½ per cent bonds. It is argued that the Pennsylvania Company is not likely to look at any move to get into Philadelphia with placid good feeling, and that it is possible it will retaliate by cutting into the Cumberland, in giving the Clearfield operators low rates.

Business here is exceedingly dull, and we hear of all sorts of low prices. We are unable to verify a statement that a Cumberland company received the New York & New England Railroad's contract. In fact, we have every reason to believe that it is still open. The aim especially of the Clearfield operators appears to have been to prevent the closing of any contracts, and so far they have certainly been very successful. We quote, alongside, nominally, Clearfield, $4.25@$4.40, and Cumberland, $4.35@$4.60, according to quality.

Horsford's Acid Phosphate

is an appetizer; it stimulates the stomach to renewed activity, and in many ways tones up and invigorates the whole system.

IT is reported that extensive deposits of phosphates have been discovered in Poland. English capitalists, it is said, are investing heavily.

IT is reported that a deposit of zinc ore has been discovered a few miles from the famous Friedensville mines, Pennsylvania. The latter are suffering from an increased influx of water. Should the new discovery prove all that is hoped for it, Eastern spelter production would receive a new impetus.

IN the editorial, "The New York Water Supply," in our issue of April 21st, page 218, last line but one of the article, please read, "a masonry dam **230** feet high." Those were the figures in the Editor's copy ; and they actually got into type as he wrote them ; but afterward, the cipher, not realizing its importance, dropped out.

THE Ohio Institute of Mining Engineers, an association formed within the past year, is exhibiting every sign of vigorous growth, under the progressive management of such officers as ANDREW ROY, President, and R. S. PAUL, Secretary. The next meeting, we are informed, is to be held on the 9th of May at Youngstown. A number of interesting topics are to be discussed.

MR. JAMES PARK, Jr., the great Pittsburg steel manufacturer, died suddenly of apoplexy on the 21st inst. He was born in Pittsburg on January 11th, 1820. He was first in his father's grocery and metal business ; but in 1843 built a copper rolling-mill. In 1862, the Black Diamond Steel-Works was erected, and Mr. PARK became one of the pioneers of the crucible tool steel trade. He was one of the most prominent and active of the members of the Tariff Commission, the work connected with it being the crowning effort of a busy life.

THE best indications of the capacity of the Spanish lead mines to work along under the prevailing low prices of the metal in the markets of the world is furnished by the reports of the English companies working there. According to the financial statement of the directors of the Linares, Fortuna, and Allamillos companies for the half-year ended December 31st, 1882, these companies did well, although the prices of lead ranged within the extremely low limit of £13 and £13 10s. The Linares made a profit of £2283, against £730 during the previous half-year ; the Fortuna ran its net returns up from £2454 to £3609 ; while the Alamillos declined from £4387 to £3666. In all cases, the cost of production was notably decreased, so that, if we should ever be forced to become exporters of lead, as some pessimists believe we must be in the early future, we should have to meet very low figures.

IT is announced that the Western iron manufacturers have decided to reconsider their recent ultimatum to reduce wages 10 per cent, and to afford the men an opportunity, on Thursday next, at a conference to be held at Pittsburg, to come to an understanding as to the scale to rule after June 1st. Any one who has followed developments in the finished iron trade during the first quarter of the present year will recognize that its position is, if any thing, worse than last year. There can be little doubt that we are, in the present condition of consumptive interests, suffering from over production, and a restriction, voluntary or enforced by a strike, is necessary, unless business is stimulated by low prices. It can not be expected that the manufacturers will bear the brunt of poor trade alone, and the sooner the men recognize this fact, the better. Their employers have much to gain and little to lose, while the men will be called upon to endure all the sufferings which idleness entails.

SLICKENS.

This word, probably brought into Cornwall by German miners, and signifying slimes (as its derivative, *slickensides*, signifies the smooth faces caused by the movements of rock-masses, and often covered with slippery clay), is now acquiring a portentous importance in the affairs of California. The great struggle between the hydraulic miners and the farmers of that State turns on *slickens*, which in this case is the *débris* of the hydraulic mines, minus the pebbles and boulders, or, in other words, the material carried in suspension by the rivers and re-deposited at lower points.

The following analyses of *slickens*, made for purposes of the pending litigation, are worth preserving :

	I.	II.	III.	IV.	V.	VI.
Silica	80·500	68·90	90·05	70·00	59·88	58·26

I. Sand from Gold Run mine, on bed-rock, sample taken October 19th, 1881, by P. M. RANDALL and W. A. SKIDMORE. Analysis by FALKENAU and RUSE, State Assayers.
II. Sand from Gold Run mine, 180 feet above bed-rock. Sample taken and analyzed as above.
III. Sand taken 300 feet above junction of North and Middle Forks of American River, October 20th, 1881. Analysts, etc., as above.
IV. Sand from American River, 200 feet above junction with Sacramento, taken October 21st, 1881. Analysts as above.
V. Slickens from the banks of the Sacramento. Analyzed by THOMAS PRICE.
VI. Slickens from Butte Co. Analyzed by H. G. HANKS.

These analyses are less valuable for the purpose in view than a thorough microscopic mechanical analysis would have been. Their principal sig-

Digitized by Google

nificance in the pending case is the proof they offer that the sands of the Gold Run mine contain little or no mica, while the sands taken near Sacramento contain a good deal. Mr. SKIDMORE writes: "In the course of the examinations which devolved upon me, I could not find any mining alluvium in San Francisco Bay or San Pablo Bay. We did not strike sand until we had passed the Straits of Carquinez. Near the old steamboat landing of Collinsville, on the Sacramento River, we first struck the invading sands; and here mica was predominant, showing it must have come from at least 100 miles distant, since there is no granite country nearer than Folsom and Auburn."

These observations show that the common talk of the injury done to San Francisco Bay by the mining *débris* is unfounded. The simple fact is, that the cultivation of the Sacramento and San Joaquin valleys, increasing as it does the amount of alluvium annually washed into those rivers, is largely responsible for the effects appearing below. But there is no doubt that, farther up the streams, lands have been injured or destroyed by the *débris* of the mines, though we think the extent of the damage has been overrated, and the spirit in which the mining companies are now pursued indicates on the part of the farmers the desire rather for plunder than for justice. Their demands have constantly grown with their successes; and nothing will now satisfy them but the entire suppression of the hydraulic mining industry.

The following summary of the history and present condition of this litigation will interest our readers:

The first case of importance was that of KEYES *vs.* Little York Company and thirty-eight other defendants, begun July 29th, 1876. After a long trial, wherein the best legal and engineering talent in the State was employed, a judgment was rendered against the mines. The case was appealed to the Supreme Court of California, where it was reversed on a point raised by demurrer, on the ground of misjoinder of parties defendant.

The city of Marysville then brought suit (September 15th, 1879) against the North Bloomfield Gravel Mining Company and thirty-two other companies. They included about 200 persons as defendants. The defendants appealed to the Supreme Court from the injunction issued in that suit and also demurred, and applied for change of the place of trial on the ground that the presiding judge was prejudiced. The motion was refused, and an appeal was taken to the Supreme Court, where it is now pending.

Then the State of California, by its attorney-general, brought an action against the Miocene Mining Company, of Butte County. This being a foreign corporation, the case was transferred to the U. S. Circuit Court for the District of California. Defendants demurred, the principal ground being the want of authority of the attorney-general to use the name of the State. The question was argued orally, and in addition briefs were filed and the matter submitted. Up to this time, Judge SAWYER has not rendered a decision.

Simultaneously with the above action, the attorney-general commenced suit (June 28th, 1881) against the Gold Run Mining Company of Placer County. Defendants, through the counsel of the Miners' Association, demurred and answered. The trial came on in October, 1881, and occupied the court sixty days. The presiding judge (TEMPLE) rendered a decision June 12th, 1881, sustaining the injunction, with a qualification that, on a proper showing of the construction of dams to restrain the coarse material, he would entertain a motion to dissolve the injunction. The point raised on demurrer as to want of authority of the attorney-general to use the name of the State was not decided, but referred to the Appellate Court. Neither party fully acquiesced in the decision. Defendants appealed to the Supreme Court, and plaintiff took a cross-appeal.

Then the county of Yuba sued the Excelsior Water and Mining Company, the Eureka Lake and Yuba Canal Company Consolidated, the Blue Tent Consolidated Hydraulic Gold Mines of California, Limited, and the Yuba River Gold Washing Company. Injunctions were issued in all these cases *ex parte* and without notice to the defendants.

Then came the suit of the county of Sutter *vs.* J. T. HICKEY *et al.*, commenced April 4th, 1882, in the county of Colusa. The defendants' mine is in Nevada County. Also, at about the same time, a suit was begun against the Birdseye Creek Company, of Placer County.

The last action brought is that of EDWARDS WOODRUFF *vs.* North Bloomfield Gravel Mining Company, Milton Mining and Water Company, and some eight other companies. It is substantially of the same nature as the others, praying for a perpetual injunction. WOODRUFF being a citizen of another State, the suit was brought in the Circuit Court of the United States, Judge SAWYER presiding. Defendants demurred on the ground of misjoinder of parties defendant. The demurrer was argued by the ablest counsel in the State, occupying the court two weeks. Judge SAWYER held that the demurrer was not tenable, and required defendant to answer on May 9th.

The decision of Judge TEMPLE, in June, 1881, indicated the solution which the miners must make up their minds to accept. They declare that they are ready and willing to build dams; but their opponents are not so willing to have this remedy applied. It is claimed that, sooner or later, such dams will give way, and let loose vast accumulations of *débris* to desolate the plains. In the present attitude of the courts, however, we presume that the construction of dams by the mining companies will be accepted, and injunctions will not be continued thereafter.

An effort has been made to get aid from the Federal government in the building of such dams. But it has failed—and, though we sympathize with the troubles of our hydraulic mining friends, we must frankly say that we do not think it a fair case for national expenditure. The best that could be said for it would be that it was less improper than many of the items in the River and Harbor bill. However, that need not be argued now. The miners generally expect to build their own dams. These dams will restrain the coarser material, but not the finest *slickens*.

The various companies operating on the Yuba are reported to be doing better than at any time in their history. That is, the ground is paying more per cubic yard and per inch of water. But the effect of the litigation has been disastrous in many ways. Capital has been driven from the State. Real estate has depreciated in the mining counties; and great works in contemplation have been suspended or abandoned. The alliance of Kearneyism and Grangerism, which has given vigor to various crusades against capital in California, is probably responsible for the loud complaint of "dull times" in the State. Nobody appears to be happy there except the Chinese, who, having been protected by law against the competition of their countrymen, naturally feel that they have the best of the bargain. Altogether, it is a pretty picture of the boomerang in politics.

GUNS AND ARMOR.

The comparative inactivity of our government in matters of coast and maritime defense for years past has had one compensation. Other nations have spent many millions in costly experiments, gradually perfecting both heavy guns and armor; and we now get the benefit of their discoveries. The armaments, afloat or ashore, with which we ended the war in 1865 are out of fashion long ago. Apart from our ingenious, but almost untried, stationary and moving torpedoes, there would be nothing to-day to prevent first-class iron-clads, such as are owned by more than one second or third-rate power, from getting near enough to bombard any of our great coast cities. It will not be safe to trust our luck forever. The defense of our harbors should be seriously prepared. And while it may be that the art of war will be yet farther advanced, there are signs that the limit of progress, on the lines hitherto pursued, has been nearly reached, both as to size of guns and as to thickness of floating armor.

The U. S. Board of Engineers for Fortifications has recently submitted (*Professional Papers of the Corps of Engineers, U. S. Army*, No. 25) a valuable report upon the practice in Europe with the heavy Armstrong, Woolwich, and Krupp rifled guns. The conclusions of this report are as follows:

"Experimental firings for penetration during the past twenty years have determined:

"1st. That wrought-iron and cast-iron, unless chilled, are unsuitable for projectiles to be used against iron armor; that the best material for that purpose is hammered steel or Whitworth's compressed steel.

"2d. That cast-iron and cast-steel armor-plates will break up under the impact of the heaviest projectiles now in service unless made so thick as to exclude their use in ship protection.

"3d. That wrought-iron plates have been so perfected that they do not break up, but are penetrated by displacement or crowding aside of the material in the path of the shot, the rate of penetration bearing an approximately determined ratio to the striking energy of the projectile, measured per inch of shot's circumference, as expressed by the following formula:

$$\text{Penetration} = 2{\cdot}035 \sqrt{\frac{V^2 P}{2g \times 2r\pi \times 2240 \times 0{\cdot}86}} \text{ in inches.}$$

V = velocity in feet per second; P = weight of shot in pounds; r = radius of shot in inches.

"That such plates can, therefore, be safely used in ship construction, their thickness being determined by the limit of flotation and the protection needed.

"4th. That though experiments with wrought-iron plates faced with steel have not been sufficiently extended to determine the best combination of these two materials, we may nevertheless assume that they give a resistance about one fourth greater than those of homogeneous iron.

"5th. That hammered steel in the late Spezzia trials proved superior to any other material hitherto tested for armor-plates. The 19-inch plate resisted penetration and was only partially broken up by four shots, three of which had a striking energy of between 33,000 and 34,000 foot-tons each. Not one shot penetrated the plate. Those of chilled iron were broken up, and the steel projectile, though of excellent quality, was set up to about two thirds of its length. This experiment seems to promise the solution of the problem to determine a material for armor-plates which, though limited in thickness to the carrying capacity of the ship to be protected, will still have sufficient resistance to break up the projectiles of the largest guns now in the naval service, without being penetrated or broken by the projectile.

"It seems probable that a hammered-steel plate, like that tried at Spezzia, if equal in thickness to the belt armor of the Inflexible (22 inches), would stop the shot of the 100-ton gun (Armstrong), fired with its greatest practicable velocity.

"Finally, these later experiments confirm this Board in its opinion, enunciated some years since, that, while the 12-inch rifled gun may prove a sufficient armament for the barbette batteries of our sea-coast defenses, as against the lighter iron-clads of foreign navies, iron turrets, armed with guns of 100 tons weight at least, will be needed to meet the attack of armored ships of the latest construction."

The 100-ton chambered Armstrong gun, throwing a projectile of a ton weight, and fired with a charge of over 700 pounds of powder, may be taken as a sample of the monstrous requirements of modern war. Such guns must be both made and operated by machinery. A larger steam-hammer

Digitized by Google

than any now in this country is required to make them. These are pre-eminently the things which can not be improvised in a sudden emergency, and which should therefore be prudently prepared in time of peace. We are strong in the particulars in which we are least exposed to danger. The patriotism and valor of our citizens may be relied upon to repel invasion—but nobody is likely to invade us; and all our martial ardor would not prevent a single modern armored ship from levying a forced contribution upon the city of New York, in defiance of the puny cannon of the last generation which grin harmlessly from the forts of the harbor. *

The Metal Exchange Reorganization.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In reply to an article in yesterday's *Iron Age* on "The Metal Exchange Reorganization," I would like to record my hearty concurrence in one sentiment expressed therein—that there has been "too much of calling names and making faces," and am only sorry that the editor has lost his temper in a professional and, I trust, Pickwickian sort of way, instead of quietly taking for his paper a fair share of punishment in a discussion he himself provoked. Yours truly,

NEW YORK, April 27. EDWARD J. SHRIVER.

ANALYSIS OF THE FRANKLINITE ORES OF NEW JERSEY.*

By Dr. Pierre De P. Ricketts.

Some time since, my attention was called to the question of determining a method for estimating the amount of red oxide of zinc contained in certain deposits of these Franklinite ores. Some of the results obtained have not been published, other than in the testimony taken in lawsuits about these deposits.

The methods employed were briefly as follows: The first was a mechanical separation, made by Mr. A. F. Wendt and myself, for the purpose of obtaining the mineral constituents of the samples treated, as nearly as possible. The ore was crushed down to below 40 meshes to the inch, and sieved. The Franklinite was then extracted by the magnet from an average portion of the sample, and the red oxide separated by hand, under a powerful magnifying-glass, from the residue, by using a fine wire with a small hook at the end. The result of the separation of the 1700-ton sample was:

	A.	B.
Franklinite	48·2 per cent.	44·7 per cent.
Red oxide	2·7 "	7·4 "
Silicates and carbonates	49·1 "	47·9 "
	100·0	100·0

The next method adopted was to take average samples of the Franklinite ore, carefully separate from a portion of the sample the mineral constituents contained in the same, and analyze the separated minerals. Several analyses of average samples were then made, and from these, and the analysis of the separated minerals, the mineralogical constitution of the ores was calculated.

The complete analyses of the average samples were as follows:

	A.	B.	C.	D.
Silica	11·85	11·59	8·64	10·70
Oxide of zinc	34·13	40·33	34·70	33·09
Proto-sesqui-oxide of iron	28·48	29·94	28·34	31·05
Alumina	0·58	trace.	trace.	trace.
Protoxide of manganese	14·13	8·35	15·50	15·51
Lime	5·51	4·16	5·70	4·59
Magnesia	0·13	0·79	1·44	0·27
Carbonic acid	4·96	4·12	6·26	4·38
Copper	0·07	undetermined.	trace.	trace.
	99·84	99·78	100·58	99·59

The analysis of the constituent minerals gave the following figures, as representative of their constitution, after separating and cleaning them from adhering gangue, etc., under a magnifying-glass:

	A. Franklinite.	B. Zincite.	C. Willemite residue.
Silica and insoluble matter	2·62	0·81	24·36
Oxide of zinc	21·60	95·23	48·06
Proto-sesqui-oxide of iron	55·80	trace.	1·97
Alumina	trace.	trace.	.....
Protoxide of magnesia	17·06	3·51	12·25
Lime	1·28	0·32	6·29
Magnesia	0·30	0·10	0·99
Carbonic acid	1·35	0·37	6·28
Copper	none.	undetermined.	trace.
	100·04	100·34	100·20

The Franklinite, after deducting foreign constituents, such as silica, magnesia, lime, etc., would have the following composition: Oxide of zinc, 22·90; protoxide of manganese, 18·08; and proto-sesqui-oxide of iron, 59·15. The zincite, allowing for the impurities which even careful picking could not separate, would have the following constitution: Oxide of zinc, 96·44; protoxide of manganese, 3·55; proto-sesqui-oxide of iron, a trace. The Willemite analyzed evidently contained considerable limestone and impurities, and although the analysis is stated, it was thought safer to take the composition of Willemite as given by Dana, in calculating the mineralogical constituents of the ore. Taking the analysis of sample marked "A," considering the constitution of the Franklinite and zinc as determined, and using the mechanical separation marked "A," we should have the following as the mineralogical composition of the sample:

Zincite.		Franklinite.		Willemite (Dana).	
ZnO	96·44		22·90		72·90 per cent.
MnO	3·55		18·08	SiO_2	27·10 " "
Fe_3O_4			59·15		

Mechanical separation of 1700-ton sample gave: Franklinite 48·2; Zincite 2·7; Silicates and carbonates 49·1

By computing the quantity of oxide of zinc in the Franklinite and zincite, 20·49 per cent of oxide of zinc remain in sample "A" for Willemite, which, requiring 7·617 per cent of silica, would correspond to 28·107 of Willemite.

Deducting the silica for the Willemite from the total silica, and the amount for the alumina present, a balance of 3·893 of silica remains, which would require 4·589 per cent of protoxide of manganese, equal to 8·482 of rhodonite. By analyses, the carbonates of lime and magnesia were 10·110 per cent, leaving a difference of 1·481, of which 1·270 per cent would be carbonate of manganese, calculated from the excess of carbonic acid, leaving 0·211 for copper, etc.

The following is a statement of the mineralogical composition of the ore, as calculated from the analysis:

	SiO_2.	ZnO.	Fe_3O_4.	MnO.	Al_2O_3.	CO_2.	CaO and MgO.	Calculated.
Franklinite	.....	11·04	28·51	8·710	.....	.....	.....	48·200
Willemite	7·617	20·49	.....	.....	.....	.....	.....	28·107
Silicate of alumina, etc.	0·340	.....	.....	.....	0·58	.....	.....	0·920
Red oxide	.....	2·60	.....	0·100	.....	.....	.....	2·700
Rhodonite	3·893	.....	.....	4·589	.....	.....	.....	8·482
Carbonate of manganese	.....	.....	.....	0·780	.....	0·49	.....	1·270
Limestone	.....	.....	.....	.....	.....	4·47	5·64	10·110
Copper, etc	.....	.....	.....	.....	.....	.....	.....	0·211
Totals	11·850	34·13	28·51	14·179	0·58	4·96	5·64	100·000
Found by analysis	11·850	34·13	28·48	14·130	0·58	4·96	5·64	99·770

To check this calculation, the average composition of Franklinite, Willemite, and zincite, as given by Dana, were used in connection with the mechanical separation already referred to, and the calculation made as to the composition of Sample "A," with the results given below:

Zincite.		Franklinite.		Willemite.	
ZnO	95·20	ZnO	20·72	ZnO	69·97
MnO	3·19	MnO	12·72	MnO	1·14
		Fe_3O_4	63·90	Fe_3O_4	trace
				SiO_2	16·81

Franklinite	48·2	
Zincite	2·7	
Willemite	38·84	= 38·64 silicates.
Rhodonite	7·80	
Limestone	10·11	= 11·38 carbonates.
Carb. manganese	1·27	
	100·92	50·02 per cent silicates and carbonates.

Other methods of calculation were employed, such as applying the various standard analyses of Franklinite to the complete analysis given, considering that all the iron found came from the Franklinite, and using that as a starting-point. For instance, taking an analysis of Franklinite as given by Cook, and applying it to complete analysis marked "D," we should obtain the following calculation and results:

The analysis of Franklinite gives sesqui-oxide of iron, 62·36—equivalent to proto-sesqui-oxide, 60·28; oxide of zinc, 22·95; protoxide of manganese, 17·20. Taking the proto-sesqui-oxide of iron in the sample at 31·05, and comparing with the proto-sesqui-oxide of iron in 100 parts as found in the Franklinite, the amount of Franklinite corresponding to 31·05 is easily obtained. Calculating the silicate of manganese as rhodonite, taking all the oxide of zinc necessary for silica, etc., and calling what remains red oxide, we should have the approximate mineralogical composition of Sample "D":

Franklinite	51·51
Red oxide of zinc	6·40
Rhodonite	11·13
Willemite	20·23
Carbonate of manganese	1·24
Limestone	8·76
	99·27

The next trial made was to determine some solvent which would dissolve the red oxide of zinc, and practically leave the other mineral constituents, with the exception of the limestone, unacted on.

THE Massachusetts Institute of Technology, of Boston, which begins its next school year on September 24th, has set aside the following dates for entrance examinations: May 31st, June 1st, and September 18th and 19th.

* Abstract of a paper read before the New York Academy of Sciences.

NEW PUBLICATIONS.

MANUAL OF ASSAYING GOLD, SILVER, COPPER, AND LEAD ORES. By WALTER LEE BROWN, B.Sc. With Illustrations. Chicago: Jansen, McClurg & Co. 1888. 12mo, 318 pages. (*Index.*) Price, $1.75.

Mr. Walter Lee Brown, who has had much experience as a chemist and assayer, has endeavored, we may add with marked success, to prepare a work on assaying which will aid those who have had no previous scientific or technical training. Those who have had occasion to train youths fresh from school, to make them competent assistants, have, we believe, generally felt that the standard works of Mitchell, Ricketts, and Kerl are, on the whole, not available as guides to this class of beginners, however high they stand as text-books for those who have gone through a course of chemistry and assaying. Mr. Brown probably will agree with us that in many cases it may be deplored that our assayers, or those who would enter that branch of the profession, have not obtained that preliminary training. Still, the fact remains that there is a large class of such men; and in filling the large demand for a work suitable as a guide to them, Mr. Brown has done them a service, and has, at the same time, we believe, lightened the labor of those who are forced by circumstances to train assistants.

Mr. Brown's work is, of course, essentially elementary. He devotes a long chapter to a description of the apparatus used in assaying, to the reagents, and to testing them. His second part, treating of the assays of gold, silver, copper, and lead ores, is full and, we believe, within the grasp of any beginner. We note some little points where perhaps he is not quite elementary enough. Thus, for instance, in speaking of preliminary roasting of silver ores in the scorification assay, he says, "Whenever an ore contains a large amount of antimony, arsenic, sulphur, or zinc, it can first be roasted," without, however, giving his reader any idea how to detect such obnoxious elements. In the description of the crucible assay, we note a neat hint by Mr. A. H. Low, of Argo, Colo., when working sulphuret ores. Mr. Brown treats the dry copper assays rather too briefly; but in an appendix gives a good description of the Luckow electrolytic assay, which, after all, with proper precautions, is destined to become the standard method. The chapter on lead ores is good.

In the appendix, Mr. Brown has gathered a number of papers, among them the late Mr. F. A. Lowe's article on metallic scales, a paper by Mr. M. G. Nixon, M.E., on the laboratory mill run, the pan test for gold, the chlorination assay for gold, the assay of gold bullion, base bullion, determination of moisture, etc.

EXTRACTS FROM CHORDAL'S LETTERS. *New and Enlarged Edition, with Additional Plates.* [By JAMES W. SEE, Hamilton, O.] New York: John Wiley & Sons. 1888. 12mo, 396 pages. (*No Index.*)

A new edition of the inimitable letters which "Chordal," Mr. James W. See, has contributed to our vigorous young contemporary, the *American Machinist*, has been issued. We have already dwelt upon the characteristics which have made this work as well one of the most entertaining as one of the most useful works in the library of an engineer or mechanic. Mr. See has watched men and methods with the eyes of a keen observer, and in a humorous garb he has clad a sharp and discriminating criticism of much that needs reform. A man of clear common sense, he has the knack of hitting upon a point of view that is original, and throws a flood of suggestive light on the subject of which he is treating.

CONVERSION TABLES OF METRIC AND BRITISH OR UNITED STATES WEIGHTS AND MEASURES. By ROBERT H. THURSTON. New York: John Wiley & Sons. 8vo, 83 pages.

The title of this little book sufficiently indicates its aims and its scope. It is, so far as we are able to judge, in substance a reprint of an appendix to Professor Thurston's recent work on the Materials of Engineering. The figures are plainly printed, and the arrangement suitable to the purpose.

THE REMOVAL OF AMMONIA FROM CRUDE GAS.

In connection with the many plans now brought forward to utilize the ammonia in the gases escaping from coke-ovens and blast-furnaces, it may be of interest to refer to a process brought out some years ago in connection with illuminating gas manufacture by Messrs. Bolton & Wanklyn, and adapted by them, we understand, to the metallurgical branches also. When bone-ash or any other substance containing phosphate of lime is treated with sulphuric acid, the products formed are superphosphate of lime and hydrated sulphate of lime, this mixture is known as superphosphate of lime in commerce, and is the substance used in this process. This substance is capable of absorbing carbonic acid and ammonia from foul gas. The complete action can only take place in the presence of a certain proportion of carbonic acid, so that the process is not so successful with "well-scrubbed illuminating gas." The superphosphate is converted into carbonate of lime, while the ammonia combines with the phosphoric acid to form phosphate of ammonia; the hydrated sulphate of lime is also acted upon, and forms carbonate of lime and sulphate of ammonia; so that, presuming the action to be complete, and the material to be thoroughly saturated with carbonic acid and ammonia from the foul gas, the result is a mixture of carbonate of lime and phosphate and sulphate of ammonia. Under these circumstances, the mixture absorbs one equivalent of carbonic acid for every four equivalents of ammonia; therefore, if the superphosphate process be substituted for the ordinary washers and scrubbers, a large proportion of the carbonic acid and also the whole of the sulphureted hydrogen is left in the gas, and must be dealt with in other ways. This superphosphate process has been at work at the South Metropolitan Gas-Works, Old Kent Road, for nearly two years. In practice it is usual to water the superphosphate before use with ammoniacal liquor, and it is used in dry purifiers, in layers about eight inches thick. This process has been thoroughly investigated at the Munich Gas-Works, by Drs. Bünte and Schilling, and the report made by these gentlemen proves its practical efficiency, and therefore the question of its advantage, as compared with washing and scrubbing, is based chiefly upon financial considerations. It is evident that in foreign parts, or in any place where there is a difficulty in disposing of the ammonia, the obtaining of the same in a dry form offers several advantages as compared with having it as a weak solution.

THE EARLY HISTORY OF THE STEAM-HAMMER.

An autobiography of James Nasmyth, the great British engineer, has just been published, in which he gives the following account of the manner in which he was led to invent the steam-hammer, with which his name will always be associated, and how it was introduced into practice:

"My connection with the Great Western Railroad Company shortly led to a most important event in connection with my own personal history. It appears that the Great Western steamship had been very successful in her voyages between Bristol and New York; so much so, indeed, that the directors of the company ordered the construction of another vessel of much greater magnitude—the Great Britain. Mr. Francis Humphries, their engineer, came to Patricroft to consult with me as to the machine tools, of unusual size and power, which were required for the construction of the immense engines of the proposed ship, which were to be made on the vertical trunk principle. Very complete works were erected at Bristol for the accommodation of the requisite machinery. The tools were made according to Mr. Humphries's order; they were delivered and fitted to his entire approval, and the construction of the gigantic engines was soon in full progress.

"An unexpected difficulty, however, was encountered with respect to the enormous wrought-iron intermediate paddle-shaft. It was required to be of a size and diameter the like of which had never been forged. Mr. Humphries applied to the largest firms throughout the country for tenders of the price at which they would execute this important part of the work; but to his surprise and dismay, he found that not one of them would undertake so large a forging. In this dilemma, he wrote a letter to me, which I received on November 24th, 1839, informing me of the unlooked-for difficulty. 'I find,' he said, 'that there is not a forge-hammer in England or Scotland powerful enough to forge the intermediate paddle-shaft of the engines for the Great Britain! What am I to do? Do you think I might dare to use cast-iron?'

"This letter immediately set me a-thinking. How was it that the existing hammers were incapable of forging a wrought-iron shaft of thirty inches diameter? Simply because of their want of compass, of range and fall, as well as of their want of power of blow. A few moments' rapid thought satisfied me that it was by our rigidly adhering to the old, traditional form of a smith's hand-hammer—of which the forge and tilt-hammer, although driven by water or steam power, were mere enlarged modifications—that the difficulty had arisen; as, whenever the largest forge-hammer was tilted up to its full hight, its range was so small that, when a piece of work of considerable size was placed on the anvil, the hammer became 'gagged;' so that when the forging required the most powerful blow, it received next to no blow at all, as the clear space for the fall of the hammer was almost entirely occupied by the work on the anvil.

"The obvious remedy was to contrive some method by which a ponderous block of iron should be lifted to a sufficient hight above the object on which it was desired to strike a blow, and then to let the block fall down upon the forging, guiding it in its descent by such simple means as should give the required precision in the percussive action of the falling mass. Following out this idea, I got out my 'scheme-book,' on the pages of which I generally *thought out*, with the aid of pen and pencil, such mechanical adaptations as I had conceived in my mind, and was thereby enabled to render them visible. I then rapidly sketched out my steam-hammer, having it all clearly before me in my mind's eye. In little more than half an hour after receiving Mr. Humphries's letter, narrating his unlooked-for difficulty, I had the whole contrivance, in all its executant details, before me in a page of my scheme-book. The date of this first drawing was November 24th, 1839.

"My steam-hammer, as thus first sketched, consisted of, first, a massive anvil, on which to rest the work; second, a block of iron, constituting the hammer or blow-giving portion; and third, an inverted steam-cylinder, to whose piston-rod the hammer-block was attached. All that was then required to produce a most effective hammer was simply to admit steam of sufficient pressure into the cylinder, so as to act on the under side of the piston, and thus to raise the hammer-block attached to the end of the piston-rod. By a very simple arrangement of a slide-valve, under the control of an attendant, the steam was allowed to escape, and thus permit the massive block of iron rapidly to descend by its own gravity upon the work then upon the anvil.

"Thus, by the more or less rapid manner in which the attendant allowed the steam to enter or escape from the cylinder, any required number or any intensity of blows could be delivered. Their succession might be modified in an instant; the hammer might be arrested and suspended according to the requirements of the work. The workman might thus, as it were, *think in blows*. He might deal them out on to the ponderous glowing mass, and mold or knead it into the desired form as if it were a lump of clay; or pat it with gentle taps, according to his will, or at the desire of the forge-man.

"Rude and rapidly sketched out as it was, this, my first delineation of the steam-hammer, will be found to comprise all the essential elements of the invention. Every detail of the drawing retains to this day the form and arrangement which I gave to it forty-three years ago. I believed that the steam-hammer would prove practically successful; and I looked forward to its general employment in the forging of heavy masses of iron. It is no small gratification to me now, when I look over my rude and hasty first sketch, to find that I hit the mark so exactly, not only in general structure but in the details; and that the invention, as I then conceived it and put it into shape, still retains its form and arrangements intact in the thousands of steam-hammers that are now doing good service in the mechanical arts throughout the civilized world.

"But to return to my correspondence with the Great Western Company. I wrote at once to Mr. Humphries, and sent him a sketch of my proposed steam-hammer. I told him that I felt assured he would now be able to overcome his difficulty, and that the paddle-shaft of the Great Britain might now be forged. Mr. Humphries was delighted with my design. He submitted it to Mr. Brunel, engineer-in-chief of the steamship; to Mr. Guppy, the managing director; and to other persons interested in the undertaking—by all of whom it was heartily approved. I accordingly gave the company permission to communicate my design to such forge proprietors as might feel disposed to erect the steam-hammer, the only condition that I made being that, in the event of its being adopted, I was to be allowed to supply it in accordance with my design.

Digitized by Google

"But the paddle-shaft of the Great Britain was never forged. About that time, the substitution of the screw for the paddle-wheel as a means of propulsion was attracting much attention. The performances of the Archimedes, contrived by Mr. Francis P. Smith, were so satisfactory that Mr. Brunel, after he had made an excursion in that vessel, recommended the directors to adopt the new propelling power. After much discussion, they yielded to his strongly-urged advice. The consequence was, that the great engines which Mr. Humphries had so elaborately designed, and which were far advanced in construction, were given up, to his inexpressible regret and mortification, as he had pinned his highest hopes as a practical engineer on the results of their performance; and, to crown his distress, he was ordered to produce fresh designs of engines specially suited for screw propulsion. Mr. Humphries was a man of the most sensitive and sanguine constitution of mind. The labor and the anxiety which he had already undergone, and perhaps the disappointment of his hopes, proved too much for him, and a brain-fever carried him off after a few days' illness. There was thus, for a time, an end of the steam-hammer required for forging the paddle-shaft of the Great Britain.

"Very bad times for the iron trade and for all mechanical undertakings set in about this time. A wide-spread depression affected all conditions of industry. Although I wrote to the heads of all the great firms, urging the importance of my invention, and forwarding designs of my steam-hammer, I was unable to obtain a single order. It is true they cordially approved of my plan, and were greatly struck by its simplicity, unity, and apparent power; but the substance of their replies was, that they had not sufficient orders to keep the forge-hammers they already possessed in work. They promised, however, that, in the event of trade recovering from its depression, they would probably adopt the new power.

"In the mean time, my invention was taken up in an entirely new and unexpected quarter. I had for some years been supplying foreign customers with self-acting machine tools. The principals of continental manufacturing establishments were accustomed to make frequent visits to England, for the purpose of purchasing various machine tools required for the production of the ponderous as well as the lighter parts of their machinery. We gave our foreign visitors every facility and opportunity for seeing our own tools at work; and they were often so much pleased that, when they came to order one special tool, they ended by ordering many—the machine tools in full activity, thus acting as their most effective advertisements.

"In like manner I freely opened my scheme-book to any foreign visitors. There I let them see the mechanical thoughts that were passing through my mind, reduced to pen-and-ink drawings. I did not hesitate to advocate the advantage of my steam-hammer over every other method of forging heavy masses of iron; and I pointed out the drawing in my scheme-book in confirmation of my views. The book was kept in the office, to be handy for such occasions; and in many cases it was the means of suggesting ideas of machine tools to our customers, and thus led to orders which might not have been obtained without this effective method of prompting them. Among our foreign visitors was M. Schneider, proprietor of the great iron-works at Creusot, in France. We had supplied him with various machine tools; and he was so pleased with their action that, the next time he came to England, he called at our office at Patricroft. M. Bourdon, his mechanical manager, accompanied him.

"I happened to be absent on a journey at the time; but my partner, Mr. Gaskell, was present. After showing them over the works, as an act of courtesy he brought them my scheme-book and allowed them to examine it. He pointed out the drawing of my steam-hammer, and told the purpose for which it was intended. They were impressed with its simplicity and apparent practical utility—so much so that M. Bourdon took careful notes and sketches of the constructive details of the hammer.

"I was informed, on my return, of the visit of MM. Schneider and Bourdon; but the circumstance of their having inspected the designs in my scheme-book, and especially my original design of the steam-hammer, was regarded by my partner as too ordinary and trivial an incident of their visit to be mentioned to me. The exhibition of my mechanical designs to visitors at the foundry was a matter of almost daily occurrence. I was, therefore, in entire ignorance of the fact that these foreign visitors had taken with them to France a copy of the plan and details of my steam-hammer.

"It was not until my visit to France in April, 1842, that the upshot of their visit was brought under my notice in an extraordinary manner. I was requested by M. Bouchier, Minister of Marine, to visit the French dock-yards and arsenals, for the purpose of conferring with the director of each with reference to the supply of various machine tools for the proper equipment of the marine engine factories in connection with the royal dock-yards. In order to render this journey more effective and instructive, I visited most of the French engineering establishments which had been supplied with machine tools by our firm. Among these was, of course, the famous firm of Schneider, whose works at Creusot lay not far out of the way of my return journey. I accordingly made my way thither, and found M. Bourdon at his post, although M. Schneider was absent.

"M. Bourdon received me with much cordiality. As he spoke English with fluency, I was fortunate in finding him present, in order to show me over the works; on entering which, one of the things that particularly struck me was the excellence of a large wrought-iron marine engine single crank, forged with a remarkable degree of exactness in its general form. I observed also that the large eye of the crank had been punched and drifted with extraordinary smoothness and truth. I inquired of M. Bourdon 'how that crank had been forged.' His immediate reply was, '*It was forged by your steam-hammer!*'

"Great was my surprise and pleasure at hearing this statement. I asked him how he had come to be acquainted with my steam-hammer. He then narrated the circumstance of his visit to the Bridgewater Foundry during my absence. He told me of my partner having exhibited to him the original design, and how much he was struck by its simplicity and probable efficiency; that he had taken careful notes and sketches on the spot; that among the first things he did after his return to Creusot was to put in hand the necessary work for the erection of a steam-hammer; and that the results had in all respects realized the high expectations he had formed of it.

"M. Bourdon conducted me to the forge department of the works, that I might, as he said, '*see my own child;*' and there it was, in truth—a thumping child of my brain! Until then it had only existed in my scheme-book; and yet it had often and often been before my mind's eye in full action. On inspecting the steam-hammer, I found that Bourdon had omitted some important details, which had led to a few mishaps, especially with respect to the frequent breaking of the piston-rod at its junction with the hammer-block. He had effected this, in the usual way, by means of a cutter-wedge through the rod; but he told me that it often broke, through the severe jar during the action of the hammer. I sketched for him, then and there, in full size, on a board, the elastic packing under the end of the piston-rod, which acted, as I told him, like the cartilage between the bones of the vertebræ, preventing the destructive effects of violent jars. I also communicated to him a few other important details, which he had missed in his hasty inspection of my design. Indeed, I felt great pleasure in doing so, as I found Bourdon to be a most intelligent mechanic, and thoroughly able to appreciate the practical value of the information I communicated to him. He expressed his obligation to me in the warmest terms, and the alterations which he shortly afterward effected in the steam-hammer, in accordance with my plans, enabled it to accomplish every thing that he could desire.

"I had not yet taken out a patent for the steam-hammer. The reason was this: The cost of the patent, at the time I invented it, was little short of £500, all expenses included. My partner was unwilling to lay out so large a sum upon an invention for which there seemed to be so little demand at that time, and I myself had the whole of my capital embarked in the concern. Besides, the general depression still continued in the iron trade, and we had use for every farthing of money we possessed. I had been warned of the risk I ran by freely exhibiting my original design, as well as by sending drawings of it to those who I thought were most likely to bring the invention into use. But nothing had as yet been done in England. It was left for France, as I have described, to embody my invention in an actual steam-hammer.

"I now became alarmed, and feared lest I should lose the benefits of my invention. As my partner declined to help me, I applied to my brother-in-law, William Bennett. He was a practical engineer, and had expressed himself as highly satisfied with its value. He had also many times cautioned me against 'publishing' its advantages so widely, without having first protected it by a patent. He was, therefore, quite ready to come to my assistance. He helped me with the necessary money, and the invention was placed in a position of safety so far as my interests were concerned. In return for his kindness, I stipulated that the reimbursement of his loan should be a first charge upon any profits arising from the manufacture of the steam-hammer, and also that he should have a share in the profits during the period of the patent rights. Mr. Bennett lived for many years, rejoicing in the results of his kindness to me in the time of my difficulty. I may add that the patent was secured in June, 1842, or less than two months after my return from France.

"Soon after this, the iron trade recovered from its depression. The tide of financial prosperity of the Bridgewater Foundry soon set in, and my partner's sanguine confidence in my ability to raise it to the condition of a thriving and prosperous concern was justified in a most substantial manner. In order to make the most effective demonstration of the powers and capabilities of my steam-hammer, I constructed one of 30 cwt. of hammer-block, with a clear four-foot range of fall. I soon had it set to work, and its energetic services helped us greatly in our smith and forge work. It was admired by all observers. People came from a distance to see it. Mechanics and iron-founders wondered at the new power which had been born. The precision and beauty of its action seemed marvelous. The attendant could, by means of the steam slide-valve level in his hand, transmit his will to the action of the hammer, and thus *think* in blows. The machine combined great power with gentleness. The hammer could be made to give so gentle a blow as to crack the end of an egg placed in a wine-glass on the anvil, while the next blow would shake the parish, or be instantly arrested in its descent midway.

"Hand-gear was the original system introduced in working the hammer. A method of self-acting was afterward added. In 1843, I admitted steam above the piston, to aid gravitation. This was an important improvement. The self-acting arrangement was eventually done away with, and hand-gear again became all but universal. Sir John Anderson, in his admirable 'Report on the Vienna Exhibition of 1873,' says: 'The most remarkable features of the Nasmyth hammers were the almost entire abandonment of the old self-acting motion of the early hammers, and the substitution of new devices, and in the use of hand-gear only in all attempts to show off the working. There is no real saving, as a general rule, by the self-acting arrangement, because one attendant is required in either case; and, on the other hand, there is frequently a positive loss in the effect of the blow. By hand-working, with steam on top of piston, the full force can be more readily maintained until the blow is fully delivered. It is thus more of a 'dead blow' than was formerly the case with the other system.'

"There was no want of orders when the valuable qualities of the steam-hammer came to be seen and experienced. The first order came from Rushton & Eccersley, of Bolton, who, by the way, had seen the first copy of my original design a few years before. The steam-hammer I made for them was more powerful than my own. The hammer-block was of five tons weight, and had a clear fall of five feet. It gave every satisfaction, and the fame of its performances went abroad among the iron-workers. The Low Moor Iron-Works Company followed suit with an order for one of the same size and power; and another came from Hawkes & Co., of Newcastle-upon-Tyne.

"One of the most important uses of the steam-hammer was in forging anchors. Under the old system, anchors—upon the soundness of which the safety of ships so often depends—were forged upon the 'bit by bit' system. The various pieces of an anchor were welded together, but at the parts where the different pieces of iron were welded together flaws often occurred; the parts would break off—blades from the stock, or flukes from the blades—and leave the vessel, which relied upon the security of its anchor, to the risk of the winds and waves. By means of the steam-hammer, these risks were averted. The slag was driven out during the hammering process. The anchor was sound throughout, because it was welded as a whole.

"Those who are technically acquainted with smith-work as it used to be

Digitized by Google

practiced, by what I term the 'bit by bit' system, that is, of building up from many separate parts of iron, afterward welded together into the required form, can appreciate the vast practical value of the 'die' method brought into general use by the controllable but immense power of the steam-hammer. At a very early period of my employment of the steam-hammer, I introduced the system of stamping masses of welded hot iron as if it had been clay, and forcing it into suitable molds or dies placed upon the anvil. This practice had been in use on a small scale in the Birmingham gun-trade. The iron-work of fire-arms was thus stamped into exact form. But until we possessed the wide range and perfectly controllable powers of the steam-hammer, the stamping system was confined to comparatively small portions of forge work. The new power enabled the die and stamp system to be applied to the largest class of forge work; and another era in the working of ponderous masses of smith and forge work commenced, and has rapidly extended until the present time. Without entering into further details, the steam-hammer has advanced the mechanical arts, especially with relation to machinery of the larger class, to an extent that is of incalculable importance.

"Soon after my steam-hammer had exhibited its merits as a powerful and docile agent in percussive force, and shown its applicability to some of the most important branches of iron manufacture, I had the opportunity of securing a patent for it in the United States. This was through the kind agency of my excellent friend and solicitor, the late George Humphreys, of Manchester. Mr. Humphreys was a native of Philadelphia, and the intimate friend of Samuel Vaughan Merrick, founder of the eminent engineering firm of that city. Through his instrumentality, I forwarded to Mr. Merrick all the requisite documents to enable a patent to be secured at the United States Patent-Office, at Washington. I transferred the patent to Mr. Merrick, in order that it might be worked to our mutual advantage. My invention was thus introduced into America under the most favorable auspices. The steam-hammer soon found its way into the principal iron-works of the country. The admirable, straightforward manner in which our American agent conducted the business from first to last will ever command my grateful remembrance."

THE SILVER KING MINE.

By William P. Blake.

History of the Discovery and Location.—The importance of the Silver King mine in the history of mining in the United States, and particularly in the territory of Arizona, lends more than the usual interest to the details of the discovery and location to the vein. The efforts to find the locality and to open up the mine date back into the period when the southwestern and central parts of Arizona were still in possession of the savages, and the history of the mine is closely connected with the development of the region and its settlement by the white man. In fact, the Silver King has been an important if not the leading factor in the reclamation of the Pinal region from the murderous Apaches. These hereditary, marauding savages dominated the whole region, and made it almost inaccessible to the hardy and daring prospectors who began to press outward from the frontier settlements on the Gila River toward its sources in the mountains.

The Pinal Mountains, rising to the eastward of the broad plains of the Gila and Salt rivers, stretch northwestward from the Gila to the higher ranges of the White Mountains, and to the plains of the Great Colorado. This range has many spurs and irregular outlying masses cut by cañons leading down to the Gila Valley, which, by reason of their extreme ruggedness and impassable nature, afforded an excellent refuge and secure hiding-place for the Apaches after marauding expeditions to the plains or the destruction of helpless trains of immigrants. One of the trails most traveled by the Apaches led up the valley of the little creek now known as Queen Creek, and over the nearly vertical face of the mountain, within a stone's throw, almost, of the point where the Silver King mine was afterward discovered. That the vicinity was the favorite resort and hiding-place of the savages is shown, also, by the fact that there are caves in the face of the cliffs overlooking the trail, containing piles of ashes and fragments of Indian pottery.

In the year 1873 (?), when General Stoneman, the accomplished cavalry officer, now Governor of California, was commander of the military department of Arizona, it became necessary to adopt more vigorous measures than had been made for the repression of Apache raids. To this end, General Stoneman moved with his command to the base of the mountains, near to the Apache trail, and established a camp. He then constructed a road or mule-trail diagonally up the face of the mountains leading over into the higher table-lands and valleys of the Pinal Range. This pack-trail, since known as "Stoneman's Grade," is the main traveled route to the mining districts of Globe and Pioneer.

One of the soldiers, named Sullivan, employed in cutting the trail, when returning from his work one evening, sat down to rest on a projecting rock, near the camp, and began picking up loose fragments of rock about him, among which there were some small but heavy, black, metallic-looking lumps. These, instead of breaking up when pounded on the stones, became flattened out, and were evidently metallic, somewhat resembling lead. This attracted his attention, but he did not fully realize the importance of his find. He, however, gathered a few of the lumps and went on to camp without saying any thing about his discovery to his comrades. His term of service expiring soon afterward, he was discharged from the service and made his way to the rancho of Charles G. Mason, on Salt River, near to the place where the town of Phœnix was afterward located. Mr. Mason was one of the very few frontiersmen who braved the terrors of the Apaches and staked out a farm on the fertile bottom-lands of the river. Sullivan remained at the place some time, and frequently showed the black ore (since familiarly known among the miners and prospectors of the region as "nugget silver") to Mr. Mason, but without telling exactly where he had found it. Mr. Mason supposed that he would go back to the place, and he no doubt expected to go with him and participate in the benefits of the discovery; but one day Sullivan suddenly disappeared, and was not heard of for years after. He was supposed to have been killed by the Apaches, or to have perished on the desert, in the attempt, perhaps, to return to the place where he had found the rich silver ore.

The desire to find the place where Sullivan had discovered the "pure stuff," as the rancheros called the black nuggets of silver sulphide, led them to make several attempts to get there. Prospecting parties were formed at intervals for several years to prospect the Pinal Mountains, and these parties were often close upon the spot without knowing it. They even made a location only a mile and a half distant from the place, and called it the Silver Queen. This was the first location made in the region; but no district was then defined by boundaries or organized by the appointment of a recorder. Later, the party extended their searches over the Pinal Mountains into the region now known as Globe District. They made a location there known to this time as the Globe mine, and they gave the name to the district. The next year, 1875, Mr. Mason and one of his neighbors, Benjamin W. Regan, formed a party of five, consisting of themselves, William H. Long, Isaac Copeland, and one man whose name can not now be recalled, to go again to the Globe mine, taking a train of animals to fetch out some of the ore. On their way back, March 21st, 1875, they were attacked by Apaches, and one of their party was killed. His body was taken to Camp Supply, at the summit of the Stoneman Grade, and was buried by his comrades in one of the old stone baking-ovens used for baking bread by Stoneman's soldiers. When the survivors reached the foot of the grade, near to the water and camp-ground, Copeland was sent to break off some of the croppings from projecting rocks at one side of the trail, and fetch them into camp two miles below. He went to the place indicated, and soon after came hurrying into camp shouting, "I have struck it," and "it is good enough for me." The excited and hopeful prospectors gathered around him, and as the pieces of croppings holding the long-sought black silver ore passed from hand to hand, they all said, "It is good enough for us," and concluded that at last they had discovered the place where Sullivan had found the "black stuff," the nugget silver. But they were in no condition to remain at that time to explore the locality or to make their prize more certain and secure. Travel-worn, weary, and saddened by the loss of their comrade, and without provisions, they hastened on to the settlement on the Gila, at Florence, crossing the dreaded desert at night. The next day, jealously guarding their secret, they gathered supplies together and hastened back to the discovery-point. There, sure enough, they found the little black nuggets strewing the surface, and mineral stains, of many colors, including green and blue, in the substance of the rock. The long-sought treasure was found at last. Sullivan's discovery was no longer his alone. Standing upon the highest point of the mineral-stained rock, they made the Silver King location, fifteen hundred feet long in an easterly and westerly direction, and six hundred feet wide in a northerly and southerly direction. This was on the 22d day of March, 1875. It was the initial location of the mining district now known as the Pioneer Mining District. This district was immediately laid out, or designated, as twenty miles square, extending ten miles each way from the initial point of the Silver King location, with the bounding lines running north and south, east and west. This location, and the location of the claim, were properly made in accordance with the laws, and they were duly recorded in the county records at Florence, the county-seat.

The ownership of the location of the Silver King claim was then equally divided between the four survivors of the party of five, each holding one fourth. On the 30th of June, 1876, Isaac Copeland sold his one quarter to Charles G. Mason, and William H. Long sold his one quarter to Benjamin W. Reagan. On the 9th of January, 1877, Charles G. Mason sold his one half to Col. James M. Barney, and on the 5th day of May, 1877, the Silver King Mining Company was incorporated under the laws of the State of California. On the 9th of May, 1877, James M. Barney and Benjamin W. Reagan deeded their entire interests in the mine to the incorporation.

The title to the mine is thus continuous and perfect, and is in accordance with the laws of the United States governing the occupation and working of mineral lands. The mine has been worked continuously, and since the incorporation to the present time, and it promises to be prominent as the leading silver mine of the country for years to come.

One day, two years ago, an aged man came slowly into the thriving settlement at Picket Post, and with great interest wandered about the Silver King mill, where twenty stamps were day and night merrily pounding out silver from the rock. The man was evidently in need of help, and soon went to the office of the company and announced himself as Sullivan, the old soldier, the original discoverer of the vein, and humbly asked for work. Although long before he had been given up as dead, and very few of his old acquaintances survived, he was identified beyond a doubt, and was immediately taken into the company's service by the day. His story, was briefly told, as follows: On leaving Mason's rancho, he crossed the wide deserts to the westward as far as the Great Colorado River, and beyond it into California. Being penniless, he had sustained himself by working as a farm hand in California. Always hoping to obtain sufficient means to return to Arizona and secure the benefits of his discovery, he had labored on year after year, looking vaguely forward, and keeping the secret of the locality to himself, until one day he heard of the discovery of the rich deposit of silver by Mason and others. He was convinced that the place had been found, and that he had lost his chance of making the location for himself. Although without any ownership or right in the location, as made by Mason and his friends, and disappointed in his long-cherished hope, he could not resist a desire to return and see the result of the opening of the mine.

Situation, Accessibility, Climate.—The Silver King mine is situated near the base of the southwestern slope of the Pinal Mountain range in Pinal County, Arizona territory, at an elevation of 3700 feet above the sea. The location overlooks the country to the southward as far as the Mexican line, and westward, the vast plain of the Gila and Salt rivers to Phœnix, and beyond. This plain, now comparatively treeless, sterile, and desert-like, was once the seat of ancient civilization, as shown by the numerous ruins of buildings, and the profusion of fragments of pottery strewing the surface; but there is no evidence that the dwellers of the plain had ever discovered the wealth that lay hidden in the King Mountain.

The road from the mine leads for a few miles down the foot-hills and then over the nearly level plain for about thirty-five miles to Florence, on the Gila River, the county-seat of Pinal County. Beyond this town, the

Digitized by Google

road continues over the plain to Casa Grande station, on the Southern Pacific Railroad of Arizona, nine hundred and thirteen miles from San Francisco. The natural road, now also the county-road, is excellent at all seasons, and the drive from the railroad station can be easily made in eight or nine hours. The mine may be reached from San Francisco in fifty-three hours, or five and a half days from New York, and at all seasons without embarrassment by snow, which renders so many of the important mines of the country comparatively inaccessible in the winter season.

The mill of the company is at the town called Pinal, on Queen Creek, five miles from the mine. Pinal is at an elevation of 2400 feet above tide. It is connected with the mine by a good road, and by telephone. At Pinal, the offices of the Silver King & Florence Telegraph Company give direct telegraphic communication with the Western Union lines.

The climate of the region is salubrious, and is particularly delightful in winter, as severe frosts are unknown. The air is remarkably clear, the days are warm, and the nights are cool and refreshing. In summer, the great heat of the day is tempered by the dryness of the air, which promotes rapid evaporation from the skin, and keeps down the temperature of the body. There is no interference with mining or milling operations, or loss of time due to the climate.

A project for a railroad leading northward from the Southern Pacific Railroad to the Silver King mine, and beyond it, is now under consideration, and in all probability a road will be built in the near future. Such a road would not only make the mine accessible in a shorter time than is now required, but would reduce the cost of freight on machinery and supplies, and afford a cheaper outlet for the ores and bullion. The configuration of the country is especially favorable for railroad construction, particularly as far as the foot-hills ;] for it is nearly all a continuous, level, gravelly plain, without streams or cañons, and requiring little or no grading. (TO BE CONTINUED.)

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

RECENT RULINGS OF THE COMMISSIONER.

By a recent ruling, the claimants of mill-sites are permitted to cut and remove timber thereon for the purpose of constructing mills, reduction-works, tramways, or other accessory required in developing their mining interests. In permitting the removal of timber from a mill-site or tract of non-mineral land, prior to the issuance of a patent therefor, it is strictly forbidden to make such timber an article of sale for private gain or speculation.

The law recognizes two ways by which title to a placer claim may be shown: one by a duly certified abstract; and the other, under the statute of limitations.

A final certificate received at the General Land-Office is made out to John Doe *et al.* The commissioner advises the local offices that *et al.* is altogether too loose and indefinite a basis upon which to issue a mineral patent.

A local attorney asked the commissioner to dismiss an application for patent because no appearance had been entered here on behalf of the party. The commissioner says: Should the motion come properly before me for consideration, I shall require advice as to the rule which makes a failure to employ resident counsel sufficient ground for dismissing an appeal without considering the merits of a case.

Concerning the right to order a hearing, the commissioner considers it proper in the exercise of his discretion to order a hearing upon whatever question of fact arising in a case and at whatever stage of the proceedings he pleases. When entry is made of a mining claim and the money paid for the land, the receiver of the local land-office in which the claim is entered fills out two receipts for the amount paid: one of these is transmitted with the final certificate of entry and the papers and the application for patent to the General Land-Office. The other receipt is given to the purchaser. When patent is issued, it is delivered to the party holding the duplicate receipt, who surrenders the same. An attorney for the owner or any one else holding the duplicate receipt can obtain possession of the patent. Usually this receipt is held by the attorney attending to the business of the claimant.

Application for patent and publication of notice thereof, as required by law, do not exempt a lode claimant from making the annual expenditures thereafter upon his claim. That requirement ceases only after payment of the purchase-money and entry in the local land-office.

"A" filed an application, and due publication was made. He failed to prosecute his claim, and the case rested, when "B" appeared at the local office and made a motion to dismiss the proceedings, in order to make application for patent, basing such motion upon a certificate of subsequent relocation and a decree of court in an action commenced by "B" against "A" to quiet title, which decree was rendered through the default in appearance of "A." The Commissioner of the General Land-Office refused to dismiss "A's" application upon such a showing, holding that the courts had no jurisdiction at that stage of the proceedings; that the question of abandonment after the period of publication prescribed by law is one which must be determined by the Executive Department after an investigation. "B" appealed from this ruling to the secretary, who ordered a hearing to determine the question of abandonment before relocation.

The question of a disputed mining title is always one for judicial investigation, and can in no instance be determined by the General Land-Office.

Application for patent can not be received at a local land-office for a lode claim embracing a portion of the surface ground of a claim for which an application has been previously filed and is still pending; but when an application has been properly refused a filing, the subsequent application for a patent for another lode should be received, although including part of the surface claimed adversely by others.

Where non-mineral lands have been fraudulently entered under the mining laws, disinterested parties may, at any time before patent issue, lay the facts before the General Land-Office, supported by affidavits of reliable persons; and, if sufficient to establish a *prima-facie* case of fraud or illegality, a hearing will be directed to be held by the local land-offices for the purpose of determining the truth of the charges made, and, if substantiated the entry will be canceled.

The rule which forbids the reception of an application for patent to a mining claim which conflicts with a claim embracing a prior pending application is derived from that provision of the statute which prescribes the method of filing adverse claims. Where the statute prescribes one way in which a thing shall be done, it precludes every other. It is easy to see that this rule is a salutary one; for were it otherwise, application after application might be accumulated in the local office all relating to the same land, thus nullifying the law which requires adverse claims to be filed and prosecuted. A suit upon an adverse claim, commenced after the period prescribed by law has expired, does not justify the suspension of proceedings for patent.

Coal lands were never subject to location with Sioux or California University scrip.

FOREST FIRES.

Professor C. S. Sargent, who has charge of the forestry statistics of the census, has presented a paper on forest fires at a meeting of the Massachusetts State Board of Agriculture, from which the following parts have been chosen as particularly interesting by the editor of the *Journal* of the Charcoal Iron-Workers:

The division of the tenth census which has been specially engaged studying the forests of the country has endeavored to gather statistics of the extent and value of the forests burned during the year 1880, and, though the results obtained have not yet been published, there is every reason to believe that the extent of forest fires through the country is infinitely greater than has ever been seriously supposed. In Massachusetts, the amount of property destroyed in this way is naturally shown to be comparatively small; and yet, in the year 1880, some 13,899 acres of land were burned over, the loss being given at over $100,000. In Pennsylvania, where the value of forest property is more appreciated than in Massachusetts, and the lumbering interests are only second to those of Michigan, 685,738 acres are reported burned over during the year, with a loss of over $3,000,000. It is not probable that these statements are exaggerated, and in the case of Pennsylvania they undoubtedly do not represent the actual loss from this cause.

An important fact, which probably very rarely receives due attention, is, that forest fires destroy not only growing wood, but the fertility of the soil itself. In treating of forest fires, we generally consider only the immediate damage and pay little if any attention to the greater loss which the land itself suffers from being burnt over. If only a portion of the trees growing on a tract of land are cut, and a sufficient number is left to protect the soil and produce a supply of seed, the same species will continue to grow almost indefinitely. If, on the other hand, a forest is destroyed by a fire which kills the trees and undergrowth of shrubs and herbs, the same species, except in the case of some of our least valuable trees, rarely spring up again. If a forest of white pine is destroyed by fire, this tree does not spring up again, as it would under proper care, and the land is not covered again with any growth of trees for a considerable period. The fire-weed first makes its appearance. The light seed of this plant is often blown for a long distance, and, falling upon the bare ground, germinates quickly, and finally covers the burnt surface with vegetation. Birds drop the seeds of raspberries and blackberries, which find sufficient nourishment and light for germination. These, as they grow, cover the ground and afford protection to the stones of the little Moreton cherry, dropped by birds also, or to the light seeds of the gray birch, or some of the willows or poplars, which are constantly blowing about, and will germinate anywhere upon any unshaded ground. These are generally the first trees which succeed a fire-swept pine wood. Years, however, elapse before the ground is covered again even with such trees.

The cherries and the birches and poplars are short-lived, and are succeeded by more valuable broad-leaved trees. Squirrels and other animals deposit acorns in the ground, and the wind brings the seeds of maples, ashes, and the valuable birches. Such seeds find protection among the poplars and willows which had sprung up, and, as these die, the more valuable trees get a chance to grow, and gradually occupy the ground. This new forest of hardwood trees, if protected from fire, will occupy the ground for a long time, and the original pine will not appear again until the land, long enriched by an annual deposit of leaves, has been once more stripped of its tree-covering and mellowed by years of cultivation. Such land, nearly all over New England, if freed from the plow or the scythe, and guarded from fire and pasturage, grows up again with pine.

The forest fire, then, which destroyed the pine destroyed as well the capacity of the land to produce a similar crop for a period of from fifty to one hundred years. The damage inflicted upon the land is, of course, not irreparable in a climate like that of New England, where the annual rain-fall is sufficient always to insure a growth of trees of some sort upon undisturbed ground, and sooner or later, in the ordinary workings of nature's laws, forests will succeed each other here; but in some parts of the country, where the rain-fall is so slight that there is a constant and severe struggle between the forest and the plain, and where trees under the most favorable conditions barely exist, a fire not only kills the forest, but it makes any future growth of trees impossible.

There is little inducement to plant or protect and encourage the growth of natural woodlands so long as the condition of public sentiment is such that the authors of forest fires are not held responsible for their acts. It is safer to cut it off for cordwood at the earliest possible moment, and thus reduce the risk of probable loss. Under these circumstances, it is useless to adopt any of the methods of thinning or pruning by which the value of young forest-trees for timber may be vastly improved, or to guard the woods from roaming and destructive cattle. Even in a State like Massachusetts, where the value of all forest products is enormously high, capital will not take the risk of forest culture, although it might be made most profitable under a wiser management.

Not a small part of central and southern New England, no longer profitable for agriculture, is now growing up with white pine, and this, if it can only be protected, will, it is thought, soon exceed in value the net profit upon all the New England farms. In some parts of New England, this second growth of pine has been growing for a considerable time, and has already given rise to large and profitable industries. The value of logs cut in Massachusetts during the census year reached nearly $2,000,000. At least one half of these logs were of second-growth pine. More than

Digitized by Google

100,000,000 feet of second-growth pine were sawed during the same year in Vermont and New Hampshire, and nearly, if not quite, as much more in Maine.

The census investigation showed that in Massachusetts, during the year 1880, 52 forest fires were set by sparks from locomotives; that 40 spread from carelessly burned brush-heaps; that hunters caused 37; that nineteen careless smokers dropped their lighted cigars or burning ashes from their pipes, and so caused disastrous conflagrations. In three instances, the origin of forest fires is ascribed to the burning of charcoal, and in only eight cases to malice. It appears, then, that the railroads are responsible for the greatest number of these fires, and that the remainder may be generally traced to sheer carelessness. As a first step toward checking this evil, railroad corporations should be compelled to provide their locomotives with spark-consumers. Another act is needed to compel the collection and burning during the winter in which the trees are cut of every part of them not carried away. A criminal act is also demanded for the punishment of any who shall maliciously or carelessly set fire to growing wood. On these points, however, it is more important to educate public opinion than to frame or pass laws which will only be enforced when people feel the need of them. A full understanding of the forest question is the best guarantee that woods will be protected and receive the care which, in their economic aspect, if in no other, they deserve.

THE IRON TRADE IN THE NORTHWEST OF GERMANY IN 1882.

German iron-masters possess an association whose aims and methods are very similar to those of kindred bodies in Great Britain and in this country. Germany is the third in the rank of producing countries, and and in some specialties sends important quantities of iron and steel to the United States. Indirectly, the growth of the German iron trade has affected our own, as robbing Great Britain of a valued customer and, in some instances, creating a competition in other markets.

The year 1882 was a dull one in the German iron trade, consumers holding off, and a serious decline in prices was averted only by combination of producers. The latter were assisted in their endeavors by the large contracts for railroad material entered into. An exceptionally good crop also created a demand for merchant shapes and bars, particularly in the eastern section of the country, stocks in speculators' and dealers' hands having run down during the preceding period of inactivity. Another feature of the year was the fact that the pending exceptional increase in the Russian duties on wire and wire-rods led the works interested in that specialty to drive at their utmost capacity, in order to make heavy deliveries previous to the enforcement of the new tariff. This summer activity was lost in the winter, and at the close of the year dullness set in. The production in the northwest of Germany, including the Rhenish Provinces, the Siegen District, Westphalia, and Nassau, but excluding the works on the Moselle and Saar rivers, was as follows:

	1881.	1882.	Increase (+) or Decrease (−)
High-Grade Forge Pig.			
Stock, Jan. 1, tons	24,157	7,545	− 16,612

Bessemer Pig.			
Stock, Jan. 1, tons	6,613	10,971	+ 4,358
Production, "	224,718	414,948	+190,230
Consumption and sales, tons	220,360	413,035	+192,675
Stock, Dec. 31, "	10,971	12,884	+ 1,913
Foundry Pig.			
Stock, Jan. 1, tons	14,735	8,901	− 5,834
Production, "	120,133	113,608	− 6,525
Consumption and sales, tons	125,967	119,598	− 5,969
Stock, Dec. 31, "	8,901	2,911	− 5,990

The total output of Germany in 1882 and 1881 was 3,170,957 and 2,914,009 metric tons, of which this district made 1,435,082 and 1,069,148 tons respectively. The imports and exports of pig-iron in Germany were:

	1882.	1881.	1882.
Imports	282,958	244,601	Inc. 38,357
Exports	186,938	245,496	Dec. 58,558

This decrease in the exports is looked upon as a good sign for the activity in the home markets, while the increase in the imports is considered a proof of the heavy disadvantages which high rates of freight cause the German pig-iron industry to labor under. It is generally assumed that two sevenths of the imports are Bessemer pig, while five sevenths are foundry iron.

In regard to other branches of the German iron and steel trade, the following figures of imports and exports will be of interest:

		1882.	1881.
Old and Scrap	Import	8,048	5,644
	Export	59,315	67,073
Billets and Ingots	Import	683	330
	Export	32,957	40,677
Bars	Import	15,779	14,258
	Export	144,397	152,804
Tires and Plow-shares	Import	38	47
	Export	14,052	15,567
Angles and Tees	Import	199	71
	Export	3,695	4,554
Rails	Import	663	1,495
	Export	186,053	250,708
Track Material	Import	173	297
	Export	11,596	11,981
Axles, Wheels, etc.	Import	239	171
	Export	11,822	17,083
Plates and Sheet	Import	3,156	3,053
	Export	44,204	40,932
Wire Rods	Import	3,480	3,276
	Export	227,415	159,416
Wire Nails	Import	23	32
	Export	23,877	21,710

The most interesting figures to Americans are those relating to wire, of which the Germans are the leading producers in the world. On the first of July, the Russian government raised the duty on wire-rods from 35 kopecks to 1 ruble 10 kopecks per poud, or an increase of 185·77 per cent, and as the Russian wire-mills produce only a portion of the quantity required by wire-drawers and nail-makers, they endeavored to obtain as heavy an amount of the supplies of raw material as possible. The German mills were therefore taxed to their utmost capacity, and the number of trains added to their plant was extraordinary, carrying the total number in the Northwest District, which is the chief producing section, to 51, so that fears are expressed of a danger of overproduction. The Germans are making great efforts to produce barbed wire. Hitherto this class of goods has been made almost exclusively from imported Swedish iron, but now it is made of soft steel hardened. The German makers complain that the duty, which is only one half of one per cent *ad valorem*, is too low to protect them against English competition, and they are clamoring for more. Some of the wire-makers complained that the duty on pig was checking them, and the manufacturers have accordingly, under certain circumstances, put down the price of the raw material for wire made for export. The German wire-makers are besides urging the railroad managers to give them special drawbacks on freights on exported material, and the fact that such concessions have been made on exported rails seems to give them grounds for hoping that they will succeed.

It may be noted that the Siegen spiegeleisen producers are also dissatisfied with the railroad rates, notably on coke and on metal for export.

PROGRESS IN SCIENCE AND THE ARTS.

Electric Torpedo-Boat.—A torpedo-boat has just been satisfactorily tried at Constantinople, in which a Siemens electro-motor drives two screw propellers in the rear of the boat. The vessel is cigar-shaped, and moves under water at the rate of eight knots an hour. Its path is traced in the daytime by a wire which projects above the surface, and is followed by a telescope; in the night, by a lantern having an opening only toward the shore, and a light too feeble to betray itself to the enemy by reflection. The place in which the torpedo-boat was tried furnished a severe test on account of the strong currents, which vary in direction in different parts of the channel, and in strength from one part of the day to another. The wires conveying the explosive discharge are, of course, distinct from those carrying the motive current.

Preventing the Corrosion of Steam-Boilers.—In concluding a valuable paper on steam-raising waters, published in the Journal of the Society of Chemical Industry, Mr. W. Ivison Macadam, F.I.C., says: "Clarke's process, the addition of milk of lime, is suitable; but the space required for settling is against the general adoption of the method. The addition to the feed-water of caustic soda, or, still better, of soda-ash, and at the same time raising the temperature by utilizing waste steam or heat, would be beneficial in most cases, care being taken to afterward settle or filter the water. Soda-ash was first recommended in the columns of the *Times* of March 17th, 1864, by Mr. Peter Spence, of the Manchester Alum-Works, who says: 'For every boiler 2 pounds of soda-ash—an article easily procured at 1½d. per pound—is every day given to the stoker. This he dissolves in a bucketful of cold water, and puts the solution into the water supply for the boilers. This he does as part of his imperative daily duties, and the consequence is, that now not the slightest corrosive action takes place, an additional advantage being that no crust is ever formed in my boiler, all the lime-salt that forms these crusts being also destroyed by the alkaline solution.'"

Paper Doors.—In the use of wood for constructing doors, great difficulty is experienced from the shrinkage, swelling and warping to which the material is subject, while the general use of metal for such purposes is rendered impracticable by its weight. To obviate these objections, a door composed of two or more sheets of paper-board, secured together and rendered homogeneous, has been devised. The following description is furnished by the *Manufacturer and Industrial Gazette:* Boards of properly prepared paper are taken, each having the requisite dimensions for a door, and a thickness of one third or one half the proposed thickness of such door, and within the outer board or boards, openings are cut that correspond in size, shape, and location to the ordinary panel-openings. The edges of these opening are preferably molded, but, if desired, may be left plain and separate moldings may be secured thereon after the door is completed. The outer boards thus constructed are then coated upon their inner faces with a suitable adhesive mixture, preferably composed of forty-nine parts of glue and one and one eighth part of bichromate of potash dissolved in water, and placed upon opposite sides of a central panel board, after which they are passed between rollers and subjected to a heavy pressure, which cause the boards to firmly adhere to and become practically homogeneous. The door may now be covered with any desired fire or water-proof coating, and then painted in the ordinary way, after which it may be hung and trimmed in the usual manner, and from the nature of the material employed is free from all changes which are produced by atmospheric causes upon wood, costs much less than metal, and has less weight even than a door constructed from pine.

Discharging Torpedoes.—It is well known that the problem how best to discharge Whitehead torpedoes presents considerable difficulty, and many attempts have been made to devise a satisfactory mechanism. It appears that Messrs. Yarrow have settled the question so far as torpedo-boats are concerned. Some interesting trials took place at Westminster on the afternoon of the 9th, in the presence of Admiral Sir Cooper Key, First Sea Lord, Rear-Admiral Brandreth, Controller of the Navy, Mr. George Rendel, and Mr. Nathaniel Barnaby, with a second-class torpedo-boat recently built for the English government by Messrs. Yarrow & Co., in order to illustrate the new system of steam impulse introduced by them. The gear is similar to that recently tested at Portsmouth with great success, it being found very superior to the plan previously adopted. The arrangement consists in building two troughs inclined at an angle of 5 degrees in the bow of the boat, which are provided with suitable guides for carrying the Whitehead torpedo. Aft of these

Digitized by Google

troughs or guides are two long steel steam cylinders, 6 inches diameter and 7-foot stroke, the piston-rods of which press against the ends of the torpedoes, and upon steam being suddenly admitted into these cylinders, the torpedoes are instantly forced out with considerable velocity, the speed being estimated at about fifteen miles an hour. If, therefore, the impulse is given when the boat is going twenty miles an hour, the collective speed of the torpedo upon entering the water is clearly thirty-five miles an hour. The arrangement is exceedingly simple, and under the entire control of the steersman.

The Estimation of Sulphureted Hydrogen and Carbonic Acid in Coal-Gas.—Mr. L. T. Wright recommends the following method in a paper read before the British Chemical Society:

The crude coal-gas, dried and freed from ammonia by passing through phosphoric acid, is passed through two weighed U tubes, the first charged with roughly powdered cupric phosphate in one leg and calcium chloride in the other, the second containing soda lime—slightly moistened by exposure to the air for about eighteen hours—and calcium chloride. The increase of weight in the first gives the sulphureted hydrogen in the second the carbonic acid. The copper phosphate is prepared thus: Two pounds of ordinary phosphate of soda are dissolved in one gallon of water, and two and a half pounds of cupric sulphate in one and a half gallons of water. The two solutions are vigorously stirred together, the precipitate washed by decantation, and dried at 100 degrees C. Phosphate thus prepared absorbs hydrogen sulphide very perfectly. Before using the absorption-tubes, three cubic feet of clean dry coal-gas are passed through to "saturate" the reagents. The gas during the absorption should be passed at the rate of ½ to ¼ a cubic foot per hour. The total quantity must vary with the impurity in the gas. The sum of the hydrogen sulphide and carbonic anhydride, thus estimated, is always greater than the number obtained by absorbing these gases simultaneously in one U tube charged with soda lime. A 6-inch U tube charged with cupric phosphate will absorb twenty grains of hydrogen sulphide. A similar sized U tube, charged with soda lime, will absorb perfectly eighteen grains of carbonic anhydride. Dr. Armstrong suggested that some acetylene might be absorbed by the cupric phosphate.

Storage Batteries.—Prof. Henry Morton recently read a paper on the storage of electricity to the members of the New York Electrical Society, at the Stevens Institute of Technology, in Hoboken. Edison incandescent lamps lighted the room, a two horse-power Weston electric motor stood on the lecture-table, and the lamps and motor were furnished with electricity from the Sellon-Volckmar accumulators. Professor Morton briefly described the principles involved in the present methods of electrical storage. He then explained the structure of the Sellon-Volckmar battery, which consists of plates, each made of a fine lattice-work of metallic lead, filled in with a porous mass, which was in each alternate plate either metallic lead or the black peroxide of lead. The experiments made by the lecturer showed that each cell in the battery would yield a continuous current or about thirty-two ampères for nine hours, with an electro-motive force of about two and two tenths volts, a quantity of current sufficient to supply forty-four of the Edison incandescent lamps of 16 candle-power, without employing more than 50 of the cells to secure sufficient electro-motive force to overcome the resistance of the lamps. Each cell weighed only 80 pounds when ready for work, so that for each light of 16 candles, burning one hour, 10 pounds of battery should be provided, if it were used solely as a reservoir to contain the current required. Experiments with the lights in the room were made to show that the battery in many cases would only be required to act as a regulator, simply taking up a temporary excess of the entire amount of electricity used, and providing for a temporary deficiency. By connecting the lights directly with a dynamo, its current was made to fluctuate so that the lights flashed up or faded according as the current was strong or weak. By connecting the dynamo with the battery, so that any excess of current could flow into it, or any deficiency be supplied by it, the lights burned perfectly steady. Touching on the question of using the storage batteries as a means of driving street cars, Professor Morton said that his measurements showed that each battery of 80 pounds weight contained energy equal to about 1,800,000 foot-pounds, or sufficient to take a one-horse car full of passengers across town, or from one end of the city to the other.

The Proportion of Carbon Wasted as Soot.—Prof. W. Chandler Roberts, in his elaborate chemical report for the committee of the Exhibition of Appliances for the Abatement of Smoke, held in London some time since, gives the following evidence on the proportion of carbon wasted as soot. Professor Roberts says: Earlier experiments have indicated the limits within which this proportion of soot will probably be comprised. M. Delezenne estimated in 1855 that the proportion of carbon that escaped combustion in this form might be taken at five per cent of the total weight of fuel burnt in the grate, and that 6320 kilograms of soot fell in twelve hours on the town of Lille. But, as Emile Burnat, quoting Payen, pointed out in a valuable paper on the combustion of smoke in boiler-furnaces, the amount of finely-divided carbon produced in a certain *lamp-black* factory is only 3 per cent of the coal burnt, and therefore the amount of carbon in ordinary smoke must be much lower. In 1858, Mr. John Graham estimated that very black smoke does not contain more than $\frac{1}{10}$ per cent of the carbon of the coal burnt, and the accurate experiments of M. Scheurer-Kestner showed that in boiler-furnaces the loss of carbon in the form of soot never exceeds 1 per cent of the fuel burnt, while the mean loss is probably between ½ and ¾ per cent. A case, however, is recorded, in which a coal containing 69 per cent of carbon (burnt with an inadequate supply of air) thus lost an amount of carbon as soot equal to 2·03 per cent of the fuel burnt. As might be anticipated, the amount of soot is greater in the case of an open fire-place than in a boiler-furnace; but the evidence afforded by the results of the tests made at the exhibition, while possessing much interest, does not, unfortunately, render it possible to give a precise answer to the question, for the following reasons: Some of the soot must have been deposited in the flue before it reached the point at which the withdrawing tube was inserted; and there is reason to fear that in the withdrawal of flue-gas laden with soot through any form of slit or orifice in a tube, the gaseous and solid portions may not enter in exactly the ratio in which they exist in the chimney. In many cases, the flues were carefully swept before and after the trial, and the soot was collected and weighed. In an extreme case, in an open fire-place, no less than 2¼ per cent of soot, compared with the fuel burnt, was found in the flue at the end of the trial. In the case of three close stoves of careful construction, rather less than ¼ per cent was found, while in some cases it fell to ¼ per cent, and in one case to $\frac{1}{10}$ per cent. Of course, these numbers do not include the amount escaping into the air. I may perhaps add that in a preliminary experiment, made with an ordinary open fire-place connected with a chimney by means of a sheet-iron pipe 6 feet long and 9 inches diameter, 17 pounds of bituminous coal were burnt in three hours, and no less than 0·61 per cent of the fuel burnt was collected in the pipe in the form of soot, while the soot that passed into the chimney was not collected. This 0·61 per cent of soot, after drying at 100 degrees C., yielded, on distillation at 300 degrees C., 12 per cent of an oily, strong-smelling mixture of hydrocarbons.

Lubrication.—A subject which does not generally receive the attention it deserves was brought before the members of the Manchester Association of Employers, Foremen, and Draftsmen, at a recent Saturday meeting, in an interesting paper read by Mr. J. Veitch Wilson, on the lubrication of ordinary bearings and of bearings and faces subject to the action of steam. Mr. Wilson dealt with the question in an exhaustive manner. With regard to ordinary bearings under normal atmospheric conditions, he laid down that the lubricants to be employed should possess the following essential properties: They must not give off inflammable vapor under 350 degrees Fahr.; they must not act upon the metals with which they come in contact, nor oxidize, which tended to spontaneous combustion and clogged the machinery; they must have body adapted to the work to be done; their boiling-point must be sufficiently high to prevent evaporation and secure durability, and their freezing-point must be low enough to insure regularity of feed from the oil-cups and convenience in handling. As the result of numerous experiments, he had become convinced that mineral oils were, if used alone, unsatisfactory lubricants; but bearing in mind the fact that mineral oils could now be obtained in every respect as safe as the finest animal oils, and that the admixture of mineral oil with animal or vegetable oils neutralized the acidity in the one case and the acidity and oxidizing tendency in the other, he was of opinion that the safest, most efficient, and most economical lubricants for all manner of bearings were to be found in a judicious mixture of animal or vegetable with good mineral oils. With regard to cylinder lubricants, the peculiar conditions were the liberation of natural acids from vegetable and animal fats by the action of steam and heat, the action of these acids on the cylinders, and the evidence that in these acids were constituent parts of all animal and vegetable fats and oils: they could not be removed by any process of refining. One of the lubricants largely in use was tallow, but that this was the cause of considerable injury to the engine cylinders he had abundant evidence to prove. From the mass of evidence he had collected upon the subject, he was convinced that, if care were exercised in the selection of the oil, and equal care in its preparation and application, hydrocarbon oil would be found thoroughly efficient as a cylinder lubricant, absolutely harmless and much more economical than tallow. Sometimes a small percentage of vegetable or animal matter was added, in order to increase the lubricating properties, and in his experience this had always been attended with favorable results. Hot-air engines might be lubricated on the same principle as steam-cylinders, but gas-engines presented a new and special feature, as in their case the lubricant was not only subjected temporarily to the intense heat of the explosion, but also came in direct contact with the flame, and was liable to be carbonized thereby. If, therefore, vegetable or animal oils and fats were objectionable in steam-cylinders, they were much more so in the cylinders of gas-engines.

THE SLIPPING OF MINE LOCOMOTIVE-WHEELS.—There has been complaint occasionally that mine locomotives give trouble underground, because the wheels are apt to slip, the weight of the engines not being great enough in comparison with the duty they are called upon to perform, because their dimensions are restricted by the size of the drifts and galleries. Besides, escaping steam and smoke make the rails slippery, so that a grade of two per cent is considered a maximum by many. The frequent use of sand-boxes is objectionable, because it tends to destroy the rails more rapidly. In the Mazenay iron mines, the observation was made accidentally that throwing a jet of water upon the rails considerably increases the friction. A condensation water-cock broke accidentally, and a mixture of water and steam flowed on the rails at a point where the grade was 1¼ per cent, and where usually the wheels slipped. No trouble at all was experienced that time, and since then, special cocks have been provided, which are opened when the steep grade is reached, throwing water from the boiler upon the rails. Since the introduction of this simple experiment, there has been no difficulty whatever.

DUST-CHAMBERS FOR BLAST-FURNACES.—In order to avoid the inconvenience attending the cleaning of brick stoves for heating the blast by the waste gases from their iron blast-furnaces, the managers of the new St. Nazaire works, France, have put up dust-chambers. The furnaces, of which there are two, are 19 meters (62·34 feet) high, have a 5-meter (16·4-foot) bosh, and are designed to smelt Spanish and Segré (Anjou) ores with Welsh coke. The velocity of the gases carried from the furnaces to the Whitwell stoves was computed at about 21 feet, so that no chance would be afforded the dust carried along to settle in the flues, and for this purpose large sheet-iron boxes were built, with the object of forcing the gases to travel in thin sheets over long stretches of sheet-iron and settle the dust previous to its entering the stoves. Herr J. H. C. Steffen, in a recent issue of *Stahl und Eisen*, gives the details of the construction of these dust-settlers. In running on Spanish ores to the extent of 80 per cent of the charge, the average quantity of dust gathered per week was 45 cubic feet. On the second furnace, which had not yet been at work at the time when the St. Nazaire establishment was visited by Herr Steffen, a different plan, based upon the idea of diminishing the velocity of the current as much as possible, was to be tried, and accordingly, dust-chambers of a different design were built. As yet, no data as to the merits of the two plans are available.

PROFITS IN THE MANUFACTURE OF DYNAMITE.—The report of the directors of the Nobel Explosive Company, Glasgow, showed a net profit for the year of £58,087 14s., in addition to £9737 1s. 3d. brought forward. The output of the various articles manufactured by the company, and their ultimate conversion into dynamite, blasting gelatine, detonators, and electric fuses, has considerably increased during the year, with the exception of the sulphuric acid, which was slightly decreased, owing to the necessary repairs of chambers. The cost of manufacturing nitro-glycerine was considerably greater than during 1881, owing to a further advance in the price of crude and refined gelatine. But for this, the balance of profit for the year would have been greater. The cost of nitro-cotton, fulminate of mercury, detonators, and electric fuses compares favorably with that of 1881. The demand for the company's manufactures, both at home and abroad, has continued to increase, and has taxed the producing powers of the factories to such an extent that the dynamite and blasting gelatine had to be dispatched from the Ardeer factory more frequently, and in smaller shipments than usual. In order to assist in the more rapid delivery of the explosives, the directors were compelled to charter an extra steamer during the whole of the past year, the expense of which has enhanced the cost of production. For a length of time, it has been evident to the directors that the steadily increasing demand for dynamite and blasting gelatine would soon overtake the company's powers of production, and after obtaining government sanction for the necessary extension of the works, they decided about a year ago to erect a duplicate factory. With this view, it became necessary to acquire more land, and they have now the pleasure of reporting that they have purchased, at a cost of £10,000 sterling, 240 acres of ground from Mr. Patrick Warner, which will give them ample scope for their future operations. This additional factory is now approaching completion.

A CURIOUS CASE OF CORROSION OF STEEL.—Professor Munroe, of the United States Naval Academy, has contributed the following to the *Journal of the Franklin Institute:* Through the kindness of Chief-Engineer Farmer, my attention has recently been called to the appearance of two cold-chisels found in the United States steamship Triana in 1874, and which have since been preserved in the Department of Steam Engineering at the Naval Academy. These chisels were taken from the channel-way leading from the jet-condenser, and were located between the foot-valve and the air-pump. Both chisels were of steel throughout, as was proved by tempering the head. For use, of course, only the points had been tempered. During the time of exposure to the action of the salt water in the channel-way, the chisels were deeply corroded; but the corrosion was confined entirely to the soft metal, the tempered points not being attacked in the least. The corrosion was deepest at the line of contact between the tempered points and the untempered metal of the haft. The line of immersion, on tempering, is as distinctly marked as if drawn with a shading-pen. Since meeting with these chisels, I have heard of a similar case of corrosion, although the object has been lost. It was a hammer which had been taken from the boiler of a merchant vessel, the tempered faces of which were intact, while the soft metal was corroded. Remembering the heated discussion going on in metallurgical circles on the question, What is Steel? I shall not attempt to decide whether the change which takes place in the tempering of steel is a chemical or a physical one; but it is evident that this change produces a body which is not so readily acted upon by salt water as untempered steel is. It is also probable that, when the untempered and tempered steels are brought in contact in the presence of salt water, we have an electro-chemical couple, and that this hastens the destruction of the untempered metal. I beg to suggest that this observation may have a practical bearing upon the construction of steel ships.

ESTIMATING THE CONTENTS OF HIGHLY PLICATED ANTHRACITE COAL-BEDS.—At a meeting of the Engineers' Club of Philadelphia, Mr. Charles A. Ashburner read a paper on a New Method of Estimating the Contents of Highly Plicated Coal-Beds as applied to the Anthracite Coal-Fields of Pennsylvania. The questions of the future production and ultimate exhaustion of these fields are of the greatest importance. In 1860, the population of the United States was 31,443,321, and 8,513,123 tons of coal were produced, that is, actually shipped to market; in 1870, the population had increased 22 per cent (38,558,371) and the production of anthracite was nearly doubled, being 16,182,191 tons. For the year 1880, with a population of over 50 millions, the product was 28,437,242+ tons. In 1882, the actual production was over 30,000,000 tons. It has been variously estimated that the 470 square miles containing this coal in Pennsylvania will be entirely exhausted in from 140 to 204 years. While Mr. Ashburner does not estimate the ultimate exhaustion, he has devised a method for estimating the contents of these fields from data which the careful and practical geological and mining examinations of the State Survey are now affording. The exact position and detailed structural shape of the coal-beds are first mapped by 50-foot contour-lines along the floor of the beds, giving, completely and satisfactorily, their geometrical construction and shape. These surfaces are then developed into planes, by the development into straight lines of the line of the bed as cut by paralleled section planes 1600 feet apart. This graphical method is attended with errors which are mathematically discussed, and which have been formulated by Mr. Arthur Winslow, member of the Club. This method does not give the true area of the surface of a sphere, cone, or triangular trough. In the case of a sphere, it gives $\frac{\pi}{4}$ of the true area; in a cone, the error increases directly as the secant of the angle which the pitch of the cone makes with its axis; and in a triangular trough, which more nearly represents the shape of the anthracite basins, the error is very much less. A practical test has been made of this method in the Panther Creek basin, between Mauch Chunk and Tamaqua, and the maximum possible error in estimating the surface area of the coal-beds was found to be ·905 of 1 per cent. After the areas are thus found, the contents are obtained by careful measurements made in the mines, to ascertain the actual number of tons of coal which are contained in a unit (1 acre) of bed area. In this way, it has been estimated that the above basin originally contained 1,032,000,000± tons; that the area under development originally contained 92,000,000± tons, out of which latter area 54,000,000± tons have been taken.

FURNACE, MILL, AND FACTORY.

The Colorado Smelting Company has broken ground and begun the construction of large smelting-works at Pueblo. The iron work, including furnaces and two large engines, is manufactured at the extensive shops of Hendey & Meyer in Denver. The furnaces are to be of a size larger than has heretofore been used in Western smelting, having twelve tuyeres instead of eight or ten. Mr. Anton Eilers, widely and favorably known among smelting men, is to be metallurgist of the new works.

On the 13th inst., fire caught in the charcoal sheds of the Midland Blast-Furnace Company, at Midland, Mo., from a spark from the furnace, destroying about 100,000 bushels of charcoal and two large sheds. The loss, about $12,000, was covered by insurance, but the incidental loss by enforced stoppage will amount to considerably more. It was only by the most faithful efforts of the employés that the entire furnace property was saved from destruction. President Lee writes to the *Age of Steel* that several men covered themselves with wet blankets, and stood in the face of the fire and worked to save the company's property, while their own household goods, which wives had carried out of houses, were suffering destruction. He distributed $250 among four of the most faithful men, besides paying them enough to cover their own losses. The furnace will be idle for several weeks, until a fresh stock of charcoal can be made.

The employés of the pipe-mill of the Reading Iron Company on April 20th appointed a committee to wait upon the proprietors, to demand the restoration of wages paid previous to last August. The company denied their request. Superintendent Wolf stated that there was not work enough on hand to keep the men employed. The sheet and iron rolling-mills are also idle. The nail factory of the company has been out of operation for two years. The furnaces, foundry, and forge are running full blast.

Contracts for the construction of eight vessels have been secured by the American Ship-Builders of Philadelphia. Four hundred Edison electric lights will enable work to be carried on at night as well as day. Four hundred men are at present employed. A 140 horse-power engine is 22-inch cylinder and 48-inch stroke. The keel of ship No. 1 will be begun on Monday, and there is yard room for ten in all. The machinery was started up on Thursday of this week.

G. S. Wormer & Sons, of Chicago, are building for the Marinette Iron-Works Company, of Florence, Wis., one 30 and one 25 horse-power portable boiler and a double 6¼ by 8 friction-drum hoisting-engine; for the Lumberman's Mining Company, Iron Mountain, Mich., a 54 by 16 tubular boiler and fixtures complete; for James A. Allen, Fort Howard, Wis., one friction-drum hoisting-engine and boiler; for the Metropolitan Iron and Land Company, Metropolitan, Mich., double-cylinder 10 by 12 friction-drum mining-engine.

The Webster, Camp & Lane Company, of Akron, O., has recently shipped to the Cleveland Iron Mining Company, at Ishpeming, Mich., a hoisting-plant consisting of four drums 8 feet in diameter with face surface sufficient to coil 1300 feet of rope. The drums are to be operated by a pair of engines 22 by 42 inches, and will have a hoisting capacity of 140 tons. This company has also recently furnished the Iron Mountain Mining Company, of Iron Mountain, Mo., a hoisting-plant consisting of two 5-foot drums and one 8 by 32-inch engine, and is now constructing a plant of four 8-foot drums for the Lake Superior Iron Mining Company, and also several different hoisting apparatus, some to go Colorado and some to Montana.

The Buckeye Bridge and Boiler-Works, in Cleveland, O., have several heavy contracts for boilers, and are making 1¾ miles of boiler-iron tubing for compressed air, for a mining company in the Lake Superior region.

The Lake Shore Tube-Works Company, of Pittsburg, was chartered recently, with a capital stock of $25,000, divided into 250 shares of $100 each, and held by the following persons: William L. Hurd, McKeesport, 25; Peter Patterson, McKeesport, 10; James B. Murray, McKeesport, 10; J. M. Converse, Pittsburg, 50; James B. Converse, Pittsburg, 50; James H. Flager, trustee, New York City, 105.

Robert Hogsett is now sole owner of the Lemont Furnace, in Fayette County, Pa., having purchased the half-interest of his partners. The consideration is not known.

The mechanical puddler which recently gave the Phœnix Iron Company so trouble made four heats last week, and did the work admirably, so far as the puddler is concerned; but it is now found that the engine for drawing it is too light for the work, and that the furnace will not melt the iron fast enough to supply the molten iron to keep one of the puddlers in operation. It was thought it would be ample for two of them. These defects will be remedied, another furnace will be built, and a new and larger engine substituted for the one now in use.

The Monongahela Manufacturing Company, Monongahela City, Pa., was reorganized January 1st, 1883, and the capacity of the works was largely increased by putting in new machinery. It is also still adding to its extensive works. It manufactures steam-engines, hoisting machinery, and general supplies for coal mines; pit-cars, pit car-wheels, frogs, and turn-outs; sheaves, drums, etc.; and complete outfits for tipples. Mr. Kelly, the president of the company, was for a long time with the Pittsburg Locomotive-Works, and with A. Garrison & Co. Mr. T. H. Pollock has had charge of these works for over seven years. Previous to this time, Mr. Kelly was superintendent of Witherow & Gordon's works, at New Castle, Pa.

Stack No. 2 of the Franklin Iron Manufacturing Company, Oneida County, N. Y., was blown out for repairs March 23d, after a successful blast of three years and three months. The repairs in progress include raising the stack from 54 to 70 feet, the erection of regenerative stoves, 18 by 60 feet, under the supervision of John M. Hartman, and erecting two blowing-engines, 84 and 40 inches by 4½-foot stroke, made by the Cuyahoga Works, Cleveland, Ohio. No. 1 furnace is in operation, making 300 tons foundry iron per week.

Recently, a large spur-wheel for an engine was cast at the steel-works of the Cambria Iron Company, in Johnstown, Pa. The mammoth ladle contained upward of 20 tons of molten steel, 15 tons of which were poured without the slightest trouble.

The Lehigh Car Manufacturing Company, at Stemton, Pa., whose shops have been idle several weeks for want of orders, has contracted with the Lehigh Coal and Navigation Company for building 500 coal-cars.

The Lochiel rolling-mill property, at Harrisburg, has been sold to Senator Don Cameron for $100,000. It is said that the purchase was made for the Harrisburg & Western Railroad, on which to establish the shops of the company. The furnace was not included in the sale.

GENERAL MINING NEWS.

CALIFORNIA.

INYO COUNTY—BEVERIDGE DISTRICT.

The Inyo *Independent* gives the following items:

A large number of the men are at work on the different mines getting out ore. Two mills are running constantly, and it is said that there is enough ore in sight to keep them running all summer.

SWANSEA DISTRICT.

A number of men are busy in this district, prospecting and developing claims for smelting ores. The large number of fine prospects already located and partly opened, and the probability that first-class smelting-works will soon be erected on the lake, have given an impetus to mining in that section.

BROWN MONSTER AND HERSCH MINES.—These mines are situated in the Inyos,

Digitized by Google

nine miles from Independence. The ore carries gold and silver. The mill has 30 stamps, in six batteries, and the cost of running them by water-power is very small. The Brown Monster is opened by an incline shaft to a depth of nearly 500 feet, and shows a large blue and regular vein of quartz its entire length. The Hersch mine has not been prospected to the extent of the former mine, there being about 100 feet of shaft and tunnel openings; but as far as can be seen, it shows a vein of great strength, with a width of four feet, and all pay-ore. The Hersch ore is of the same general character as the Brown Monster. The situation of these two mines in relation to each other is such that they should be worked and operated by one company.

MONO COUNTY—BODIE DISTRICT.

Work at the different mines continues as usual, and there is no change to report.

PLUMAS COUNTY—GREENVILLE DISTRICT.

CRESCENT.—The mill is running regularly.

TAYLOR-PLUMAS.—A very marked and most favorable change has lately occurred in the face of the main tunnel; all the way in, the ground had been exceedingly hard and difficult to work, but lately the character suddenly changed; the ground has become soft, and most of it can be worked with the pick. As was to be expected, when softer ground was entered, the ledge-matter widened out; in the hardest ground there were places where the ledge was not much over one foot wide; now it is about five feet wide; this is not all solid ore, but consists partly of stringers, with soft dirt between.

CANADA.

PHOSPHATE MINES.—According to the Montreal *Herald*, the operations in phosphate mines in Ottawa County promise to be carried on extensively during the coming summer. One of the new companies which is preparing to operate is the Union Phosphate Mining and Land Company. This company has purchased the Preston property.

Mr. J. H. Dwyer has sold his phosphate mine in Templeton to an American company for $60,000.

About 8000 tons of high-grade phosphate are at present at the Buckingham station of the Canadian Pacific Railroad, Ottawa; also at the Windsor wharf, awaiting shipment. This quantity was drawn by sleigh from the mine on the Du Lievre during the past winter. Two thousand two hundred tons have been taken within the past six months from Mr. B. W. Murray's mine, and deposited at the station.

MANITOBA.

The Manitoba *Mining Index* says:

ARGYLE.—The machinery is working well; about twelve tons per day are put through. The run, so far, has shown a result of about $40 per ton.

LAKE WINNIPEG.—The shaft is driven as rapidly as it is possible for day and night shifts to push the work. No difficulty is experienced from the flow of water, there being just enough coming in to answer for drilling purposes. About sixty tons of ore have already been taken out.

NOVA SCOTIA—SHERBROKE DISTRICT.

The Pactolus Gold Mining Company, of Nova Scotia, which has recently been working on a belt of low-grade ore yielding about $4 per ton at the 95-foot level, started a cross-cut north, and, at a distance of ten feet from the belt, struck a twenty-inch lode hitherto entirely unknown, and made a rich strike therein. Two tons of the ore gave $1248 gold; $80 was taken out of one pound of ore; $600 was taken out of six pounds; $540 was taken out of nine pounds, besides specimens valued at $200 being retained; making in all $2668 from two tons of ore. This strike has created the greatest excitement not only in this district, but is attracting general attention to Nova Scotia mines. It may be added that on this same property the deepest workings have been attained of any mine in Nova Scotia, a single vein having been worked down to a depth of 800 feet.

COLORADO.

HOOSAC.—The annual meeting of the Hoosac Mining and Milling Company was held at Boston recently, the following directors being elected: George S. Merrill, of Lawrence; Cyrus S. Haldeman, of Boston; Cyrus N. Pratt, of New York; Henry B. Pierce, of Boston; Thomas B. Bryam, of Colorado; V. V. Vanderburg, of Colorado; Alfred S. Potter, of Providence; and George E. Curtis, of New York. The statement of General Manager Vanderburgh for the year ended February 28th showed the following:

DISBURSEMENTS.

Labor	$26,880.84
Expenses	4,508.51
Property	5,094.35
Total	$36,483.70

RECEIPTS.

Drafts	$15,804.86
Sales of ore	18,034.27
Balance on hand last annual report	80.79
Balance due managing director	$2,563.78

The above balance was canceled during the early part of the present month through the sale of ore on hand, amounting to $3080.70. The Little Mattie mine has paid expenses since last July, four men on mineral paying the expenses and labor of 24 men on development. One hundred and thirty-two tons of mineral of all grades, sold to date, have netted $136.63 per ton. In the Little Mattie, there have been completed and substantially timbered 456 feet of levels 6½ by 5 feet, 275 feet of shaft 12 by 8 feet, and 104 feet of stopes—in all, 835 lineal feet. There was expended upon the Hoosac mine the past year $6777.07. The March sales of ore amounted to $4011.37. The output in March averaged over one ton of assorted ore per day.

ARAPAHOE COUNTY.

BOSTON & COLORADO SMELTING-WORKS.—It is reported that the capital of this company is to be increased from $1,000,000 to $2,000,000.

BOULDER COUNTY.

The news from the different mines around Jamestown continues to be favorable. The Nil Desperandum is giving good indications. Work on the White Rock is pushed and good ore is produced. The Buckhorn and the Golden King mines are both shipping ore from which the returns are very satisfactory. The Invincible holds its own, and is visited daily by curious investigators.

CHAFFEE COUNTY.

BRISTOL.—This mine has lately been leased. The vein is a large and well-defined fissure, and shows an eight-foot breast of mineral which mill-runs sixty-three ounces in silver and ten per cent lead. The lessees have begun operations, and are putting the mine in order, and shipping will be commenced next week. It is not settled as yet where the ore will be shipped, but it will probably go to Cañon City.

NILES-AUGUSTA.—Later developments and returns from assays show the strike of iron ore to be of considerable importance. The first specimens, which are inferior to the mineral now in the breast of the workings, returned thirteen and a half ounces in silver and 35·4 per cent iron. Assays were not made for lead, although the iron carries a small percentage of it. This same body has been tapped from the other side, and shows a continuous body over seventy feet in extent. The maximum thickness of the ore is not known, but the entire face of the present drift is in mineral. There is a body of mineral overlying this iron, the extent of which is not known, which carries thirty-four ounces in silver and forty-one per cent in lead.

ONLY CHANCE.—This mine has been shipping on an average from twelve to sixteen tons per day of mineral which averages about thirty ounces in silver and fifty-five per cent lead per ton. A large body of ore has just been opened in the workings, and the connection has been completed to the shaft, which will admit of larger shipments from this time on.

MASCOT.—The mine consists of two tunnels and the discovery-shaft. The tunnels are about 80 or 90 feet in depth. The owners have been confining themselves to development-work, and a great portion of the rich ore still remains untouched.

GILPIN COUNTY.

The new discoveries of silver mines in this county, says a dispatch to the Denver *Tribune*, are proving a surprise to the oldest and best miners. Sears & Morris are getting out some fine-looking silver glance from their new mine just opened up in Silver Gulch, east of Black Hawk. They have an eighteen-inch crevice. The Specie Payment, in Virginia Cañon, has been leased and bonded for $75,000, with a paid-up working capital of $10,000, and will begin operations at once. The Champion lode, in the same cañon, now in the hands of an English company, is shipping two and a half cords per day.

JEFFERSON COUNTY.

MINERS' SMELTING AND REDUCTION COMPANY.—The company is running its works at Golden at their fullest capacity night and day, and will probably have to build a large addition to the already extensive works, in order to treat the large quantity of ore. The company is at present working a force of sixty men.

LAKE COUNTY.

Late Leadville exchanges contain the following:

BRADSHAW TUNNEL.—One of the most extensive pieces of prospecting upon Printer Boy Hill is this tunnel upon the north side in California Gulch. The tunnel has been run in a distance of 720 feet, and the intention is to push it about 200 feet farther, with the object of catching the contact disclosed in the Nellie S. In the Lincoln drift of the tunnel, small streaks of mineral have been discovered which were worked and reduced at the Oro stamp-mill It carried about four ounces in gold and a small amount of silver.

CLIMAX.—The Montana shaft is showing some rich mineral. About thirty-five tons of ore are shipped daily, carrying on an average over 100 ounces of silver per ton.

CLONTARF.—This property has now got its water under control and about 300 gallons are taken out per minute. A drift has been run at the bottom of the shaft which is 24 feet lower than the ore-body which was cut recently. The ore-body varies between eight and ten feet thick, and runs about seventy per cent in lead and from twelve to eighteen ounces in silver. Shipping ore will commence shortly.

LITTLE SLIVER.—The suit of Bradford *et al. against* H. S. Kearney, representing the lessees of the Little Sliver mine, being an application for an injunction to restrain the lessees from taking out any more ore from the mine, has been dismissed by Judge Hallett, on the ground that no valid reasons were shown why such an injunction should be granted. The petition alleged that the lessees had extracted more ore from the mine than had been accounted for, but failed to show even presumptive evidence that such was the case. The applicants for the injunction represent a one-ninth interest in the property.

POCAHONTAS.—Among the properties which are started up by lessees, this mine, adjoining the Weldon, on Carbonate Hill, is not the least promising. An engine is now in place over the shaft, and work has been actively commenced. The shaft is 270 feet deep, and there is about fifty feet of water in it. The lessees will first endeavor to handle the water by the present facilities, and if not successful will run a drift above it. There is now a fine body of iron contact exposed in the bottom of the shaft.

WELDON.—This property is situated between the Pendery and Pocahontas, and the location is regarded as most desirable. For some weeks past, it has been working in an eight-foot breast of iron ore, which ran from thirty to fifty dollars per ton. A strike of rich ore was made recently. The force of miners will be increased at once, and work will be pushed vigorously.

SUMMIT COUNTY.

CHAMPION.—The property is now worked under a lease. The principal workings at present lie about two hundred feet above the Robinson, and the ore which is hoisted will average about 100 ounces of silver and 40 per cent in lead. On the dump may be seen over 75 tons of mineral, which will be shipped for reduction.

ROBINSON.—About thirty tons of ore are shipped daily, which is extracted from the various levels running from the sixth to the twelfth, which, it is said, carries about forty ounces in silver and a small percentage of lead, and which is treated at the Argo works.

DAKOTA.

CHEYENNE.—A dispatch to the New York *Tribune* says that the affairs of this company, which have been in a wretched muddle for years, have been adjusted, and a mill is to be erected as soon as one can be shipped. It is understood that the mill is to be one of eighty stamps. Much development-work should be performed on this property before great expense is incurred in procuring reduction-works.

FATHER DE SMET.—The superintendent's report from April 8th to April 15th shows ore extracted from first, second, and third levels, 2090 tons. Ore milled, 2040 tons. North end tunnel in 869 feet. Golden Gate north header in 76 feet. Cook's west cross-cut in 50 feet. In Cook's west cross-cut, have struck a good body of ore. Will cut out a chamber.

ORO FINO.—A contract has been awarded for the erection of hoisting-works at this mine and putting in many improvements, including a Gates crusher, feeders, pumps, etc., the whole to cost $12,000. It is the intention to have the work completed by July 1st, when the mill will resume operations. In the mean time, no work will be done by the company at the mine.

PHANTOM.—It is reported that negotiations have been concluded with an English syndicate whereby the latter will erect two 120-stamp mills upon this group of mines on Box Elder. This group consists of eight contiguous locations in a district (Greenwood) of which little is known even at this near-by point. The property has been quietly and thoroughly developed by a system of open cuts, shafts, and tunnels, and discloses a large body of crystallized ore showing much free gold and milling far above the average Black Hills production. The success of the Phantom scheme will insure the opening of a large and comparatively unexplored district.

SITTING BULL.—Work is advancing satisfactorily on the enlargement of the mill, and will no doubt be ended by the 1st of May.

GEORGIA.

BARLOW.—The open cut at this mine, says the Dahlonega *Signal*, is the largest one in the district, and, in fact, in the State. It is from 400 to 600 feet wide, and nearly one fifth of a mile long.

CONSOLIDATED GOLD MINING COMPANY OF GEORGIA.—The Ivey mill is running regularly on ore from the Ivey cut. The yield is uniform. The ditch that has been so very troublesome now affords a considerable head, and is expected soon to come up to expectations. The 60-stamp mill will be ready for operation some time during the summer.

SINGLETON.—Twenty-five stamps are now running on ore taken from the large stope on Findley Ridge. The company's water-power twenty-stamp mill is one of the most complete in the district. The canal that conveys the water from Yahoola River to the mill is about 700 feet long.

MAINE.

DOUGLASS.—At a meeting held recently, it was decided to purchase immediately two calcining furnaces similar to those in use at the Orford Nickel and

Digitized by Google

Copper Company's work at Bergen Point, N. J. The information from the mine is of a cheering nature; the furnaces are working well, the mine is showing up large quantities of ore of an excellent grade, and preparations are making to conduct operations on a large scale with the intention of turning out thirty tons of ingot copper per month.

FANEUIL HALL.—The Hancock *Bulletin* states that the order for the removal of this company's machinery from Sullivan has been countermanded, and a full crew is at work putting things in shape again.

MANHATTAN.—Work has been resumed.

MEXICO.

A dispatch to the New York *Tribune* says that one of the largest sales of Mexican lands ever made has just been made to a London syndicate. The estate sold is known as the Bustamente tract, and comprises a million acres in Zacatecas. The price paid was $2,500,000.

PACHUCA DISTRICT.

A correspondent of the Mexican *Financier* says that the San Ignacio mine continues in rich ore, and really is the only important mining work now doing by the Real del Monte Company. A large amount of paving stone, etc., has been ordered for the Sanchez reduction-works, as a bed for the patio process. The ores will be ground by arrastras, run by animal power, and the poor people of the vicinity are rejoiced at even this additional prospect of work. They earnestly hope that the opening of these new works by the company will not cause them to close some of their other reduction-works; but unless work be soon resumed in the mines, the supply of ore will not be enough to keep all the works running, especially as the company will lose the Santa Gertrudis ores as soon as the latter company completes its reduction-works of Gaudalupe and Progreso. These ores have always paid large profits to the old company which has until now worked them.

The prospects of the Santa Gertrudis continue good, and twice the present amount of ore could be extracted easily. There have been lively times at the recent meetings of the stockholders. A committee has lately been appointed to examine the books, inspect all parts of the mine, make its own assays, and visit the reduction-works regularly.

The Pachuca River Company has erected part of its machinery and buildings, and has begun to transport the tailings for concentration. Much of the machinery has not arrived. The lawsuit between the claimants of the Rosario Viejo mine and some of the chiefs of this company, for the possession of the mine claimed to have been forcibly taken from the above claimants, continues, and promises to be a bitter struggle.

The engine at the Acosta mine of Real del Monte will be removed to the San Pedro mine of Pachuca. La Estrella and Alta Gracia mines have struck a good body of ore. At the Rosario, the water has been lowered 25 feet, and a lode of rich ore has been uncovered.

The work on the reduction-works of San Antonio Huasca is nearly completed, and ores will be treated there very shortly. Work has been resumed on various other mines in the district.

MICHIGAN.

The plumbago deposit developing near Humboldt is improving steadily, and gives much encouragement to the owner. The deposit has been cross-cut a distance of 60 feet, and sunk upon 25 feet. It is at yet slightly siliceous, but shows less of this detrimental mineral as greater depth is attained. The shaft will be continued to a depth of 60 feet.

ROPES.—The work of sinking the Curry shaft has been interfered with during the past week by an abundance of water. A pump will be put in at once. The management is desirous that sinking shall progress as rapidly as possible, so that a large stoping face may be had by the time the mill is ready to treat the rock. About 70 tons of fine quartz are now on the dump. The treatment of several tons of the rock of this mine, made in New York recently, proved that 60 per cent of the gold was saved on the plates alone. Concentrator, riffles, and arrastra will be added to the mill. The location is most advantageous for cheap treatment of the rock; a brook of sufficient size to furnish water flows within a few yards of the mine; there is an abundance of timber growing on the lands of the company; the fall from the site of the mill is fitted by nature; and labor can be procured at one half the cost that Western companies have to pay for it.

MONTANA.

MARYSVILLE DISTRICT.

DRUM LUMMON.—It has been decided to erect a sixty-stamp mill. The old mill, which has been running several years with good results, will be refitted and used to make test runs on the several qualities of ore which may be discovered in the mine, in order to demonstrate the grade of its milling character.

SUMMIT VALLEY DISTRICT.

ALICE.—The latest strike was on the surface of the south vein between the Magna Charta and the Valdemere, about midway between the two shafts. Developments already made across the vein show it to be seven feet wide, and an average assay yields 80 ounces of silver per ton; it has not been assayed for gold. The ore from this important development is extracted and hauled to the mills on wagons. In the Alice proper, the strike recently reported in the 100 has now been developed a distance of 270 feet horizontally, the entire distance being in pay-ore. The same vein has been struck in the 200, running east, south of the shaft, where the face of the drift is in pay-ore of the same grade and quality as the pay-chute developed in the 100.

BELL.—The smelter started up April 14th. There is ore on hand for a sixty-day run; and by the time the ore now at the smelter is exhausted, it is expected the mine will be in shape to furnish a future supply. Until that time, but one stack will be run. At the mine, work is progressing favorably in the new three-compartment shaft, which has reached a depth of 188 feet. Softer ground has been struck, and progress will be more rapid in the future. A north drift will be run from the 300 as soon as that depth is reached, which will be connected with the old workings in the 240 west drift, by an uprise. This plan will enable the company to begin hoisting the high-grade copper-silver ore from the old workings, before the supply on the smelter dump is exhausted.

SHONBAR.—The last mill-run averaged $160 net to the ton.

NEVADA.

BERRYMAN TUNNEL AND MINING COMPANY.—Work upon the tunnel was commenced some time ago. An open cut was run a short distance, beginning at a point in the quartzite about 75 feet down the hill below the contact of it and the ore-bearing lime-rock. There is a good wagon-road to within a few feet of the tunnel, and no difficulty will be experienced in getting supplies to it. As was anticipated of the formation, it is peculiarly easy to work.

NYE COUNTY.

A correspondent of the Eureka *Sentinel* says: At Hot Creek, the Philadelphia Company is doing but little beyond assessment-work. The Mountain View Company possessed but little perception, as was proved by its management. It erected the old Lemon mill, formerly of Eureka, near the mine, regardless of the necessity of a bountiful supply of water for milling purposes. The diminutive spring near which it located proved inadequate to the requirements, and, as a result, the works were closed and the men discharged unpaid. It is difficult to determine whether the Mountain View mine is valuable or not. Reports about it conflict greatly. Some contend that it has plenty of good ore in sight, while others assert the contrary.

The Rattlesnake has a promising future before it. It appears to be situated on the same mineral belt as Morey, Hot Creek, and Tybo. The chief mines are the Sedan, Louisa, and Oliver Twist. The Sedan is down over 100 feet, with levels showing a well-defined ledge of good average ore.

If it were not for the fact that eight or ten men are working in the 2 G mine, the Tybo camp would be absolutely and completely defunct. The men above mentioned are taking out considerable fair ore on contracts, and will have sufficient on the dumps to start up the mill before long.

In a mining sense, Belmont is dull, though hopes are entertained of its soon becoming otherwise. The Belmont Company is speaking of starting up the works on an extensive scale shortly. Rich ore was recently encountered in one of the mines, making the prospects brighter than they have been for a long time past. Work is still prosecuted in Spanish belt, 11 miles distant from Belmont, by the Barcelona Company. A long tunnel is driven ahead without delay.

NEW MEXICO.

The Southwest *Sentinel* states that an English syndicate has bought the entire property of the Queen City Company and of the Valverde Mining and Smelting Company and sixty other mines, covering in all nine square miles of mineral land. This sale is one of the most important that has occurred in New Mexico for many months, the actual price paid being $1,500,000 in cash. The English company has reserved $1,000,000 for a working capital to open and develop the mines and to extend and enlarge the reduction-works already erected. The properties transferred are extensive and of great value.

ILLINOIS.—The grading for the company's smelter at Copper City is nearly completed. According to the manager's statements, the company can take out one hundred tons of ore per day from the Eureka mine, and if this smelter which is now erecting works successfully, it will put up four more. The machinery for the smelter has arrived, and it will be in working order in thirty days. Hauling ore to the bins constructed for that purpose will be commenced at once, and by the time the smelter is completed four or five hundred tons will be on the ground.

SAN JOSE.—One furnace of a capacity of thirty tons has been erected by this company, which will be in running order very shortly. The purchase of ore and supplies has already begun.

OREGON.

EASTERN OREGON.—We have the following letter concerning this property, dated April 6th:

The Monumental Gold and Silver Mining Company, now known as the Eastern Oregon, was incorporated in this State, and commenced operating on the Monumental mine in 1876. After developing the mine to the depth of 250 feet, the company erected in 1879 a first-class ten-stamp dry-crushing silver mill, which began reducing ore in December of that year. The mill continued to run at intervals during 1880 and part of the spring of 1881, when it fully closed down, the company having utterly exhausted every available pound of ore in the mine, contracted an indebtedness of sixty-five thousand dollars, which still hangs over it in the shape of a mortgage, and victimized every one who was foolish enough to invest in any of its 500,000 shares. An examination of the mine and of the records of the clerk's office of Grant County will verify the above statements.

F. E. C.

PENNSYLVANIA.

A dispatch says that great excitement prevails at Myerstown, Lebanon County, owing to a supposed discovery of a gold vein. Farmers have given up their business and begun digging on their premises. Kreitzer & Co., of Philadelphia, have equipped a mine with a sixty horse-power engine and a furnace for smelting ore, and are making daily shipments of quartz to Philadelphia. Over $6000 have already been spent in experimenting.

SPAIN.

THARSIS-SULPHUR AND COPPER COMPANY.—This company owns mineral properties in Spain, and in 1878 effected a fusion with the Huelva (French) Copper Company, by which the mines, property, and assets of that company were acquired by the purchase of the capital shares, and the exchange of the Jouissance shares for shares of the Tharsis Company. Of the capital shares, 401 (representing £4185) remained unredeemed on December 31st, 1881, and of the Jouissance shares there were 1116 outstanding. In 1881, a scheme was prepared by the directors by which the capital of the company was to be reduced from £1,236,660, divided into 123,666 shares of £10 each (91,896 fully paid up, 31,100 with £7 paid up, and 670 unissued), to £1,174,460, divided into 117,446 shares of £10 each, such reduction being effected by reducing the liability on each of the 31,100 shares after £1 has been called and paid up thereon to the extent of £2 per share, and exchanging four paid-up shares of £10 each for five shares £8 paid of these 31,100 shares. The capital of the company is then to be increased to £1,250,000, divided into 125,000 shares of £10 each, by the creation of 7554 new shares. These, along with the 670 shares hitherto unissued, are to be sold at the discretion of the directors. The funds realized from the call on the 31,100 shares and from the issue and disposal of the 8224 shares are to be applied in paying of the debenture debt of the company. This scheme was adopted by the shareholders by resolutions passed on November 24th, 1881, and confirmed on December 9th, 1881, but it has not yet been effected. The call of £1 per share on the £7 paid shares has, however, been made for January 2d, 1883, and it is believed that the exchange of these £8 paid shares for fully paid-up £10 shares will take place shortly after. Accounts are now made up annually to December 31st and submitted at Glasgow in April. According to the report and accounts for the 10 months to December 31st, 1881, after the payment of the dividends, writing £20,000 off the mines in Spain, and adding £20,000 to the reserve fund, £32,724 were carried forward. Railroad and pier sinking fund, £100,000; reserve fund, £90,124; reserve for alteration of railroad, £10,000. Dividends for last five years—1877-8, 17½ per cent; 1878-9, 16½ per cent; 1879-80, 20 per cent; 1880-1, 25 per cent; 1881 (10 months), 30 per cent. Of the existing debentures, £66,000 are repayable in one year, £214,000 in two years, £10,000 in three years, and £60,000 in five years.

UTAH.

CACTUS.—The company is working a force of men in drifting and sinking. Two drifts are running on the vein in opposite directions in good ore for concentrating. Concentrating works are building, which will be capable of handling a vast quantity of ore. The company expects soon to begin shipping the concentrates.

CLYDE.—The mine is developing to a greater extent than any in the Marysvale District, and is showing well. One tunnel has been driven 675 feet, to tap the vein at a depth of 450 feet. This tunnel will soon reach the vein. Another tunnel on the ledge has been driven 175 feet, which tapped an ore-chamber thirty feet long and twenty feet wide. From the inner end of this tunnel, a shaft has been sunk 7 by 7 feet and fifty feet deep, from which between 600 and 700 tons of ore have been taken. This ore assays 75 ounces silver, 25 per cent copper, and about $3 in gold. It carries some iron and silver, and is an easy ore to smelt.

MAMMOTH.—Matters at the Mammoth works, Tintic, says the Salt Lake *Tribune*, remain quiet, and yet preparations are going on for active operations as soon as the management meets its engagements with the men. The smelters are lying idle, so are the mines, but machinery for the reduction-works is getting into place. Twenty-six dynamo machines have been put in position for the purpose of separating copper from the matte and leaving the silver, gold, and other substances to be afterward disposed of by refining. It is understood that Mr. Goodhart, the gentleman coming from England to provide funds, will arrive here early in May, after which all matters will be adjusted and the works put in full operation again.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, April 27.

The mining market has been dull and featureless. Most of the business done at the Mining Exchange has been in Pipe Line Certificates, and mining stocks have been almost neglected. There is nothing new to note, the dealings being confined to the same fancy and low-priced stocks that have monopolized the market for the past month. Below will be found a complete summary. The total number of mining shares sold at all the Exchanges aggregates 326,892, as against 262,326 last week.

The Comstock shares have been strong under small dealings. California was quiet and steady, selling from 20@23@22c. Consolidated Virginia had a small business at firm prices, selling from 44@50@47c. Sierra Nevada was but moderately dealt in, and sold from $1.88, assessment unpaid, to $3.40, assessment paid.

Union Consolidated had a small business and showed a little strength; it sold from $3.25@$3.60. Mexican records a small business and was firm, selling from $2.55@$2.88. Hale & Norcross sold at $4.50@$3, with a small business. Savage was quiet and steady, selling from $1.88@$2.13. Yellow Jacket was dealt in to the extent of 300 shares at $2.75@$3.25. Sutro Tunnel had a small business at steady prices, selling from 20@21c.

The Leadville stocks were quiet and steady. Amie Consolidated sold from $19@$20, with a business of 7300 shares. Chrysolite was quiet and weak; it sold from $1.20@$1. Dunkin sold from 26@20c. under a small business. Hibernia sold at 3c. Iron Silver was quiet and steady, selling from $2.80@$2.90. Leadville sold from 68@69c., the transactions aggregating 600 shares. Little Chief was quiet and steady at 43@47c. Little Pittsburg was moderately dealt in at weak prices; it sold from 70@50c. Big Pittsburg has also been weak, under a fair business, and has sold from 16@10c. Climax was quiet and steady at 5@7c.

The Bodie stocks were quiet and steady. Bodie Consolidated sold from $1.25@$1.30, with a business of 350 shares. Standard was very quiet at steady prices, selling at $6.75@$7. Bulwer had a small business and was steady, selling from 80@85c. Goodshaw sold at 2c.

The Tuscarora stocks were quiet and very irregular. Grand Prize showed considerable strength at one time, but lost some of it toward the close; it sold from 80c.@$1.15@95c. Argenta sold at $1.40 to-day. Belle Isle was quiet and steady, selling from 56@50c. Navajo had a small business, and was very irregular; it sold from $2.50@$3.50 and then down to $2.25, closing at $2.30 to-day. North Belle Isle was quiet and steady at 38@35c. Independence records a fair business at irregular prices; it sold from 55@68@62c. Elk Consolidated was active and irregular, selling from 8@5@6c., the business aggregating 16,200 shares.

In the miscellaneous list, Alice sold from $3.25@3 under a fair business. The Green Mountain stocks have been very quiet at steady prices. Gold Stripe sold from 9@8c. Green Mountain sold from 85@80c. Rising Sun was quoted at 3c., and Cherokee at 2c. Hall-Anderson records a fair business, and was very irregular during the week, but developed some strength to-day; it sold from $1.40@$1.20@1.45. Horn-Silver was quiet and irregular, selling from $7.25@$8.@$7.50. Hukill sold from 12@10c., the dealings being small. Northern Belle was quiet and firm, selling from $8.38@$9.@$8.75. Robinson Consolidated continues to be actively dealt in at very irregular prices; it sold this week from 86@79c., closing to-day at the latter figure. Sierra Grande was quiet and strong, selling from $1.65@$1.85. Silver King sold at $10.38@$10.50.

Alta-Montana records an active business at irregular prices, selling from 5@3@4c. Bradshaw was quiet and steady at 28@29c. Central Arizona, with one transaction, sold at 31c. Dahlonega was quiet and steady, selling from 4@3c. Decatur was very active and very irregular; it sold from 5@2@3c. Durango was also irregular under a small business, and sold from 8@4@8c. Eastern Oregon sold from 25@19c., with small dealings. Harlem had a small business and was steady, selling from $1.40@$1.50. Hortense sold at 12c., and Lacrose from 13@11c. Oriental & Miller was quiet and steady at 14@16@15c. Rappahannock sold from 8@7c., with a business of 6800 shares. Silver Cliff was fairly dealt in at weak prices; it sold from 23@16@19c. Sonora Consolidated records a very large business, and has gradually declined from its strong prices of last week; it sold from $1.05@84@86c. South Hite sold at 18c. under a small business. South Pacific was quiet and steady at 6@5c. The State Line stocks were active at steady prices; Nos. 1 & 4 sold at 2c., and Nos. 2 & 3 from 5@4c. Taylor-Plumas sold from 17@16c., with a business of 5600 shares.

Judge Barrett has granted an order requiring all persons interested in the Battle Creek Gravel Mining Company to show cause, July 30th, why the company should not be dissolved. The company owns property in Custer County, Dakota, has a debt of nearly $15,000, and can not work the mines with profit.

DIVIDENDS.

The Calumet & Hecla Mining Company, of Michigan, has declared its quarterly dividend of $500,000.

The Jackson Mining Company has declared a dividend (No. 1) of ten cents per share.

The Total Wreck Mining Company, of Arizona, has declared a dividend (No. 1) of twenty-five cents per share, or $50,000, payable May 15th.

DIVIDENDS PAID BY MINING COMPANIES DURING THE MONTH OF MARCH, AND FROM JANUARY 1ST, 1883.

NAME OF COMPANY.	Location of mines.	Paid during month of April.	Since January 1, 1883.
Atlantic, c	Mich		$80,000
Bassick, s	Colo.	$100,000	100,000

MEETINGS.

Chase Gold and Silver Mining Company, No. 206 Broadway, Room 22, New York City. A deferred meeting of the stockholders, May 5th, at four o'clock P.M.

Conglomerate Mining Company, No. 205 Walnut place, Philadelphia, Pa. A special meeting of stockholders for the purpose of confirming the sale of certain lands to the Mendota Mining Company, May 3d, at twelve o'clock M.

Hanover Mining Company, No. 70 Devonshire street, Boston, Mass. Annual meeting of stockholders and election of trustees, May 8th, at three o'clock P.M.

Harshaw Mining Company, No. 62 Cedar street, New York City. A special meeting of stockholders for the purpose of deciding whether the company shall be wound up or not, May 15th, at twelve o'clock M.

Hibernia Silver Mining Company, No. 61 Broadway, Room 29, New York City. Annual meeting of stockholders and election of trustees, May 7th, at twelve o'clock M.

Hukill Gold and Silver Mining Company, No. 35 Broadway, Room 88, New York City. Special stockholders' meeting for the purpose of taking final action on a plan to save the company's valuable property from creditors, May 10th, at one o'clock P.M.

Silver Cord Combination Mining Company, company's office, on Iron Hill, near Leadville, Colorado. Annual meeting of stockholders and election of trustees, May 15th, at eleven o'clock A.M.

PIPE LINE CERTIFICATES.

The following table gives the quotations and sales at the New York Mining Stock and National Petroleum Exchange:

		Opening.	Highest.	Lowest.	Closing.	Sales.
April	21	$0.94⅝	$0.94¾	$0.94⅛	$0.94⅛	210,000
	23	.94⅛	.94¾	.92½	.92¾	2,291,000
	24	.93⅛	.93⅛	.92½	.93⅛	1,546,000
	25	.93¼	.93⅞	.90	.90¼	4,550,000
	26	.89⅛	.90¼	.86	.86	2,585,000
	27	.86	.89⅝	.85	.88¼	3,966,000
Total sales						15,148,000

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been more active than usual this week, and prices have been firm. Most of the business done was in the Comstock shares, Hale & Norcross being the most prominently dealt in at strong prices. The middle Comstocks were also quite active and were steady. The Tuscarora stocks were generally quiet and steady, with the exception of Grand Prize, which was quite active and very strong.

The following are the financial balances of the various mining companies on April 1st, so far as reported:

CASH ON HAND.

Alta	$18,764.08
Albion Consolidated	801.99
Benton Consolidated	5,478.75
Best & Belcher	12,691.09
Bodie Consolidated	11,193.84
Bechtel	2,820.24
Bulwer	11,269.04
Belcher	10,560.28
Crown Point	20,561.63
Choliar	3,535.40
Consolidated Virginia	61,424.34
California	2,066.46
Consolidated Imperial	344.76
Challenge Consolidated	234.23
Gould & Curry	32,484.39
Hale & Norcross	43,371.39
Jackson	794.75
Mexican	55,768.10
Manhattan	
Northern Belle	83,560.64
Ophir	31,715.13
Occidental	6,731.09
Mono	4,310.35
Silver Hill	3,500.44
Standard	121,444.98
Sierra Nevada	304.10
Savage	40,486.42
Union	29,953.44
Utah	7,082.81

INDEBTEDNESS.

Lady Washington	$852.49
Martin White	4,029.46
Potosi	7,121.57

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, April 26.

There is but little to be said about the market for mining stocks the past week. The tendency continues to lower prices, and even the dividend-paying copper mines continue to decline, with no immediate prospect of being better. Calumet & Hecla shows a falling off of $2, with sales at $231, and the stock is offered at that price, with but few takers. Franklin is a fraction higher; sales of small lots at $10¼@$10⅛, against $10¼ last week. Pewabic sold at $4, assessment ($1) paid. Quincy declined from $46@$44, which is, however, bid for it. Osceola dull at $24@$23½ for small lots. Huron sold at $1⅛, assessment ($1) paid. Nothing doing in the rest of the list.

In silver stocks, Bonanza declined to $1⅝. Catalpa and Crescent dull at 67½@62½c. for the former and 25c. for the latter. Silver Islet advanced on sale of 50 shares from $2½@$3. San Pedro declined to 60c. Sullivan advanced from $1⅛@1$^{5}/_{16}$, with later sales at $1, closing at $1⅛.

At the Boston Mining Exchange, there is but little business doing, and what business there is, is mostly confined to a few stocks at low prices. Empire is firmer, and has advanced from 18@22c., which was bid for it to-day without calling out the stock. Bowman Silver Company declined to 3c. per share, or 13c., with 10c. assessment paid. This is undoubtedly a good property, and, if well managed, might be made valuable. The course which has been pursued since putting it on the Board has not tended to inspire confidence in its management. Massachusetts & New Mexico is firm at 9@10c., but little doing in it.

3 P.M.—At the afternoon Board, there was no im-

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended April 27th, as compiled from various sources, amounted to $286,000, as against $191,000 reported for the previous week. The receipts from January 1st, 1883, to date are $4,549,713.53.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended April 21st	$186,970
Corresponding week last year	169,100
Since January 1st, 1883	4,974,087
Corresponding period last year	14,669,353

Imports.

Week ended April 21st	$49,186
Corresponding week last year	32,000
Since January 1st, 1883	6,445,122
Corresponding period last year	1,148,957

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 3 per cent. During the week, the bank lost £73,000 bullion, and the proportion of its reserve to its liabilities was raised from 37 7-16 to 38 3-16 per cent, against 44 3-16 per cent at the same date last year. April 26th, the bank lost £28,000 bullion on balance. The weekly statement of the Bank of France shows gains of 3,020,000 francs gold and 425,000 francs silver. The Imperial Bank of Germany reports a specie gain for the week of 8,580,000 marks.

METALS.

NEW YORK, Friday Evening, April 27.

Copper.—The disappearance of cheap lots has somewhat strengthened the copper market. Sales of Lake are limited to small lots, at the range of 15⅞@16c. We have been unable to verify a rumor that manufacturers had contracted for any considerable lots. We hear, however, that a round lot of Arizona black copper, reported to be 500 tons, has been sold for export, thus showing that producers are in earnest about preventing any serious over-supply. On the other hand, we hear that another concern in Globe, A. T., has stopped, it is said for good. Other brands of copper than Lake are held at 14⅞@15⅝c. England has shown a further decline, having reached to £62 5s. at one time. It has, however, reacted to £62 15s., Chili Bars.

Under date of April 12th, Messrs. French & Smith, of London and Liverpool, quote ores 12@18s. per unit.

British copper statistics have a renewed interest to producers in this country. The following are the Board of Trade returns for the first quarter:

	Jan. 1 to March 31. 1883. Tons.	1882. Tons.	1881. Tons.
Imports.			
Pure in pyrites	4,348	4,319	3,423
Precipitate	5,414	4,686	5,905
Ore	2,750	2,968	2,234
Regulus	2,012	1,819	674
Bars, cakes, etc.	9,097	8,566	7,170
	23,621	22,358	19,406
Exports.			
Pure in English raw, sheets, yellow metal, and brass	12,296	8,980	10,703
Foreign	2,209	3,235	2,048
	14,505	12,215	12,751

Tin.—This market has been steady, foreign advices, notably from Scotland, showing a firm feeling. There has, however, been no activity here, and the market closes with Straits, spot 21¼c. London closes at £96 10@£96 15s.

Lead.—The market has been exceptionally quiet, the only transaction worth recording being the sale of 250 out of the 500 tons of Germania on the dock here, at 4·60c., the bulk to a holder of lead. In this market, no lead can be bought under 4·60c.; but on the other hand, it would be difficult to place any large quantity at that figure. The rest of the Germania load has gone into store. Only a few hundred tons more are now on their way. Refined is entirely nominal.

The rate of freight on pig-lead from East St. Louis to New York is reduced from 40½ cents to 35 cents per 100 pounds.

Messrs. John Wahl & Co. write to us as follows to-day:

Our market is unchanged. Sales for the week sum up to over 450 tons of Refined at 4·25c. Hard lead is nominally 4·20c. The receipts are 550 tons, against 750 tons last week.

Spelter.—Business is quiet. Sales have been made at 4·80c., which we quote.

Antimony.—We quote 9⅞@10c. for Hallett's, and 10⅞@11c. for Cookson's.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, April 27.

American Pig.—It can not be said that buying has been stimulated much by the reduction in quotations in Foundry irons, which has now been generally accepted by the leading producers, though neither Coalbrookdale nor any other is reported as refusing to meet the market, or rather to go sufficiently below it to move red-short iron. We hear of transactions footing up from 2000 to 3000 tons. The situation is now more clearly defined, though it remains to be seen to what extent some of the producers will yield to the pressure and blow out. The first movement will probably be that those furnace-men who are not fortunate enough to draw their supplies of ores from their own mines will try to obtain concessions on iron ore and fuel. It is probable that they will at least partially succeed. This is the element which must decide whether the hopes of buyers who look for still lower prices will be disappointed or not. Forge irons have been somewhat affected, although it must be noted that this grade has been largely sold ahead. We quote $21.50@$22.50 for ordinary to choice No. 1 Foundry; $19.50@$20.50 for No. 2; and $18.50@$19.50 for Gray Forge. Bessemer pig is quiet, with $21@$21.50 the quotation for American at furnace. Foreign is nominal, but it should be noted that English quotations are weakening. Spiegeleisen is steady for the higher grade, $32 being asked, but dull for 12 to 15 per cent metal.

Scotch Pig.—The drop in American foundry iron has placed Scotch pig at a disadvantage. While it previously ranged below the equivalent grades, it is now higher. We quote Coltness at $24.25@$24.50 for early delivery; Glengarnock, $22 asked; Eglinton, $21@$21.50; and Summerlee, $24.25@$24.50. At the Wall Street Exchange, the following cables were received to-day, showing a further slight decline in the patent brands, which were relatively too high. Carnbroe, 54s. 6d.; Gartsherrie, 60s.; Summerlee 60s. 6d.; Coltness, 62s. 6d.; Langloan, 63s. 6d.; Glengarnock, 54s. 3d., and Eglinton, 48s. 3d. Warrants are 47s., and freights unchanged at 5s.

Rails.—During the week, there have been sales, aggregating 9000 to 10,000 tons, in small lots, which are at present the only quantities that can be placed for summer delivery, at about $38 at mill, which we quote, $39@$39.50 being asked for tidewater delivery. England is unchanged at £4 15s.@£5, ordinary sections.

Old Rails.—Business is quiet, the last sales of T's having been made at $23.50, which we quote. Double-Heads are scarce, and are quoted nominally $27.50@$28, at tide-water.

Scrap.—Scrap is lifeless. We quote ex ship nominally $25.

Philadelphia. April 26.

Pig-Iron.—The heavy drop in Foundry iron has not brought out buyers in the force that was looked for. Several of the strong companies have recognized the wisdom of the action of the Thomas Iron Company, and have promptly reduced quotations to $22 for No. 1 and $20 for No. 2. The purpose of this action is to restrict production to the market requirements. There are more furnaces in blast than demand requires, and the strong companies recognize that, sooner or later, restriction will be forced upon them, and they have concluded that it is better to arrest production now, when stocks are comparatively light, and when prices with a little wisdom can be maintained, rather than to wait until stocks have accumulated, and when a recovery by restriction would be impossible, or at least a very slow process. Some of the special brands are selling above $22 and as low as have been heard of are $23. But there is a general downward tendency, and it is said on the street that seven or eight furnaces will blow out in two weeks. A blowing-out will become necessary sooner or later, as, at current rates, a good many furnaces can not make iron. The founders are purchasing from hand to mouth, and look for still lower prices. A few large sales of No. 1 Foundry have been made at $21.75, and like concessions have been made on No. 2. Gray Forge iron has suffered correspondingly, and transactions have been heard of under $18 at furnace, for a fair iron; but the standard brands are still held at $18@$19. A few special brands are held above this figure. Bessemer iron can be sold at $21@$21.50, but quotations are kept at $22@$23, and in consequence only a moderate business is reported, although negotiations are still hanging fire for large lots. The movements in foreign iron are of very little importance. Small sales are made daily for current requirements. A few inquiries are in hand for Middlesborough, but, with a downward tendency in American irons, there is very little chance for it.

Muck Bars.—Our best Muck Bars are selling at $36 at mill, but the ordinary stuff is selling at $34.50@$35. Three or four lots of Charcoal Blooms were closed out at $64. Inquiries have been made for Anthracite Blooms, and sales are reported at $54@$56.

Merchant Iron.—Business in merchant iron is of an unsatisfactory character, and consumers are waiting for further downward tendency in crude material before placing large orders. Another occasion for delay is the uncertainty attending the settlement of the labor question in the West. The trade recognizes that restriction in some shape or other will soon be forced upon it, and it desires to see what action the manufacturers in the West will take. Small retail lots are moving from store at 2·25@2·30c. Large lots have been sold at 2·15@2·20c. It has been said that iron has sold as low as 2·10c., but not for first-class. Orders for Car iron have been placed at 1·90c., and when not cut to lengths, at a tenth less. Skelp iron is weak, and negotiations are in hand, but inside figures can not be given yet.

Wrought Pipes and Tubes.—A further decline has taken place in prices, and discounts are given at 70 off for steam pipes, and boiler tubes at 57½c.

Sheet-Iron.—Sheet-iron is selling in retail lots at 4@4½c., and buyers of large lots are waiting for lower prices. Stocks at mill are not permitted to accumulate, and the production is kept within bounds. Galvanized is from 35 to 40 per cent off. A large amount of business is looked for.

Structural Iron.—Sales of 3000 tons of structural iron were made this week for bridges, and additional work is under negotiation which will be placed probably next week. Steel for structural purposes is firmer than usual, and orders for angle-iron were secured at 2·50c. Tees, 3·20c. The combination price for Channels and Beams is 3½c.

Plate and Tank Iron.—An improving activity has been developed in plate and tank, though some manufacturers complain of very dull trade. Competition is active, but, as the volume of business is not sufficient to keep all mills active, there is necessarily some complaint upon the part of unsuccessful bidders.

Steel.—Steel rails are active at $39@$40 in small lots.

Old rails have scarcely any activity, and are quoted nominally at $24. Tees $27.50 for Double-Heads, and occasional sales of American are made at $23.50@$24.

Scrap-Iron.—Transactions at yard this week were at about $26 for No. 2 and $27 for No. 1.

Pittsburg. April 26.

The Western Pennsylvania iron market has been unsettled by the recent failure, and by the reduction of $2 per ton on Foundry iron in the East. If 60,000 tons of iron are thrown upon the market, even with the greatest care, it can not help to depress prices. Nothing has been decided yet. Consumers are fighting, and will not purchase except for immediate requirements. Small sales have been made at $21.50 for No. 1 Foundry, $19 for Gray Forge, and $22.50 for Bessemer. Concessions have been made on these prices for spot cash; but in view of the downward tendency, holders of crude iron report great difficulty in disposing of it. Another obstacle in the way of business is the uncertainty as to the action of the iron-workers. The manufacturers have submitted their ultimatum, which is, that, unless the workmen accept a reduction of wages of one dollar per ton, when the selling price of iron is 2 cents per pound, they will close their mills. This policy was agreed upon several weeks ago, but it is hinted that the workmen will be given another chance. Several lodges have taken action and decided to strike, but there is plenty of time between this and the 2d of June for a sober second thought. A suspension is desired by the manufacturers, especially as, under the organization made a year ago, suspension can be maintained without injury to the trade. The Western manufacturers are in excellent shape to stand any suspension, voluntary or forced upon them. The demand for finished iron is only moderate, and selling prices have declined to 1.90c.; even lower rates have been heard of, and if maximum production is kept up, still lower prices will be inevitable. Gray Forge is declining, and mill requirements are filled from week to week. The lake ore companies are still holding back, and furnace companies purchase season requirements at present figures. Steel rails are selling at $39@$40. Merchant steel is in moderate demand in small lots. Old rails are fluctuating, and offers are made at tide-water, but not accepted. Nails are selling at $3 in car load lots, and the demand for building purposes is active.

Cleveland. April 25.

The situation of last week remains unchanged in the main, more strength being developed in some sections and weakness in others. Good brands command fair prices, and off grades are not much in demand by the trade, and consequently in this grade some cutting is being done.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, April 27.

Anthracite.

We can not note any change for the better in the anthracite coal trade. Individual operators and middlemen are selling practically for what they can get, and there is quite a good deal of buying on the part of cautious consumers. The companies are maintaining an attitude of firmness, so far as appears on the surface. The only piece of more important news which we hear is, that one of the companies has taken the contract with the Pacific Mills, 35,000 tons, broken, delivered, screened, on cars, during any time of the year at Salem or Newburyport, for $5 a ton, a very low figure.

A reliable correspondent sends us the following from Philadelphia, under date of April 26th:

The local trade is dull. It is generally so at this time of the year, but not to the same extent, and the present dullness is greatly due to the effort to maintain the winter prices, which give no inducement to dealers or consumers to anticipate their wants. It is to be hoped that this mistake will be corrected to-morrow, when the city and line prices are to be fixed for May month.

Orders for shipments are also coming slower than they should at this season, and after a long winter, leaving no over-stock in the yards or cellars.

Nothing has yet been decided about curtailment for the early part of May. It is believed that some restriction must take place until coal sets moving West, which will be as soon as lake navigation opens.

Vessels are scarce, and the rates of freights the same—$1.25@$1.30 to Boston and Portland.

The following prices were fixed upon at the meeting of the Western Anthracite Joint Association:

	Buffalo, Pittsburg, Salamanca, and Bridges on cars.	Buffalo. f. o. b.	Rochester.	Syracuse.
Grate	$4.80	$5.10	$4.45	$4.20
Egg	4.90	5.20	4.55	4.30
Stove	5.15	5.45	4.80	4.55
Chestnut	5.15	5.45	4.80	4.55
Pea	3.65	...	3.30	3.05
No. 4	5.40	5.70	5.05	4.80

Bituminous.

It now appears that a number of railroad contracts have been closed, generally we hear at unprecedentedly low figures. Among those of which we have heard are the New York Central, 120,000 tons, to two Cumberland companies; the New York & New England, 100,000 tons, to Clearfield parties; the Boston & Lowell, 40,000 tons, to Cumberland and Clearfield operators; and the Boston & Providence, 20,000 tons, to a Cumberland firm. There are others pending, but so far as we can learn, not closed.

The statement has been made that bituminous coal had sold as low as $4 per ton. In explanation of this, it may be stated that this has been done to frustrate any heavy purchases abroad for the steamer trade, and covers this year's delivery. We quote Clearfield alongside $4.20@$4.50 and Cumberland $4.30@$4.60, according to quality.

STATISTICS OF COAL PRODUCTION.

The Transportation of Coke over the Pennsylvania Railroad for the week ended April 21st and year from January 1st:

Tons of 2000 lbs.	Week.	Year.
Penn. RR. (Allegheny Region)	2,293	38,014
West Penn. RR	2,071	31,959
Southwest Penn. RR	42,660	594,141
Penn. & Westmoreland Region, Pa. RR	5,878	74,657
Pittsburg, Penn. RR	....	274
Snow Shoe (Clearfield Region)	760	5,372
Total	53,662	744,417

Horsford's Acid Phosphate

In Despondency, etc.

DR. W. S. POWELL, Defiance, O., says: "I have used it with satisfactory results in dyspeptic ailments associated with great mental depression or despondency."

DIVIDENDS.

SAN FRANCISCO, April 14, 1883.

THE FATHER DE SMET CONSOLIDATED Gold Mining Company has declared dividend No. 27 of TWENTY CENTS per share, payable at the office of Laidlaw & Co., 14 Wall Street, New York, on the 30th inst. Transfer books will close on the 23d.

H. DEAS, Secretary.

NEW YORK, April 13, 1883.

THE CONTENTION CONSOLIDATED MINING COMPANY has declared its regular monthly dividend, No. 15, of

TWENTY-FIVE CENTS PER SHARE,

payable April 28th, 1883, at the office of the Farmers' Loan and Trust Company, No. 26 Exchange Place, on all stock registered in New York.

Transfer-books close on April 18th.

W. HART SMITH, Vice-President.

A. H. McNEAL,

Office and Works, - - - - Burlington, N. J.

MANUFACTURER OF

CAST-IRON GAS & WATER PIPE

FROM 1¼ TO 48 INCHES DIAMETER.

ALSO, ALL SIZES FLANGE AND SOCKET PIPE FOR MINE WORK.

Sugar-House, Large Cylinders, Lamp-Posts, Branches, Bends, and General Foundry Work.

"ABERNANT"

DINAS FIRE-BRICKS AND CEMENT

Unrivaled for Endurance under Intense Heat

Percentage of Silica, 95·64.

ALL SHAPES AND SIZES IMPORTED TO ORDER. DIAGRAMS FURNISHED.

A. T. CHUR,

SOLE AGENT FOR THE UNITED STATES,

No. 64 Broadway, New York.

ASSAYERS' SUPPLIES.

(Established 1848.

Balances and Weights, Furnaces, Scorifiers, Cupels, Crucibles, Tongs, etc.

A LARGE STOCK. Also

CHEMICAL APPARATUS OF ALL KINDS.

Trial orders solicited. E. B. BENJAMIN,

6 Barclay and 12 Vesey Sts., New York.

BRADLEY'S INSULATED AIR COVERING,

FOR

BOILERS, STEAM PIPES, etc,

Prevents condensation of steam and radiation of heat.

SHIELDS & BROWN, 78 & 80 Lake Street, Chicago.

Send for Illustrated Circular, and name this paper.

EDDY VALVE CO.,

Waterford, N. Y.,

Brass & Iron Valves—All Styles.

FIRE HYDRANTS.

THE NEW PULSOMETER

CHEAPEST, STRONGEST, MOST SIMPLE, COMPACT, DURABLE, EFFECTIVE & ECONOMICAL

STEAM PUMP IN THE MARKET,

for raising liquids under and up to 100 feet. No Machinery, No Oil, No Special Care. Can be worked suspended by a chain. Will pass grit, mud, sand, pulp, etc., without injury to its parts. Needs only a steam pipe from boiler to run it. Price, 600 gallons per hour, $50; 1,200 do. $75; 3,600 do. $100; 6,000 do. $150; 10,000 do. $175; 18,000 do. $225; 25,000 do. $275; 45,000 do. $400; 80,000 do. $500; 120,000 do. $1,000. Compare this with any other Pump List.

Write for illustrated descriptive book with testimonials, &c. *Mailed free.*

MR. H. B. HERR leaves Chicago on a professional trip to the West on May 15th.

A PETITION is circulating to ask the next Congress to place the duty on tin plates at 2¼ cents per pound, instead of 1 cent, as provided in the new tariff, and 1·1 cent as fixed by treasury rulings and now in force.

MR. KNIGHT NEFTEL, of Messrs. NEFTEL, CHURCHILL & PARKS, mining and civil engineers, will leave for Colorado on professional business, on the 7th inst. All communications addressed to the office of the firm, No. 39 Broadway, New York City, will be immediately forwarded to him.

MR. F. R. HUTTON, Secretary of the American Society of Mechanical Engineers, announces that the summer meeting of the society will be held at Cleveland, O., beginning Tuesday, June 12th. It is reported that an opportunity may be afforded to visit the Exposition of Railroad Appliances at Chicago.

THE International Electric Exhibition to be held in Vienna this year promises to become truly representative of recent progress. From the bulletins issued in rapid succession, we notice that almost all the leading inventions and the principal manufacturers of machinery and supplies will be represented.

WE print this week a second installment of Prof. W. P. BLAKE'S monograph, *Description of the Silver King Mine*, which has been published, handsomely printed in pamphlet form, by private parties. We are indebted to Professor BLAKE for our illustrations. The original report contains a number of maps and views for which we can not make room, and those who desire to study them in detail are referred to it. Our extracts are too eloquent a proof of the scope and character of the work to call for any words of commendation on our part.

THE basic process is making headway much more slowly in the open-hearth than in the Bessemer converter, though it is for good reasons particularly well adapted to the manufacture of high grades of steel from impure raw materials, which open-hearth makers have always been threatened with. Scrap is proverbially a tricky raw material, coming as it does from all sorts of sources. To open-hearth steel melters, emancipation from pure pig and anxiously selected scrap is a very important point, especially as it is accompanied with the peculiar advantage due to the open-hearth that the quality of the final product is completely in the control of the melter. We know now, from the experience of the past few years in basic Bessemer practice, that for the converter the pig must have a composition varying within certain pretty narrowly drawn limits. This is not the case for the open-hearth, and there are no close restrictions, notably in respect to sulphur, of which only 60 per cent is eliminated in the converter. Almost the only consideration which need govern those using the basic open-hearth process is the one of price of the raw materials, almost irrespective of their quality. Where scrap is not available, blowing of air through immersed tuyeres, as is done at the Phœnix works, in Germany, may be substituted. The trouble of making a suitable junction between the acid brick of the roof and the basic material constituting the hearth has been solved by M. POURCEL, of Terrenoire, by a joint of chrome iron ore ; and by WALRAND, of Creusot, by the use of bauxite. As to the quality of the product of the basic process, whether carried out in the converter or the open-hearth, there can be no doubt. Numerous analyses and mechanical and working tests prove its superiority to ordinary, and its equality with best grades of wrought-iron.

IN the very intelligent and interesting annual report of Mr. HEBER S. THOMPSON, Engineer of the Girard Estate, made December 31st, 1882, we find an account of the system of mining coal pursued by the Lehigh Valley Coal Company, at the Lehigh colliery, which is leased by that company. Mr. THOMPSON says :

"The working out of the coal has not here followed closely the extension of the gangways, as is the usual method. On the contrary, pillars of solid coal, fifty yards in width, have been left unmined between every two breasts, which will be mined in succession from the ends of the gangways toward the slope. In the six thousand yards of gangway now opened on these four levels, only one hundred breasts have been opened, between which solid pillars of coal have been left, sufficient for the opening of two hundred breasts more. This method of mining, always the most economical and productive, but rarely adopted, was specially wise at this colliery, because of the heavy weight of rock bearing upon the coal, produced by the inversion of the north-dipping rock and consequent crushed and loose condition of the coal of the synclinal axis. If breasts had been opened here in the ordinary way, a large proportion of the coal which will now be taken out would have been lost."

We understand that this system is practiced also at the Potts colliery of the Reading Company, near Ashland. In Vol. V., p. 421, of the Transactions of the American Institute of Mining Engineers, a similar case (though not in anthracite) is cited from Longdale, West Virginia. The discussion of Mr. WETHERILL'S paper on anthracite mining found in that volume is full of interest ; and the advocacy of wider pillars then expressed by Messrs. COXE, RAYMOND, and others, was not only very generally approved, but seems to have received the indorsement of success in practice since. We are glad to see this system making progress, and we shall be pleased to chronicle any further instances of its application.

MATTERS in the Western coal and iron trades are beginning to assume a gloomy aspect. The conference between the representatives of the Western Iron Association and of the Amalgamated Association has been held, and the conclusion promptly reached that neither party would yield to the arguments of the other. We hardly believe that this ends all efforts at a compromise, because it will not be until the first of June that

Digitized by Google

any changes will go into effect. At present, there is probably nothing but preliminary maneuvering, and neither the employers nor the employés are probably willing to forego the faint chances that the situation in the trade may afford developments during the next two or three weeks which will be favorable to them. As matters now stand, the position is partly clearly defined. The trade is suffering from overproduction, partly real and partly apparent, through the usual tactics of buyers of keeping out of a falling market. Prices have reached a very low figure, merchant in Pittsburg having sold as low as 1·80@1·90c., while a year ago, when the same wages were prevailing, it ranged between 2·30@2·40c. It is true that pig-iron and scrap are lower, and that fuel is cheaper; but these items do not compensate for more than a part of the falling off in the selling price, and manufacturers demand a scaling down in wages of from 10 to 20 per cent. Last year, the men asked for an increase and did not get it, even after a long struggle; this year, they resist a reduction, and as is usual in such cases, may be even more willing to stand off for a long period. As we have already noted, a forced restriction would do the trade much good, and might ultimately lead to a revival of the demand.

In the coal trade, the labor troubles are assuming a serious aspect. A scaling down of wages is attempted in the Pittsburg District, in Ohio, Iowa, Illinois, and other Western States, and has been partially successful. It is the natural result of an enormous expansion in the production, and a partial decline in the consumption, leading to a serious decline of values. The railroad pits of the Pittsburg District are out against a reduction from 3½ to 3 cents per bushel for mining, and the men profess to be determined to use all efforts to keep the mines idle.

IT is of interest to call attention to the fact that the Wallace Voluntary Trade Tribunal bill has passed the two houses of Pennsylvania, and, we understand, has received the sanction of the executive. High hopes are pinned to this measure; but while we heartily indorse honest efforts to avoid the constantly recurring struggles between employers and employed, we are not sanguine as to the good that will come of it. A brief summary of its principal features will show its scope and its shortcomings. The bill provides that, upon petition by a specified number of the employers and men in a trade in a district, the presiding judges of the courts of common pleas have the power to issue a license for the establishment of a tribunal to settle disputes between employers and employed. The petition shall be signed by at least twenty-five workmen and five employers. The tribunal shall consist of at least two employers, or their representatives, and two workmen, and no pleading by attorneys shall be allowed before them. The chairman or umpire shall have authority to examine books, call witnesses, etc., but he shall only be called upon to act after disagreement is manifested in the tribunal by failure during three meetings held and a full discussion. The umpire's award, when entered on record in due form, shall be final and conclusive, and the proper court may on motion thereon enter judgment and issue final process to enforce the same, but—and this is the most important clause—upon questions affecting the price of labor it shall in no case be binding upon either employer or workman, save as they may acquiesce therein after such award. The bill, therefore, aims first at affording the means of bringing about a free interchange of data with a view to conciliation, and after that has failed, gives the chairman the power to act as arbitrator. The trouble which we fear will make the bill valueless is, that the vital question, that of wages, will remain unsettled.

Experience in the coal and iron trades of Great Britain and in this country has proved that while boards of conciliation and arbitration are often necessary, and have undoubtedly done good, they have disastrously failed in a number of instances through lack of faith on the part of the men, or because their representatives were not empowered to act. Last year, after over ten years of experience, the men in the North of England iron trade calmly repudiated their representatives and struck against the award.

The Wallace bill may do much to clear away obstacles that lie in the way of a free interchange of opinion; but it does not yet strike at the root of the evil. It will, we hope, receive the benefit of a thorough test, and we hope it may pave the road to a more incisive measure. The objection has been raised against it that it establishes a close connection between the proposed boards and the courts, that the good sense and honor of both parties should be trusted to enforce its decisions. We know, however, from the history of the movement, that these can not be relied upon, and the features of the Wallace bill looking to compulsory settlement are among those most to be commended.

A CORPS of Vanderbilt engineers are at work extending a line from Deeter's Gap, in Somerset County, Pa., to Garrett, on the Baltimore & Ohio Railroad. It is believed that it is intended to run a branch from the main line in this way into the coal-fields of Brothers Valley, Summit, and Elk Lick townships.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes. We do not hold ourselves responsible for the opinions of our correspondents.]

Bessemerizing Copper Matte.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In reply to Mr. Howe, in your issue of April 21st, allow me to mention only the following: The first attempts to Bessemerize copper matte were made in Russia in 1867 by Jossa and Laletin, by forcing either air or steam, or a mixture of both, through molten copper matte in a converter described in the *Oesterreichische Zeitschrift für Berg- und Hüttenwesen*, 1868, No. 50; in *Berggeist*, 1868, No. 50; and *Jernkontorets Annaler*, 1882, Vol. II. Experiments were made in 1868 at Vestanfors, in Sweden, by Stridsberg and Kollberg, to Bessemerize iron pyrites rich in copper, in a converter, mentioned in *Jernkontorets Annaler*, 1882, Vol. II. Rittinger proposed in the *Oesterreichische Zeitschrift*, 1871, No. 35, to blow compressed air in copper matte in a reverberatory furnace, and to put in silica to take care of the oxidized iron.

I did not mention any thing about Mr. Howe's experiments, for the natural reason that I did not know any thing about the nature and quality of his experiments. When I read Dr. Tamm's description of the process in France to the superintendent at Bergen Point, I was told that the company had made experiments in a similar way before; but these experiments had not been successful. When I told my ideas of Bessemerizing copper matte to Mr. J. L. Thomson and Mr. W. C. E. Eustis, just before I left Bergen Point, these gentlemen did not mention any thing about their having made such experiments before. PAUL JOHNSSON.

ISHPEMING, MICH., April 27.

Bessemerizing Copper Matte.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: I have followed with much interest the controversy about Bessemerizing copper matte between Messrs. H. M. Howe and Paul Johnsson in your valuable paper. I have just now received the copy of April 21st, in which Mr. Howe ascribes the priority of the Bessemerizing to Mr. Hollway, and the use of tuyeres in reverberatories for the same purpose to himself. Permit me space enough to correct this. I patented the Bessemerizing of matte in 1866; and a few years ago, when Mr. Hollway's process was much talked about, I sent you a copy of my patent, which you were kind enough to publish. I began the use of tuyeres in reverberatories for oxidizing matte in 1867, at the Ducktown copper-mines, and continued it with much success until 1875, when I left that place. Mr. Howe, no doubt, was not aware of these facts; nor do I consider them great inventions, and I think that any rational copper-smelter would invent them if placed in my position. A. RAHT.

FRANCKLYN FURNACES,
NEAR SALT LAKE CITY, UTAH, April 28.

THE ENGLISH GUNPOWDER TRADE.

The *Ironmonger* prints the following wail: The gunpowder trade has within the past two months shown a slight improvement, so far as the colonial demand is concerned. Some good lines have been received from Australia, and several rather large contracts are in immediate prospect. The home trade, however, has remained very quiet, the effect of the mild and wet winter being still felt by manufacturers. As we pointed out a few months ago, the gunpowder industry of this country is slowly undermined by the disadvantages under which manufacturers labor as compared with their rivals on the continent, in consequence of the many vexatious restrictions to which they are subjected. The explosives act of 1875, which was intended to prevent abuses and to insure every reasonable precaution against accidents, unfortunately contains superfluous clauses, such, for instance, as those relating to "incorporation" and other processes of manufacture. Thus the legislature has so heavily handicapped our manufacturers that every opportunity has presented itself to the German makers to develop their foreign connection, and so weaken our position, and they have not been slow to avail themselves of the advantage. It is, moderately stated, very hard that makers, especially the older firms, who in the past have not hesitated to make great sacrifices when the country needed their help, should now find their foreign trade destroyed by the operation of an arbitrary law. But the law being as it is, it is only reasonable to expect that the government officials should adhere strictly to the spirit as well as the letter of the act. But whether the act is good or bad, it is held to be very hard for the authorities in this country to accept tenders from continental makers because they quote a cheaper rate than English firms; and yet this is what has just been done. Four fifths of a very large contract for prismatic powder for heavy ordnance has been intrusted to German makers, which means a loss in value of about £50,000 to English producers. That such an incident should have occurred in face of the known fact that it is the existing law, and nothing else, which prevents our makers quoting equally low prices, is almost past belief, especially when it is remembered that the commodity is gunpowder, and for national use.

WATER-GAS FUEL FOR STEAMSHIPS.—A test is about to be made in England of the use of water-gas as fuel for steamships. The Mauritius Steamship Line has built a steamship called the Heron of 1000 tons burden, and provided it with the apparatus invented by Dr. C. Holland for making water-gas. Dr. Holland's process has been tested on the Long Island and Erie railroads; but this is the first time that it, or any similar process, has been applied to a steamship. The Heron is to ply between London and the islands of Mauritius and Madagascar, and it is expected that she will start on her trial trip on May 10th. She has been fitted out with six furnaces precisely like those placed by Dr. Holland in the experimental locomotive named after him on the Erie road.

COMPARATIVE MERITS OF BRIMSTONE AND PYRITES FOR THE MANUFACTURE OF SULPHURIC ACID.

(WITH SUPPLEMENT.)

The recent rapid rise in the price of brimstone has stimulated so energetically the substitution for it of pyrites that several of the largest of our acid manufacturers have replaced their brimstone-burners by pyrites-kilns. But the great majority still hesitates or refuses to see the advantage of the change; regarding the high price of brimstone as but temporary, and denying that, with brimstone at from $20 to $25, there can be any economy in the use of pyrites. Yet in England and Scotland, where the price of Sicilian brimstone is as low as here, and where the same methods of manufacture are employed, acid is made so cheaply that phosphates are imported into England from this side the Atlantic, made into manure, and exported for sale here at figures with which our manufacturers find it difficult to compete, if we may judge from the fact that they were desirous to tax the acid in imported superphosphates. This is not a case in which the convenient excuse of high labor here and cheap labor there explains the anomaly; for the item of labor cost in the manufacture of both acid and manure is fractionally small as compared with that of material. The real reason is, that the sulphur out of which English and Scotch acid is made is derived from pyrites, and is so much cheaper than the brimstone which acid-makers here persist in preferring that chamber acid there costs about one half what it does here, and therefore all the articles into whose production acid enters are correspondingly cheaper. At present, pyrites is offered here almost at English prices; but were a large market to be opened for it, competition would be found to enter, with the inevitable result of low prices. But even at present prices of pyrites, acid can be made from it more cheaply than from brimstone at its lowest possible price; as is shown by the following comparative estimates, based upon English practice and our prices, calculating brimstone of 98 per cent at $25 per ton, and the sulphur saved from a 48 per cent pyrites, say 45 per cent, at 15 cents per unit.

ESTIMATE OF COST OF MAKING BRIMSTONE AND PYRITES, AND THE COST OF BRIMSTONE ACID.

Six tons of brimstone producing 18 tons of oil of vitriol at $25 per ton	$150.00
Niter—8 per cent of the brimstone used, at $2.75	28.60
Coal—5 tons, at $4	20.00
Labor—2 men burn 6 tons weekly, feeding 40 pounds hourly to each of two burners. The same men keep up steam, fire the lead evaporators, and do all the general work. Fourteen days' labor, at $1.50	21.00
Distillation and general labor, fourteen days, at $1.50	21.00
Repairs	4.00
	$244.60
Equal per ton of oil of vitriol to	13.58

COST OF PYRITES ACID.

13·06 tons of pyrites, if 45 per cent be saved, will yield 588 units of sulphur, and, at 15 cents per unit	$88.20
4½ per cent of niter on the sulphur contents, equal to 5·02 cwts., at $2.75	14.30
4 tons coal, at $4	16.00
Labor—Each battery of 27 kilns is in England worked by one man per shift of eight hours. Each man charges, shakes down, and removes the cinder from nine kilns, and pots the niter as required. Thus the 27 kilns are fed and discharged once each twenty-four hours with 5 cwts. of pyrites, equal to 6¾ tons, which yield 303 units of sulphur and are handled by 3 men, at $1.50 each. Therefore 588 units are handled for	8.73
In England, the usual contract price for breaking the pyrites by hand into lumps two inches square is 25 cents per ton; allow 50 cents here; therefore, breaking 13·06 tons, at 50 cents, costs	6.53
Concentrating to 44 degrees in Glover tower, and to 66 degrees in platinum stills	10.00
Repairs	6.00
	$148.76
Equal per ton of oil of vitriol to	8.22

In the preceding estimates, the difference in the consumption of niter is noteworthy, due to the fact that there is not in brimstone gas, except when in large volume in very large works, enough heat to enable the Glover tower to be used, whereas, it is a necessary part of the pyrites plant. The concentration to 44 degrees is, therefore, in the brimstone plant, usually effected in lead pans at the expense of more fuel than is consumed in pumping acid to the top of the tower in the pyrites plant. Hence, I have allowed five tons of coal in the one case, as against four tons in the other.

Although the cost of actually handling pyrites exceeds that of an equal weight of brimstone, nevertheless the item of labor in the pyrites account is less than in the brimstone account; and this difference grows greater the richer in sulphur the pyrites. The proportionate loss of sulphur in burning a rich pyrites is also much less than when burning a poor, independently of the fact that, in a siliceous pyrites, a certain amount of sulphide of iron is likely to be so enveloped in incombustible gangue as to be protected from all action. If 5 per cent of a 35 per cent pyrites is lost, one seventh of all the sulphur remains behind; if 5 per cent of a 45 per cent is lost, one ninth remains. But what is recovered in the former case stands to what is recovered in the latter in a much lower ratio, namely, as 30 per cent to 40 per cent, or as only 3 to 4. Although, however, the cost of burning pyrites is less than that of oxidizing an equivalent quantity of sulphur from brimstone, there are disadvantages attending the use of the mineral. The pyrites-kiln is more costly to build than a sulphur-burner. Again, under the most favorable circumstances, a kiln of the ordinary size will deliver 300 pounds of sulphur as sulphurous acid; while a sulphur-burner will consume 960 pounds; consequently, the space occupied by a nest of kilns is at least four times greater than that covered by sulphur-burners of the same capacity. Owing to the somewhat greater heat of the gases as they enter the chamber, as works are usually constructed, even when a Glover tower is interposed, the wear of the first chamber is greater when pyrites than when brimstone is used; and this is much more the case if the pyrites contains arsenic. But admitting to their fullest extent the cogency of these objections, the latter of which are allowed for in the above estimates by nearly doubling the item for repairs in the pyrites account over a similar item in the brimstone account, there remains so large a balance to the credit of pyrites that it should require but little argument to decide the wavering in its favor.

Properties of Pyrites.—But much of the advantage depends on the character of the pyrites. If we take the experience of English acid-makers, we find that up to 1860 they drew their supply largely from Wicklow, Ireland, where there are large beds of a hard slaty pyrites, the richest portions of which alone were exported, and of which richest portions the following average of four assays by Clapham shows the composition:

Sulphur	38·79	Lead	1·80
Iron	36·06	Arsenic	·39
Copper	2·57	Insoluble	19·71

Not a ton of Wicklow pyrites now enters the market. It burns, owing to its compact structure, with difficulty. The proportion of insoluble matter being high, the cost of burning off the sulphur is proportionately so. The iron in the residuum is too low to fit it for fettling, and the percentage of copper below that of Spanish pyrites.

Another pyrites which at one time was largely used, but has gradually fallen into disuse, is from Norway. The following average of assays, by Pattinson & McCulloch, explains some of the reasons why:

Sulphur	47·55	Zinc	1·26
Iron	41·92	Carbonate of lime and magnesia	3·38
Copper	·90	Insoluble	.615

Here the percentage of sulphur and iron is high and that of silica low; but the copper is present in unremunerative quantities, and the ore is so hard that it burns slowly. Nevertheless, it would have displaced the Irish and English pyrites and occupied the market, had not Spain supplied it with an ore that meets so perfectly all requirements that it has excluded from the English market all competitors, and may be accepted as the standard by which to estimate the merits of all pyrites for acid-making. An average of four assays of Spanish by Pattinson gives:

Sulphur	47·87	Zinc	·10
Iron	40·93	Lime and magnesia	·19
Copper	3·82	Arsenic	·26
Lead	·62	Insoluble	5·42

Looking at the chemical composition of the pyrites from Spain and Portugal, we find the sulphur contents to be high; the iron and silica to bear such relationship to one another that, after roasting and extracting the copper, the iron oxide is high and pure enough and the silica low enough to make a suitable material for lining puddling-furnaces; while its entire freedom from phosphorus gives this "blue billy" exceptional value when pressed into bricks for the making of Bessemer pig. The percentage of copper in the above analyses is slightly higher than the general run. It is always extracted in the wet way, and so extensively are these low-grade ores worked that their copper forms one of the most important items in the world's present supply, amounting to nearly 40,000 tons. The next ingredients, lead, zinc, calcium, and magnesium, must exist in very small quantities in a good pyrites, one reason being that in roasting they are converted into sulphates, and therefore occasion a proportionate loss of sulphur; another, that when in large quantities, they reduce or destroy the value of the iron as a by-product. The presence of the next element, arsenic, in any proportion, no matter how minute, is prejudicial. It tends to corrode the chambers, it consumes niter, and it vitiates the acid, rendering it unfit for the manufacture of any article that enters directly into human food. Were it entirely absent from Spanish and Norwegian pyrites, no brimstone would be used in England; but as it is, all acid for pharmaceutical purposes and for the manufacture of food must be made from brimstone. And arsenical acid is objectionable in cleaning iron for galvanizing and in finishing copper sheets and wire. Any pyrites, therefore, which is absolutely free from this poison would bear on that account an extra price. And there is reason to believe that this advantage is possessed by some of our native ores. There is, however, a difference between one Spanish and Portuguese ore and another. The Mason ore generally commands 1½d. per unit more than any other, on account of its hardness and very slight liability to clinker. Between Tharsis and Rio Tinto, there is but little to choose.

Ores in the American Market.—At present, there are bidding for purchasers in our market both home and foreign pyrites. *Rio Tinto pyrites*, whose character is so well known and whose reputation is so thoroughly established that its agents have but to point to the fact that it and its related ores have replaced all others in the European market, and that probably three fourths of the acid of the world is made from them, is regularly imported. Though not the favorite among the pyrites of the Peninsula, it yet is neither so hard as to burn reluctantly, nor so soft as to make in breaking an undue proportion of fines. Its percentage of sulphur is so high as to make the cost of burning the lowest possible, and both its iron and copper are in proportions sufficient to give them value. Were there less arsenic, it would be a point very much in its favor.

The acid trade owes to the *Orford Nickel and Copper Company* no small thanks for having first induced more than one of our largest acid-makers to use pyrites properly and extensively. Its pyrites from Capelton, in the Province of Quebec, Canada, though not free from arsenic, is probably purer than the Spanish; but it is lower in iron, and therefore the wet treatment applied to Spanish pyrites, and which depends in a measure for its profit on the iron residues, has not been adopted for recovering the copper from its cinder.

From Maine and New Hampshire, comes some pyrites; but it is so contaminated with blende and galena, the zinc and lead of which, as already pointed out, lose in roasting almost none of their sulphur, but are converted from sulphides into sulphates, that its value for acid-making is seriously impaired.

The Davis mine, in Massachusetts, however, has, within the past half-year, been sending to the market a pyrites of remarkable excellence. The returns of the Merrimac Chemical Company, which has used 3000 tons since March, show that it has actually recovered as acid 47 per cent of sulphur. It is claimed to be absolutely free from arsenic; and zinc, lead, and other objectionable elements are in very small quantities; while it possesses copper in remunerative quantities. The company publishes as its average contents:

Sulphur	50·30	Silica	3·19
Iron	42·83	Zinc, lime, etc	0·61
Copper	3·07		
			100·00

It is granular in structure, and therefore in breaking makes a larger quantity of smalls than a more compact ore; but as a compensation for this disadvantage, it burns so freely and so perfectly that kilns of a given area will roast more of it per diem than of a more compact ore; and in a

Digitized by Google

shallow layer, the disintegration within the kilns is not sufficient to impede the burning. As depth is attained in the mine, this single defect is rapidly disappearing. The objection to smalls is, however, less than it was. A good deal of ingenuity is expended in devising a mechanical furnace in which to burn granular pyrites and pyrites smalls; and with such results that it is not unlikely that ere long fines will be preferred to lumps, both on account of less cost of burning in mechanical furnaces and on account of more perfect elimination of the sulphur.

A still more granular ore is in the market from Virginia. The Virginia pyrites possesses the same valuable property which characterizes the Davis, complete freedom from arsenic, a property to which none of the European ores can lay claim; but it is barren of copper, and when copper is absent, the cost of preparing the iron for ore exceeds in most localities its value.

Alterations of Plant.—The only essential alteration in the existing plants erected for the burning of brimstone to fit them for roasting pyrites is in the kilns. Most brimstone plants, by reason of the paucity of heat in the gases, do not use the Glover tower, while no pyrites plant can well be without it, and therefore this economical adjunct to the kilns is virtually a necessity. Chambers of a given capacity for brimstone will yield only about two thirds as much acid when supplied by kilns, and consequently increased chamber-space is necessary in a pyrites plant. But the cost of the alterations is trifling compared with the advantages.

The construction of the kilns will be understood from the accompanying illustrations, Figures 1 to 12, copied from Lunge. The kilns are cased in iron plates, and the touching surface of the doors and openings planed. The uppermost door gives access to the space between the double roofs which serves as a dust-chamber and as a flue to lead off the gases from the kilns to the Glover tower. Below is the charging-door. The door next below should seldom be opened. It is intended to reach large scars and clinkers which may have been produced by excessive heat. The next, the long, narrow door, opens on the grate-bars, whose shape and arrangement and mode of working the illustration sufficiently explains. The last, the ash-pit door, is necessarily large. The dimensions of the kilns' superficial area vary much with the fancy of the builders, although 4 feet 6 inches by from 5 feet to 5 feet 8 inches of grate surface may be accepted as a standard size. The depth is determined by the character of the ore. Hard and infusible pyrites like the Norwegian may require a greater depth than a free-burning ore, from which a strong gas and good roasting may be obtained from a depth of from one foot to eighteen inches. This is the case in roasting the ore of the Davis mine. In any case, the large proportion of the sulphur should be burnt off and all vivid combustion occur on the surface between each charging; otherwise, a heat sufficient to produce sintering or even fusion would be engendered in the center of the mass. The usual practice in England is to charge the kilns once in twenty-four hours with from five cwts. to seven cwts. of ore, as already explained in the estimate of cost. All clinkers which reach the ash-pits are returned to the kilns and worked over as part of the regular charge; for not only do they occasion loss of sulphur, but the copper companies refuse to receive them.

In the contracts between the sulphur companies and the English manufacturers, it is stipulated that not more than 10 per cent of fines shall be delivered. In breaking the ore, even by hand, 10 per cent more is produced. In Great Britain, the smalls are consolidated by grinding them in a pug-mill with enough water to make a paste, and spreading this in a layer half an inch thick on the roofs of the kilns. Enough of the sulphuret of iron is thereby oxidized to bind the grains so firmly together that, on drying, the cake becomes as hard as lump ore, and burns even more freely. The cost of making these cakes in England is fifty cents per ton.

In France and Germany, shelf-burners are preferred to caking the ore as in England. One of the best is that proposed by Schaffner and illustrated, from Lunge—Figures 13 to 17—with such detail that minute description is needless. Seven shelves, on which doors open, stretch from side to side of the kilns, but, as shown in Fig. 16, leave alternately an open space between either front or back walls and their free edges. Ore is introduced through a hopper in charges of 250 pounds every four hours on to the upper shelf, after the lower shelves have been successively emptied. The capacity of such a burner is, therefore, over three quarters of a ton per day, or about thrice that of a kiln for lumps, which compensates for a greater cost of construction and greater expenditure of labor in working. The sulphur can be very thoroughly eliminated, but the gas is liable to be weaker than kiln-gas, due to the more frequent opening of the doors. This burner is the product of earlier inventions by McCulloch, Perret, and Olivier, who supported shelves in the upper part of the lump-kilns. Other classes of dust and smalls-burners have for their types the Gerstenhöfer, where the ore falls from the roof toward the floor, being arrested in its fall by tiers of fire-clay bars stretching from wall to wall; the Malétra furnaces, where the ore slides down automatically a series of inclined shelves supported in a tower attached to a lump-kiln; and the Spence furnace, where a rake is drawn mechanically from end to end of a long muffle, stirring the ore and discharging at each motion a given quantity. All these various forms of burners yield a roast so low in sulphur at a cost so reasonable per unit of sulphur burned as to make the objections to pyrites smalls less forcible than they used to be.

J. D., JR.

FREIGHT RATES TO THE BLACK HILLS.—At a meeting of the railroads and stage lines, the following rates to the Black Hills points were decided upon for freight from Chicago and Milwaukee or adjacent points: To Rapid City, $3.25 per 100 pounds; to Fort Meade, $3.35; to Deadwood, $3.50; to Crook City, $3.40; to Sturgis City, $3.35; to Central City, $3.60; to Spearfish, $3.50; to Lead City, $3.65.

THE NEW YORK IRON AND METAL EXCHANGE.—At a meeting of the New York Iron and Metal Exchange, the treasurer submitted a statement. The expenditures were $819.85 property account; $4720.84 for miscellaneous expenditures, including printing of market reports, telegraph service, etc.; $2387.90 for salaries; $2838.87 for rent; and $14,529.95 balance on hand. For the purpose of keeping up the organization until the new organization has been effected, the officers of the company were re-elected. President Edward P. White delivered an address to the members in which he summarized the work done by the Exchange during the past year.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

TOWN-SITE VERSUS MINERAL CLAIMANTS.

The following two decisions affect the vexed question of town-site *versus* mineral claimants:

The United States Supreme Court in a case before it settled the following points: That land embraced in a town-site on the public domain, when unoccupied, is not exempt from location and sale for mining purposes, even after the establishment of a regular municipal government, but only from settlement and sale under the pre-emption laws; the act of issuing a patent by the General Land-Office, in cases within its jurisdiction, is conclusive of the legal title and of all the facts on which it has to pass before the issuing of patent, and can not be attacked collaterally; hence in an action of ejectment brought by a patentee, it can not be set up as a defense that the land was not of a character required for the issue of such a patent, or that the patentee was not a citizen, or that he had used fraud and perjury in obtaining the patent, such being matters which the commission had to act upon, or which only could be raised by direct proceeding attacking the patent. The issue of a patent is conclusive proof that the requisite notices were given; the point that an owner is estopped from claiming land when he has lain by and seen another make improvements on it can be raised only by one who is ignorant of his defective title.

Secretary Teller has rendered the following decision:

SIR: I have considered the case of Batista Papina *vs.* Thomas Alderson, Stephen Cocking, and Charles Weiner, applicants for patent to the Enterprise mining claim, situated in Sec. 7, 10 N., 11 E., Sacramento District, California, within the limits of the Placerville town-site, entered July, 1871, patented September 10th, 1872.

The patent to the city authorities contained this reservation: "No title shall be hereby acquired to any mine of gold, silver, cinnabar, or copper, or to any valid mining claim or possession held under existing laws of Congress;" following the language of the act of March 2d, 1867 (14 Stat., 541), and the cumulative provision of the amendatory act of June 8th, 1868 (15 Stat., 57).

The lands embraced in said town-site had been declared non-mineral, after regular hearing, by the decision of your office rendered November 17th, 1871, from which no appeal had been taken; but after said decision, mineral affidavits were received, resulting in delay in issuing the patent, and in the filing of certain communications on behalf of the mayor and corporate authorities, conceding the fact of the existence of several known mines and claims, and consenting to the insertion of the reservation in the patent, as defined by law. Since that date, several of these old claims have been applied for and patented, with regularly defined surface ground, shown by accompanying evidence to have been necessary to the use and actually used for the working and operating of the mines. In all the cases examined by me, I find that the continuity of the claims, as respects possession and transfer, has been shown from a period anterior to the town-site entry, and in two or three instances surface ground has been applied for, and its use proved, 250 feet in width on each side of the vein, which was the limit allowed by the rules of the mining district. The present application was filed October 7th, 1878, and publication was made October 17th following. It calls for "1500 linear feet of the Enterprise or Pacific lode, . . . together with surface ground as herein applied for," referring to the accompanying plat and field-notes (Sur. No. 56, executed in August, 1878) for particular description, and setting up an alleged location of the claim on the 19th of March, 1878. The survey shows the vein and surface ground about 1409 feet in length, and 200 feet in width at one end, diminishing, after running a few chains, by offsets exhibiting other claims on either side so as to extend but about 150 feet in width at the other end; the whole embracing 4·33 acres.

The record of location describes the same as "the second northerly extension of the Pacific lode or ledge, . . . commencing at a stake and pile of stones standing 600 feet north of Spring street on line of Pacific lode, running thence north 1500 feet on line of said lode or ledge to a stake and pile of stones standing on Quartz Hill, together with 300 feet on each side of the center of said lode or ledge." No out-boundaries are alleged to have been staked or marked by which to trace the lines of the claim. On the plat of survey filed for patent, no lines are placed showing the crossing of municipal lots, blocks, or streets, nor are any buildings or other objects, except tunnels, shafts, ditches, and two or three fences, noted.

On the 14th of December, 1878, within the period of publication, Batista Papina filed notice of conflict of surface ground to the extent of 1·82 acres, with his improvements, situated on Lot No. 19, Block No. 37, city of Placerville, held by deed from the proper authorities under the town-site patent, and denied the right of Alderson *et al.* to obtain patent to such surface ground or to any claim for mines therein; accompanying his notice with a plat exhibiting the alleged conflict, and copies of his deed dated April 11th, 1874, and of the record of said patent. He further alleged residence and improvement upon the land for upward of nine years, and that, prior to the location in 1878, no mining had within that time been done thereon. The register did not stay the proceedings and refer him to the courts, but seems to have treated the notice as a protest, and on the 30th of December, 1878, forwarded the application for entry to your office without any opinion or recommendation. April 26th, 1880, your office decided that Papina had no standing as an adverse claimant, because the land was subject to no claim, except a mineral claim if in fact mineral, and to entitle him to such recognition he must be actually claiming a vein, lode, or mining claim in opposition to another. You further held that "the town patent conveyed title only to such land as is non-mineral, and an express exception is made of mineral claims. Hence the proper proceeding for Mr. Papina would be to show, if possible, that the land in question is not valuable for minerals." You thereupon dismissed his protest, at the same time offering to permit him to file allegations of the distinctively agricultural character of the land, and to have a hearing upon that point. From this decision he appeals, and the record is now before me. In the mean time, however, it appears that a paper described "as containing evidence in behalf of the mineral applicants," transmitted by the register January 25th, 1879, has been mislaid, and there is no record of what it may have purported to show, upon which to base a judgment, and after being called upon to supply it, the applicants

Digitized by Google

have failed to do so, sending up merely argumentative statements in its stead.

There is also a material discrepancy in the *locus* of the ground as exhibited by the plat filed by the applicants and that filed by Papina to illustrate the conflict alleged, although the latter was made by the same deputy, one J. M. Anderson, who surveyed the claim, and is certified by him as correctly showing the true relative position of the claim with respect to the town lot and adjoining claims. The only questions sharply defined are: 1st. Had the owner of the town lot a right under the law to demand a stay for the purpose of a judicial determination of the right of possession? 2d. To what extent within a patented town-site a lode claimant may be permitted by this department to take surface ground; it being conceded as established by the decisions of this department and of the courts that town-sites may exist upon and embrace mineral lands, subject only to the particular exceptions of law and to vested prior rights. (Rico Case, July 6th, 1882, 9 Copp, 90; Vizina Case, July 11th, 1882, ibid. 92; Mining Company *vs.* Consolidated Mining Company, 102 U. S., 168; Steel *et al. vs.* Smelting Company, October term, 1882.) These questions may be considered together. The deed of Papina from the city contained in the same words as the town-site patent the reservation of mines and valid mining claims. He took, therefore, with express notice of the particular things carved out of the patent in the exact language of the law. This reservation, like the patent itself, had necessary relation to the inception of acquisition of title by the town-site, and its extent must be measured as of that date. All passed to him by his deed not expressly excepted. For Congress, in enlarging the methods of acquisition of title to public lands, provided for towns on the public domain prior to the acquisition of mineral rights. See Stat. of July 1st, 1864 (13 Stat. 343), and March 3d, 1865 (ibid. 529), authorizing the platting of such towns either by "parties" or the Secretary of the Interior, and sale of the lots under certain provisions. The former of these acts made no exception of "mines" or "mining claims;" but the act of 1865, while not excepting "mines," as such, did provide "that where mineral veins are possessed, which possession is recognized by local authority, and to the extent so possessed and recognized, the title to town lots to be acquired shall be subject to such recognized possession and the necessary use thereof." Here was no withholding of title, but only a subjection of the same to a recognized possession and use; and there can be no question that a town lot so conveyed would have passed in fee, with absolute ownership of the vein, upon the cessation or abandonment of the miner's recognized possession. There is nothing incompatible with the grant of the fee, burdened only by the use of an actual occupant by prior possession. And the statute was especially guarded against the idea of any thing beyond a possession and necessary use, by further providing "that nothing contained herein shall be so construed as to recognize any color of title in possessors for mining purposes as against the government of the United States."

The great change which introduced an entirely new system of mining law, differing from that of any existing government, had not then been adopted by Congress. But in the following year, the act of July 26th, 1866 (14 Stat. 251), gave, with certain restrictions, legislative sanction to the laws and customs of "local authority" affecting possessory rights, and the added privilege of acquiring title to the mine itself, under the authority and forms of law. This change gave such rights, even against the government, as required some modification of the town-site provisions, and resulted in the enactments of 1867 and 1868, previously cited, with the express reservations against the acquisition of mines or valid mining claims. And it is to be observed that the exception of such claims by the act of June 8th, 1868, was made with direct reference to towns whose inhabitants, having acquired rights under the act of 1865, should elect to proceed under the act of 1867 instead; although it also enlarged the general exception already expressed in the amended act as to all titles acquired under the town-site entry and patent. But it still left individual lot-owners free to proceed and take title to their own lots, burdened only by the use and possession described in the act of 1865. And it may be further remarked, that the Revised Statutes now contain these several provisions, together with the subsequent amendments of the mining laws. Having now found the order of the law which has first granted the town right, and afterward abridged it only in so far as to admit the new relations presented by the enactment of the mining statutes, the reason of the whole seems to result in this: That, by the acquisition of title to a town-site, no right remains to proceed for patent for mining ground under the reservations of the law, except, 1st. For the mines, with only such incidents of surface ground and the like as are actually necessary to the use and operating of the same; and 2d, For such mine and possessory rights, including surface ground not in excess of that recognized by law at the date of location, as were required by the applicant or his grantors, privies in interest, before the legal inception of the patented town right. But, as with the grant of mines the power to dig them is impliedly given (Shep. Touchet, 89) so by the reservation of mines the power necessary to their enjoyment must be also reserved. And this reservation to and by the government must come under the mining laws to citizens of the United States authorized to explore and possess them, and acquire the government title thereto (Maxwell on Interpretation, 319). If, then, an applicant, as in this case, seeks to acquire patent for a mine (lode or vein) within a patented town-site, based upon a location subsequent to such patent, he must be required to show affirmatively the existence of such mine and its true location, and prove his possessory right and value of work performed, as in other applications. He will not, however, be permitted to proceed as for a claim with surface ground limited only by the usual statutory restrictions as to width along the vein, but will only be allowed to claim the necessary surface ground for the convenient working of his mine; in no case in excess of the legal width at date of the town-site appropriation. His plat must distinctly show the ground so claimed with relation to all other claims, and the occupation and improvement of others, whether municipal or otherwise, and proof of such necessary possession and use must be furnished sufficient to make a clear *prima-facie* showing of his right (Steele *vs.* Smelting Company, *supra*). If such showing be made, he may proceed to publication, and, if no adverse claim is filed, may obtain his patent, containing the usual town-site reservations, for the protection of any interests previously acquired. Should a lot-owner elect to come forward denying the applicant's right to the possession, while it may not yet be incumbent upon him to do so in order to preserve his own previously acquired rights of priority under his patent, I see no objection to permitting him to set up his own title and allegations of possession as an adverse claim, and have a stay of proceedings for the statutory period, to enable him to go into court for the settlement of the matter before the issuing of the mining patent. This is a question of the right of possession which may properly, in harmony with my decision in the Rico case, determine all the issues involved, and if the town-lot owner sees fit to assume the burden of suit, he should have that right. The applicant can not complain. He is only placed upon the same footing with other applicants on the public lands, and it may result that the finding of the court will conclude the matter in favor of the town-site title, in which case the confusion resulting from a wrongful issue of patent will be prevented. That town-site occupants may be adverse claimants within the meaning of the mining statute was decided by this department upon reasons stated in the case of Becker *vs.* Citizens of Central City, August 7th, 1871. Should the mining claimant, in addition to the mine, claim surface ground, based upon possession and location prior to entry of the town-site, he must show affirmatively the facts relating to such location and possession, and his own priority with the possessory title, and upon such showing he may proceed. His plat must show, as in the preceding case, every thing necessary to exhibit the true character and location of all improvements, and he must be restricted to the limit as to width established by the local laws at date of town-site entry. The application of Alderson *et al.* for the Enterprise mine being notoriously lacking in the preliminary requirements, must be dismissed, without prejudice to his right to proceed *de novo* on compliance with these conditions, and your decision dismissing the protest of Papina is accordingly reversed.

THE SIEMENS DIRECT PROCESS.

Mr. James Davis, manager of the New Steel-Works, London, has communicated the following particulars of the working in the Siemens direct rotatory furnace of the separated magnetic iron-sand from Moisic, Canada, that was sent to these works to be experimented upon, to ascertain the best mixture and most suitable temperature for working this material in the rotator. After various trial charges, it was found that a charge of 25 cwt. of magnetic iron-sand, mixed with 6 cwt. of coal or charcoal, gave the best results. The average time required in the rotator was 3 hours 45 minutes, and the yield of solid metallic balls was 15 cwt. 3 qrs. The reduction of the magnetic iron to the metallic state took place very easily; in fact, he reports that it is the best material for working in the rotator that he has seen so far. One of the balls made with coal was roughly hammered out into a billet, which on analysis gave:

Metallic iron	96·950	Sulphur	0·030
Slag and silicon	3·040	Manganese	Trace.
Carbonaceous matter	0·170		
Phosphorus	0·002		100·19

One of the billets made from a charge reduced with charcoal was afterward reheated and simply rolled into a finished bar without piling and reheating (as is usually done), and gave an analysis as follows:

Metallic iron	95·77	Manganese	Trace.
Slag	3·91	Carbon	0·11
Sulphur	0·02		
Phosphorus	0·02		99·83

The tensile strain of this bar was 21·5 tons per square inch, with 23 per cent elongation. Most of the balls made were taken straight from the rotator, and used in the Siemens furnace for the production of mild steel; they were found to be very suitable for this purpose, and gave excellent results. There would be no difficulty in getting six charges, or about five tons per day of balls out of such a rotator when working with this magnetic iron-sand, which would be a weekly make of at least 30 tons per rotator. Working the rotator in pairs, the wages would come to about 5s. per ton on the rough balls. The fuel required for the Siemens gas-producer to heat the rotator is as nearly as possible one ton per ton of balls produced. Generally speaking, the magnetic iron-sand appears to me peculiarly well adapted for the production directly of a very fine quality of steel or iron in the Siemens rotatory furnace, and if it can be cheaply obtained, should yield a very handsome profit in working.

UNDERGROUND ELECTRIC WIRES.—At the meeting of representatives of telegraph and electrical companies to consider the subject of underground electrical communication, it was resolved to appoint a general committee to take charge of and push the matter. This committee has organized by the election of J. P. Davis, Chairman; R. W. Blackwell, Treasurer; and W. C. Behrens, Secretary. A committee consisting of Mr. Davis, Col. R. R. Hazard, and F. H. May was appointed to nominate permanent sub-committees on electrical and mechanical devices, law and franchises, and business organization.

THE EDISON LIGHTS IN EUROPE.—According to a report read at a meeting of the stockholders of the Edison Electric Light Company of Europe, Limited, there are in France 32 plants of the company with 2680 lights; in Italy, 11 plants with 5777 lights; in Germany, 28 plants with 3667 lights; in Holland, 4 plants with 1648 lights; in Austria, 7 plants with 1724 lights; in Russia, 14 plants with 2772 lights; and in Belgium, 12 plants, with 1268 lights. A subordinate company has been formed in Germany, and the interests of the Edison and Siemens lights have been consolidated under the name of the Edison Electric Light Company of Germany. The capital of the company is 5,000,000 marks. The capital of the General European Company is $2,000,000. The subordinate company recently formed in Italy has a capital of 3,000,000 francs. It was stated that an Edison factory, similar to those in this country, had been established in Italy, for manufacturing dynamo lamps, underground conductors, meters, and other apparatus for use by the European Company, exclusive of Germany, where the Siemens and Edison companies manufacture apparatus under separate licenses. A company has just been formed to introduce central station lighting in Paris on a large scale, and a central station similar to the one in Pearl street will be built. A central station is also starting in Milan, Italy, where La Scala Opera-House is lighted by Edison lamps.

THE SILVER KING MINE.*

By Prof. William P. Blake.

(*Continued from page* 239.)

Geology.—The geological structure of the Pinal region is somewhat complex, but is very interesting. The whole country appears to have been covered, in comparatively recent geological time, with volcanic rocks, partly in a sedimentary form, as volcanic sandstones and conglomerates, and partly and lastly, in a molten or lava-form. Considerable areas of these rocks have been swept away by denudation and erosion, leaving the older and foundation rocks exposed to view, particularly in the valleys and cañons, while remnants of the lava-flow cap the summits and in places remain as flat-topped mountains; as, for example, the mountain known as Tordilla, at Pinal, back of the mill.

The Pinal range, above the Silver King mine, is formed chiefly of Paleozoic strata, with heavy beds of quartzite at the base, overlain by massive limestones dipping eastwardly. These strata show along the Stoneman Grade as it ascends the mountain, and can be seen in greater thickness, probably not less than 3000 feet, by ascending Queen Creek farther to the southwest. Several miles farther southwest, toward the Gila, the same series of limestones crops out in mountain masses, pitching at a higher angle eastward, and in some of the upper beds spirifers have been found, which I refer to the Coal Measure series of the Carboniferous formation. In some places, there is a large development of a coarse conglomerate of a red color.

Above the limestones at the King Mountain, as I denominate the highest summit above the mine, the volcanic outflows which form the capping consist largely of pitchstone porphyry carrying obsidian, geodes of quartz crystals, masses of chalcedony and of semi-opal.

Below the limestone and quartzite series, gneissic and hornblendic grained mica slate formation. This formation is very ancient, and is lithologically and to all appearance the equivalent of the Taconic slates of Berkshire, Massachusetts, and the Vermont extensions. It is extensively developed in Arizona, and being one of the primal series of formations and fundamental bed-rocks of the territory, in and upon which such a variety of later formations are grouped, it deserves the distinguishing name of Arizonian slate, which I shall apply to it. It is extensively exposed to view along the sides of the Queen Creek Valley, west of the town of Pinal, where it may be seen in a highly contorted, twisted condition, traversed by innumerable veins of white quartz, also contorted, and often doubled back and forth upon themselves. This slate extends to the southwest, flanking the granitic masses of the Pinal range, and is there much traversed and broken up by granitic intrusions. This rock finally disappears, westward, under the post-tertiary formations of the Gila plains.

The sequence of the formations thus briefly noticed is shown on the appended sketch-section representing the summit of King Peak westward to the Gila plain. The central portion of the Arizonian slate is concealed from view by the horizontal sediments of Tordilla Mountain, opposite Pinal, but it crops out along the valley below it. About seven miles below Pinal, the slate is penetrated by granitic intrusions, and is gradually replaced by granite.

The lower portion of Tordilla Mountain is formed of regular layers of compact white sandstone. It is suitable for building-stone, and is quarried for that purpose. The same formation is developed along the Gila, but is there, in some places, tilted up at considerable angles.

The Vein Formation.—The observer, standing upon the highest point of the Silver King location, the initial point of the mine and of Pioneer District, looks below to the westward into the large open pit or excavation, the result of the first working of the mine from the surface downward. This pit measures, approximately, 115 feet long by 92 feet wide

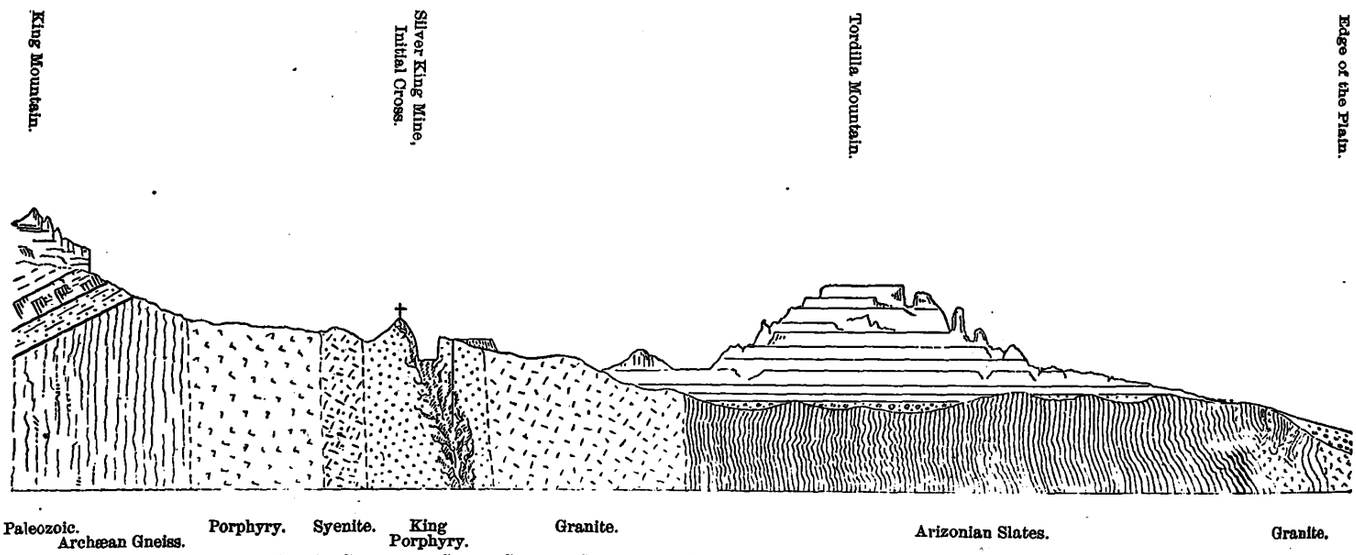

FIG. 1.—GEOLOGICAL SKETCH-SECTION, SILVER KING PEAK TO THE PLAIN, OVER THE SILVER KING MINE.

rocks of the Archæan age crop out and appear to be the foundation rocks on which the sediments rest unconformably. Still lower down the slope, the rocks become syenitic, and are then replaced by a distinctly-formed feldspar porphyry, with small white feldspar crystals, and an abundance of iron pyrites finely disseminated. The formation appears to have the position of a dike, cutting the other rocks, but it is extensive, and continues to and beyond the Silver King mine. It may be regarded as the inclosing rock of the Silver King, although in one place, some 200 feet above the mine, there is a strongly-defined outcrop of a dense, hard porphyry with hornblende crystals and brilliant glassy feldspar forming a syenitic porphyry.

At the mine, and in it, the porphyritic structure generally becomes obliterated and the rock has more the appearance of a granular quartzite with a large amount of earthy admixture, and obscure fragmentary crystals of silvery mica. Examined alone, it would pass as a quartzite containing much clay and iron protoxide. In some places, it is almost colorless, white and earthy, soft, easily cut or crushed, but shows distinct grains of quartz as large as peas. The larger portion of the rock below the open cut has a dark, greenish color, and is known by the miners as "dark porphyry." In some places, it appears to be chloritic. This, with the light porphyry, is the ore-bearing rock of the mine. It is penetrated, as will be shown in detail in the following pages, by veinlets of quartz and by ore.

After carefully studying the rock in place and its environment by the unaltered crystalline porphyry, I am led to the conclusion that the rock of the mine is an altered porphyry, changed in its place contiguous to the solfataric outflow, the principal portion of the silica of the feldspar having been removed, going, perhaps, to form the veinstone of the ore. If, as seems probable, the rocks originally were charged with disseminated pyrites, as seen at some distance from the mine, it is now largely removed, and the pyrites may have exerted an important function in the precipitation of the ore as we now find it concentrated in veinlets and bunches. The altered porphyry appears to contain more iron protoxide than the unchanged rock. The feldspar porphyry below the mine is succeeded by a fine-grained gray granite, in places syenitic, and this again lower down the slope, toward the plain, by an extensively developed fine-

and 120 feet in depth. It marks very nearly the limits of the ore-bearing ground, so far as it is yet known or developed at the surface and near it. The portions removed consisted largely of rock, the porphyry, so-called, penetrated and seamed with interlacing veinlets of quartz, reticulating and crossing in every direction. These veinlets varied from the thickness of a sheet of paper to one quarter of an inch or an inch in thickness, and were generally accompanied with ore in a medial position, having quartz on each side of it next to the rock. The same conditions may be seen in the lower levels at the present time. In addition to these veinlets, there are masses and bunches of ore, and apparently (at least in the upper levels) a central mass of quartz, a large and compact body, toward which the system of veinlets converged, or from which they may be said to radiate. This mass of quartz, of irregular dimensions, still exists in the region opened by the lowest levels of the mine, but it has not yet been thoroughly explored. This quartz appears to hold some direct relation to the deposition of the ore; the heavier bodies of ore, so far, having been cut below, or on the foot-wall side of the quartz body. It may be regarded as holding the relation of the chief veinstone to the ore, and as presenting within itself, and together with the branching veinlets, the characters of a true fissure-filling, although it has not the usual sheet-like or tabular form. It is, instead, a columnar or chimney-like mass, some eighty feet in diameter in places, but irregular and without longitudinal extension. In other words, this quartz-vein, instead of forming a sheet-like mass or filling between parallel walls, with a length much greater than its breadth, is approximately *cylindrical* or columnar in its form, filling a nearly vertical, spirally-formed cavity, as if it had risen as smoke rises in a chimney, but circling about through the riven rocks until it reached the surface by many outlets.

Without here discussing the various theories which might be advanced to account for this peculiar impregnation of the rocks with rich ores of silver; whether the flow was from above downward, or the reverse, whether the quartz with the associated metals was extruded from the surrounding rock and found lodgment by replacement, or whether it was diffused by the penetration of fissures by solutions or gases, I prefer to adopt the explanation that there was an upward flow of heated water and steam which carried the metals into the fissures and left them there. The conditions as we find them are most clearly explained upon this hypothesis, and I believe are most vividly and truthfully repre-

Digitized by Google

sented to the mind by this conception, of an upward flow of thermal water along a main central channel, like that of a deep-seated spring or geyser, now an extinct argentiferous solfatara.

If we examine the structure of the veinlets in detail, we find them presenting the characteristics of fissure-veins. They extend for long distances through the rocks and with parallel walls. They have regular veinstone and vein structure. The quartz forms on the opposite walls of the fissures in regular sheets, with "combs" or quartz crystals pointing inward and holding the ore in bunches and sheets. Such inclusions of ore are still to be seen in the small veins at the summit of the croppings and in the levels below.

Some of the various forms under which the ores present themselves in the mine, and the sequence or order of deposition of the minerals, may be shown to best advantage by a few illustrative sketches and sections of the veins.

1 2 3 4 3a 2a 1a

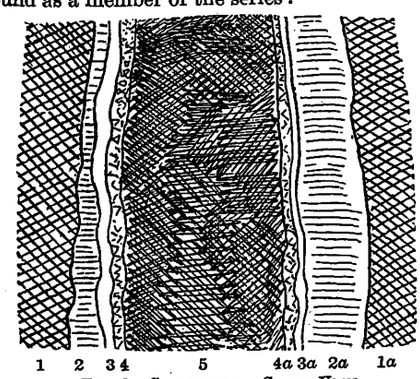

FIG. 2.—SECTION OF A VEIN, SHOWING THE STRUCTURE.

1. Porphyry.
2. Compact quartz.
3. White crystalline quartz.
4. Ore filling, consisting of sphalerite, galenite, and native silver, with some vuggs or cavities containing crystals of light-colored blende. Some irregular fragments of altered porphyry are inclosed in the midst of the vein.

3a. White crystalline quartz.
2a. Compact quartz.
1a. Porphyry.

Figure 2, of one half the natural size of the specimen, shows a veinlet about four inches wide in the light-colored porphyry. We find first, next to the rock, a lining on each side of compact quartz, succeeded by white crystalline quartz and the ore, in the succession indicated.

Fig. 3. Section of a veinlet in dark porphyry carrying about two inches of dark-colored sphalerite (blende), confusedly crystallized. The paragenesis is as follows, and is chiefly remarkable for the brown-spar, which is not often found as a member of the series:

1 2 3 4 5 4a 3a 2a 1a

FIG. 3.—SECTION OF A SMALL VEIN.

1. Porphyry.
2. Compact quartz.
3. White quartz.
4. Brown-spar or iron-spar with disseminated pyrites.
5. Central filling of compact ore. Blende chiefly.

4a. Brown-spar and pyrites.
3a. White quartz.
2a. Compact quartz.
1a. Porphyry.

Another fragment of a veinlet shows quartz more distinctly crystalline, with some copper pyrites between it and the porphyry, and a central ore-filling of massive blende and galena mingled together.

The ore occurs also in bunches in the rock with but little veinstone. A tendency to triangular forms is observable, and in several places I have noted veins joining together nearly at right angles, somewhat as shown by the figure annexed.

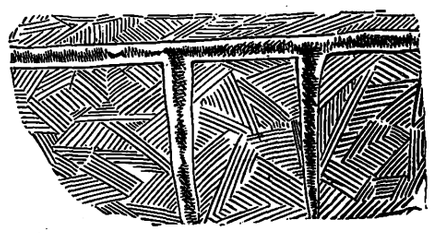

FIG. 4.—EXAMPLE OF RETICULATION OF SMALL VEINS, BRANCHING FROM ONE SIDE IN THE GREEN "PORPHYRY."

This is an example of reticulation but not of crossing. The latter form is, however, common, and may frequently be found in the masses of ore as sent out from the stopes, or better in the freshly broken faces of the stopes. But irregularity of branching is the rule rather than any geometrical or symmetrical arrangement. The various appearances presented justify liberal illustrations, and I would be glad to add a few photographs of some blocks of the ore-bearing porphyry as taken from the dump.

The reticulation of the veins is seen to the best advantage at the surface, and particularly at the summit. There is at that point a very interesting example within the space of a few square feet, showing apparently two systems of veins of different ages, one system with a true north and south strike, and the other system having an east and west strike. They intersect at right angles, as shown on the appended sketch, from a drawing made upon the spot, and curiously at this initial point they form a true

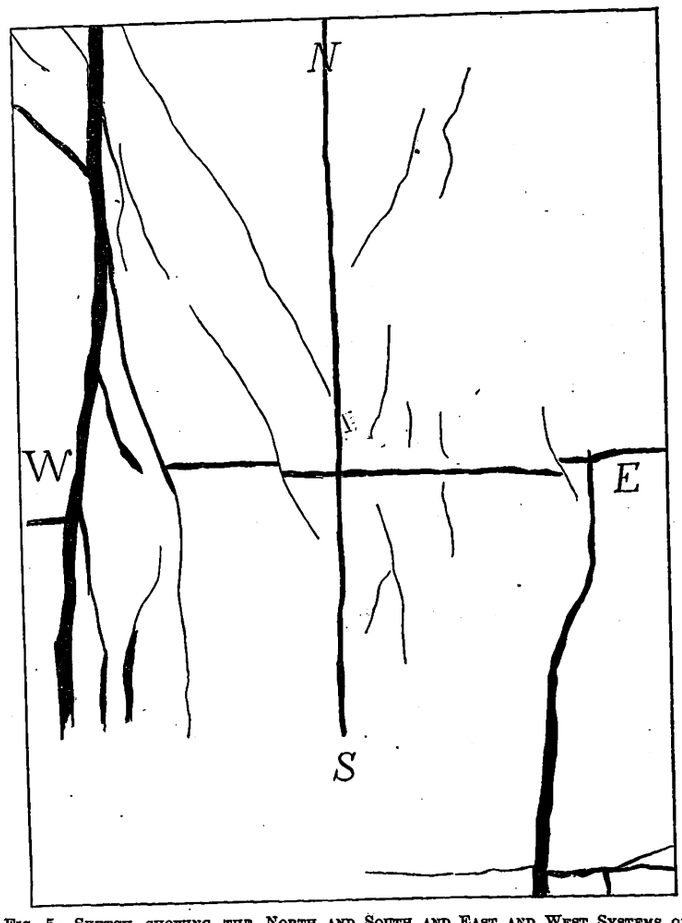

FIG. 5.—SKETCH SHOWING THE NORTH AND SOUTH AND EAST AND WEST SYSTEMS OF VEINLETS, FORMING A CROSS AT THE SUMMIT OF SILVER KING MINE.

right-angled *cross*, the arms of which point north and south, east and west, marking in a very appropriate manner the center of the district. I have deemed it worthy of a diagram or plat, illustrating, as it does, the reticulation of the veins and the complete mineralization of the mass of the rock. The east and west fissuring appears to be the older of the two, for the veinlets of that direction are cut through and are faulted for a short distance by the north and south veinlets.

It will be inferred from the preceding descriptions that the richest and most important accumulations of ore are not found in the main body of the quartz veinstone. Although the massive quartz does hold bunches of rich ore, it is not, as a rule, so rich and profitable to work as the rock adjoining it. The ore is more abundant in connection with the small branching veins in the outside rock than in the mass of the quartz itself. It must, however, be stated that the quartz body has not yet been fully explored, being merely cross-cut in the upper levels. It is my opinion, however, based upon what has already been shown, that, contrary to the usual conditions in mines, the chief body of quartz veinstone does not carry the best part of the ore. It appears rather to have been the main channel of the mineralization; the main artery or feeder to the thousands of veinlets branching from it into the wall-rock, following the clefts and

Digitized by Google

penetrating the substance of the rock, depositing and diffusing native silver and the sulphides throughout the whole mass of rock for an indeterminate distance on each side.

So far as explorations have extended, no distinct boundary line or wall to the ore has been found. The silver solutions appear to have found a congenial resting-place in the midst of the rock. We have, as the result, a form of mineral impregnation which may be classed as "*stockwork*," this name having been given to masses of rock so mineralized by small veins ramifying through them that they require to be mined *en masse*, and give broad excavations known as "*floors*." These are precisely the conditions found in the Silver King. The whole of the impregnated rock is blasted out and sent to the surface with but little selection or sorting. The "porphyry" and the veinlets go together and are crushed together, it being impossible to separate all the ore from the rock by sorting.

This extensive and varied mineralization, connected, as it appears to be, with a central solfataric mass of quartz, gives good evidence of being deep-seated. It is evidently not superficial, but has the appearance of a lasting ore-channel of great depth. There is no evidence of any weakening of the mineralization at the lowest level reached; on the contrary, the lowest level is the largest yet opened except the Open Pit at the surface. The veinlets can not be traced far on the surface, and it is difficult to show that they extend more in one direction than another. The formation seems to have a general dip to the westward, and this is the direction of the underlie of the ore-ground, as is shown in the chapter upon development.

The solid white quartz of the upper levels has not yet been fully explored. It contains rich bunches of gray copper ore, generally in a very friable condition, almost in black powder, but rich in silver.

(TO BE CONTINUED.)

THE ESTIMATION OF ARSENIC.

Written for the Engineering and Mining Journal by O. J. Frost, Argo, Colo.

Mr. Richard Pearce, of the Boston & Colorado Smelting Company, Argo, Colo., has long felt the need of a rapid and reliable method for the estimation of arsenic in ores and metallurgical products, and more particularly in copper ores and copper smelting products. After a great many experiments in different directions, the following scheme, depending on the insolubility, under certain conditions, of silver arseniate in neutral solutions, has been found to work well. It was described by him in a paper read before the Colorado Scientific Society.

The finely-powdered substance for analysis is mixed in a large porcelain crucible with from six to ten times its weight of a mixture of equal parts of carbonate of sodium and nitrate of potassium. The mass is then heated with a gradually increasing temperature to fusion, and kept for a few minutes in that state. It is then allowed to cool, and the soluble portion is extracted by warming with water in the crucible, and filtering from the insoluble residue when disintegration is complete. The arsenic is in the filtrate as alkaline arseniate. The solution is acidified with nitric acid and boiled to expel carbonic acid and nitrous fumes. It is then cooled to the ordinary temperature, and almost exactly neutralized as follows: Place a small piece of litmus paper in the liquid: it should show an acid reaction. Now gradually add strong ammonia till the litmus turns blue, avoiding a great excess. Again make slightly acid with a drop or two of strong nitric acid; and then, by means of very dilute ammonia and nitric acid, added drop by drop, bring the solution to such a condition that the litmus paper, after having previously been reddened, will, in the course of half a minute, begin to show signs of alkalinity. The litmus paper may now be removed and washed, and the solution, if tolerably clear, is ready for the addition of nitrate of silver. If the neutralization has caused much of a precipitate (alumina, etc.), it is best to filter it off at once, to render the subsequent filtration and washing of the arseniate of silver easier.

A solution of nitrate of silver (of neutral reaction) is now added in slight excess; and after stirring a moment, to partially coagulate the precipitated arseniate, which is of a brick-red color, the liquid is filtered, and the precipitate is washed with cold water. The filtrate is then tested with nitrate of silver and dilute nitric acid and ammonia, to see that the precipitation is complete.

The object is now to determine the amount of silver in the precipitated arseniate of silver, and from this to calculate the arsenic. Two methods may be employed, the conveniences of a laboratory determining which is preferable: (1) The arseniate of silver may be subjected to scorification (or fusion) and subsequent cupellation. This necessitates the removal, earlier in the process, of any soluble chloride present. (2) The arseniate of silver may be dissolved on the filter with dilute nitric acid (which leaves undissolved any chloride of silver) and the filtrate titrated, after the addition of ferric nitrate or sulphate, with sulphocyanate of ammonium. About five cubic centimeters of a saturated solution of ferric-ammonio-sulphate are added, and the standardized sulphocyanate solution (about five grams to the liter) run in until a faint red tinge is obtained, which remains after considerable shaking. The shaking breaks up the clots of sulphocyanate of silver and frees any solution held mechanically.

From the formula $3Ag_2O.As_2O_5$, we deduce 648 parts Ag = 150 parts As, or Ag : As = 108 : 25:

	As. Per cent.
1-10 of a gram of a sample enargite tested by this method gave	19·036
A second trial showed	19·090
To try the effect of antimony, 1-10 of a gram of the enargite was mixed with an equal weight of stibnite and tested; the result was	19·130
The arsenic in the enargite determined by the arseniate of magnesia and ammonia method showed	19·440
A sample of copper glance was tested, and found free from arsenic. This was then added in sufficient quantity to the enargite to produce a mixture calculated to contain	0·370
0·55 gram was taken for analysis and showed	0·380
A test on 1-20 of a gram of pure proustite gave	15·080
Theoretical	15·150
A sample of copper matte gave first trial	0·470
Second trial	0·460
Another sample of copper matte gave, on first trial	0·280
Second trial	0·284
A sample "pimple" metal gave	0.458
Repeated	0.459

Additional experiments have been equally satisfactory.

This method for the estimation of arsenic is not only accurate, it is short also. By process (2) an estimation can easily be made in half an hour; and an estimation has been made by Mr. A. H. Low in the laboratory of the Boston & Colorado Smelting Company at Argo, where the details of the process were worked out in twenty-two minutes.

Owing to the large amount of arseniate of silver formed from a small quantity of arsenic (nearly six times by weight), it is not at all necessary or even desirable to work with large amounts of substance. Half a gram is usually sufficient for the determination of the smallest quantity of arsenic; and where the percentage is high, as little as one tenth or one twentieth of a gram may be taken with advantage. The method has been used with very satisfactory results on the sulphide of arsenic obtained in the ordinary course of analysis.

Substances such as molybdic and phosphoric acids, which may behave similarly to arsenic under this treatment, interfere, of course, with the method. Antimony, by forming antimoniate of sodium, remains practically insoluble and without effect.

It is quite probable that the method could be adapted for the rapid estimation of phosphorus in commercial products and in iron and steel; but beyond a few preliminary experiments, nothing has been attempted in this direction.

THE POWER OF EXPLOSIVES.

The dynamite scare in England has led to the publication in the English journals of a number of letters on the power of explosives, from which we choose the following written by Mr. George M. Roberts, the technical manager of Nobel's Explosive Company, Limited, who writes:

Nitro-glycerine and dynamite do not, when exploded, exert such a force as is popularly believed. To speak precisely, the power developed by the explosion of a ton of dynamite is equal to 45,675 tons raised 1 foot, or 45,675 foot-tons. One ton of nitro-glycerine similarly exploded will exert a power of 64,452 foot-tons, and 1 ton of blasting gelatine similarly exploded, 71,050 foot-tons. These figures, although large, are not enormous, and need not excite terror. Seventy-one thousand tons of ordinary building-stone, if arranged in the form of a cube, would measure only 96 feet on the side, and if it were possible to concentrate the whole force of a ton of blasting gelatine at the moment of explosion on such a mass, the only effect would be to lift it to the hight of a foot. The foregoing figures are derived from experiments made at Ardeer with an instrument which gives accurate results in measuring the force of explosives. The power exerted by an explosion on surrounding objects is in the inverse ratio of the cube of the distance from the point of explosion. Thus, at 100 feet from the exact point of an explosion, the power is only the cube of 1-100, or 1-1,000,000th part of what it is at a distance of only 1 foot from that point; or, in other words, if the power at 1 foot from the spot be represented by 1,000,000, at the distance of 100 feet it will be but 1. It is thus seen that the effects are intense locally, but comparatively trifling at even short distances. If a ton of dynamite or nitro-glycerine were exploded in a London street, the effects would be felt severely in the immediate neighborhood only of the explosion, and beyond that they would be confined to the mere breakage of windows. Indeed, it would be impossible by a single explosion, however large, to do damage to any considerable extent beyond the immediate neighborhood in which the explosion took place. On one occasion, I happened to witness the explosion of over a ton of nitro-glycerine from a distance of only 60 yards. The nitro-glycerine was about 10 feet beneath the level of the ground, which was of sand and covered with water. Beyond the breakage of windows and the bursting of a few doors in the surrounding buildings, there was no damage done. A little sand was thrown over me, but I received no personal injury. Vague statements have been made from time to time, promulgated to induce the belief that there are stronger explosives than nitro-glycerine and nitro-glycerine preparations, and that the wretched men who have been guilty of the late attempts on public buildings, etc., are in possession of more powerful explosives than any known to chemists. The public may rest assured that such is not the case. Nitro-glycerine and its preparations form the strongest explosives yet known. The strongest of these is the material known as blasting gelatine. It consists of nitro-glycerine combined with a certain proportion of nitrated cotton. It is much more difficult to prepare than either nitro-glycerine or dynamite, and can not be made by unskilled persons. If the power of dynamite be represented by 1000, that of nitro-glycerine will be 1411, and of blasting gelatine 1555. The 1¼ cwt. of nitro-glycerine seized by the police the other day would, if exploded, exert a force of only 4833 foot-tons, and if converted into dynamite it would represent a force of only 4567 foot-tons. The conversion of nitro-glycerine into dynamite reduces the power of the former, but renders it more easy and safe to handle and use. The power given above is comparatively insignificant, and as it is the maximum effect that could be produced under the most favorable circumstances on the very spot of explosion, it never could be obtained in practice. It is therefore absurd to say, as was said the other day in a London paper, that the explosion of such a quantity of nitro-glycerine would blow up the whole of London. In fact, the explosion could scarcely be heard over London, and the damage done by it would be strictly local. I have often, by way of experiment, exploded one pound of dynamite suspended from the end of a fishing-rod by a string about six feet long, holding the rod in my hand the while. As there was no solid matter to project, I received no injury, and the end of the fishing-rod was not even scratched. About three feet of the string at the end of the rod was always left uninjured.

THE CONSOLIDATION OF THE ELECTRIC RAILROAD PATENTS.—Negotiations with a view of consolidating the electric motor patents of Edison and Stephen D. Field have been going on for the last month, and resulted in the signing of contracts by both parties, which put an end to the fight and give the patents into the control of a new company. On the basis of the use of both sets of patents, a company is to be formed, with a capital of $2,000,000, for the purpose of operating electric railroads in the United States. This basis was decided upon after the value of the patents had been placed at the sum named by a committee of estimate appointed for the purpose, whose chairman was Prof. George F. Barker, of the University of Pennsylvania.

THE PRODUCTION OF COAL, ORES, AND METALS IN GERMANY IN 1882.

A preliminary statement has been published, giving the production in Germany of coal, ores, iron, and metals. The reports are not quite complete; but as our third column, giving the production in 1882 of works from which no returns were as yet received for 1881 will show, the missing figures are insignificant. The unit is the metric ton, except when elsewhere specified:

	1882.	1881.	Not reported.
Coal	52,094,895	48,677,140	11,021

FURNACE, MILL, AND FACTORY.

The Knowles Steam Pump Works has changed the location of their salesroom from No. 86 Liberty street to No. 93 Liberty street, nearly opposite their old headquarters.

The George F. Blake Manufacturing Company announces that it has secured the large and commodious ware-rooms Nos. 95 and 97 Liberty street, to which it has moved from No. 83 Liberty street.

Messrs. Sperry & Co., manufacturers of mining machinery, of No. 12 Cortlandt street, this city, have issued a new catalogue, in which they illustrate stamp-mills, portable engines, tubular boilers, turbines, hoisting-engines, pumps, pipes, the Hoskin little giant, crushers, rolls, pans, settlers, ore-feeders, water-jacket furnaces, concentrators, skips, cages, buckets, blowers, rock-drills, compressors, horse whims, and cars. We note several specialties designed by Mr. Coleman.

The Selden steam-packing, manufactured by Mr. Randolph Brandt, of No. 534 Water street, this city, has been quite generally adopted by pump and engine builders, rods packed with it having been running for years without scratching them. Mr. Brandt has also brought out a safety lubricating compound for use on journals and crank-pins. It is applied through cups with a copper wire in the hole to act as a conductor of heat from the journal to the lubricant and feed only sufficient to keep the bearing thoroughly oiled.

Messrs. Riter & Conley, of Pittsburg, have just got in operation two machines for flanging boiler-heads, lately patented by Mr. A. Wilbur, of Alleghany, one for the outside flange and the other for inside flue-holes.

The Pittsburg Tool Company has purchased the business and machinery of Alker & Cromlish, which it proposes to remove to its works on the corner of North and Irwin avenues, Alleghany, where it will erect a building for the accommodation of the same. This company has largely increased its capacity for the manufacture of machinist tools, set and cap screws, and finished machine bolts.

The Philadelphia & Reading Railroad Company will erect new shops in Pottsville this summer. The *Miners' Journal* says that the erection will be begun without delay. Ground will be broken at an early day, and the work will be pushed forward to completion as expeditiously as possible. These works will be equipped with a plant adapted to the production of every variety of tools and manufactured supplies required for the operation of the Coal and Iron Company, as well as many of the requisites of the Railroad Company.

A company chiefly composed of Pennsylvania iron men has secured the Lawler iron ore mines in Page County, Va., and will erect a furnace on the property. One hundred and fifty thousand dollars have been subscribed for the purpose of pressing actively the work upon which the company has entered.

Topton furnace of Topton, Pa., will blow out for repairs.

J. A. Gilkerson's new machine-shop at Homer, N. Y., has been started up. The main building is 30 by 84 feet; engine-house, 16 by 24 feet; and blacksmith-shop, 12 by 12 feet. The productions will be light special machinery, steam-pumps, hand and power drills, Gilkerson's automatic screw slotting machines, and special tools.

C. G. Hussey & Co., Pittsburg, have been awarded the contract for supplying sheet-copper for the Custom-House at Memphis, at twenty-nine cents for twelve-ounce copper, and twenty-seven and a half cents for fourteen-ounce copper.

The Struthers furnace, located east of Youngstown, Ohio, has been leased by Receiver Brown, of Brown, Bonnell & Co., to the Brier Hill Iron and Coal Company, which has taken possession. It was damped down in February; prior to that time, it had been producing 125 tons of pig-metal per day.

The Blakeney Foundry Company, Springfield, Ohio, is erecting a foundry, 60 by 110 feet, and a machine-shop 48 by 102 feet. It will make the Blakeney cupola furnace. It is expected that work will begin about June 1st, with a hundred men.

The Ingersoll Rock-Drill Company has moved from its old quarters, which it had for so many years occupied at No. 1 Park Place, to the more commodious and spacious warerooms at No. 10 in the same street in this city. We are informed that the ever-increasing business done by this company in the manufacture and sale of its well-known rock-drill and air-compressors has of late taken such proportions that the space and facilities of its old office became entirely inadequate to meet the requirements of its trade, and a change to larger quarters was decided upon as a matter of absolute necessity. Aside from the increased comfort and convenience, the main feature of the company's new ware-rooms at 10 Park Place will be the display of a full line of the goods it manufactures and handles, such as rock-drills, air-compressors, hoisting machines, diamond core prospecting-drills, electric blasting batteries, and general mining and rock-excavating machinery; some of it in motion, so that visitors and intending purchasers may get a better idea of the construction and mode of working of the different machines. Simultaneously with its removal, the company has issued a new and handsome catalogue of 90 pages, full of illustrations and information of interest to all who are engaged in mining, quarrying, and all kinds of rock-work, for which the machinery sold by this company is specially adapted. Among work now in the hands of the Ingersoll Rock-Drill Company we may mention a complete plant of twenty drills, duplex air-compressor 21-inch by 42-inch cylinders, three 70 horse-power boilers, etc., for the Cornwall Ore Bank Company, of Pennsylvania, also ten complete drill and compressor plants for mines in New York and New Mexico. We learn that this company's new style of improved air-compressor is giving most satisfactory results. No change has been made in the location of the shops up-town; but even there, larger space had to be added and extensions made, in order to increase the manufacturing facilities, and thus keep pace with the demand. One hundred men are now constantly employed at the shops.

The great driving-rope which is to pull the cars across the Brooklyn Bridge has arrived at the wharf adjoining the Fulton Ferry from the J. A. Roebling Company's Wire-Works, Trenton, N. J. It is 1½ inches in diameter, 11,700 feet long, and weighs 19 tons. It is accompanied by a duplicate rope of the same weight and strength, which is to be held in reserve for use when the first rope wears out. Col. William H. Paine, in speaking of it to a reporter of the *Eagle*, said: "In all my experience, I have never seen a rope to equal it in manufacture; for the wire seems to be perfect, and the test which it has been subjected to gives ample assurance of its strength. Before it left the works, every wire held at least 1000 pounds and was stretched from four to six per cent more. The tarring observable on the surface is for the purpose of protecting it from the atmosphere and also to give the interior a kind of lubrication when it comes to be used."

A correspondent of the *Bulletin* sends the following item of interest: "The blowing-engine built by the I. P. Morris Company for the Crown Point Iron Company blows 13 pounds of blast with 14 pounds of steam, and gives entire satisfaction. With the old engines blowing eight pounds, steam goes down; but with the new engines blowing eight pounds, steam goes up rapidly and blows off.

It is reported that Amasa Stone, D. P. Eels, Col. W. H. Harris, C. A. Otis, and various other Cleveland stockholders of Brown, Bonnell & Co., have made a proposition to the creditors that they will organize a stock company with a capital of $1,000,000, take all the property of Brown, Bonnell & Co., and pay off the indebtedness in annual payments in four years, with interest at six per cent. The gentlemen whose names are mentioned above will have no trouble in carrying out their agreement if it is accepted. In many cases, it is believed that the creditors would accept stock in the new concern for their accounts.

The Pneumatic Pulverizer Company, of this city, has removed its offices to the Merchants' Building, Nos. 2 and 4 Stone street.

The St. Alban's Iron and Steel Mills, St. Alban's, Vt., have filed a petition of insolvency. The schedule filed shows liabilities of $505,000 and assets of $497,000. Boston and New York creditors are interested only in small amounts. A meeting will be held May 11th, to choose an assignee.

The Harrington & King Perforating Company has purchased the plant and succeeded to the business of the Harrington & Oglesby Company, of Chicago. It has new and improved machinery.

Mr. C. L. Dahler, President of the Virginia City Reduction Company, Virginia City, Montana, has ordered a concentrating mill of 25 tons daily capacity from the Fort Scott Foundry and Machine Works, Fort Scott, Kansas. It is reported also that the Hecla Consolidated Mining Company, of Glendale, will double the capacity of its 150-ton mill, built by the same firm.

The Mary furnace, in Lowellville, Ohio, will be lighted in a short time.

The new foundry of Duncan & Baldwin, of Pittsburg, near New Castle, Pa., was started last week. One hundred and fifty men will be employed, of whom ninety will go from this city.

The Gillespie Tool Company, of Pittsburg, has sold one of its artesian well drilling-machines to Mr. Joseph Jefferson, the actor, for his plantation in Louisiana. The company will send its own men to work the machine.

The Wheeling *News Letter* says that the Pittsburg gentlemen interested in the "Free Oil Company's" well, on Gravel Bottom, came down last Monday to take a look at their big spouter, and found that the telegram sent by Brown Humphries did not do the well justice. The heavy pressure and immense flow of gas are certainly unparalleled in the State. Several efforts to test the pressure of the gas, made while the gentlemen were at the well, proved abortive. As soon as the necessary piping and appliances can be obtained and attached, boring will be continued. The drillers have a theory, founded upon former experience, that a much greater volume of gas will be obtained a few feet deeper in the rock.

Some time ago, the Lane & Woodworth Glass Roof Company, says the Youngstown (Ohio) *Register*, sold the patent right of the State of California to Western parties, and a manufactory was established on the Pacific coast. The new concern prospered until a rival glass manufacturer in some way obtained control of a portion of the capital stock, and then threw the company into legal difficulties, putting an effectual dead-lock on the running of the works in opposition to his own factory, which, being the only glass-works on the slope, again became a monopoly. In consequence of these troubles, the Lane & Woodworth Company had to settle for some expensive machinery ordered by the California company, and which the old company had become security for.

The Excelsior Iron-Works, of Chicago, have just shipped two car-loads of machinery, comprising a complete smelting plant, engines, boilers, blowers, etc., to Sheridan, Montana, for the Western Mining Company.

The Armington & Sims Engine-Works, Providence, R. I., have within the last week received orders for twelve engines, 14¼-inch diameter by 18-inch stroke, for the village plant or system of lighting with the Edison incandescent light. Also for ten engines, 8⅛-inch diameter, 10-inch stroke, for smaller capacity of plant for a village isolated light; one engine, 9⅛-inch diameter, 12-inch stroke, for Ford's Opera-House, Baltimore, Md.; one 8½ by 10-inch engine for a Long Branch hotel; and one 8½ by 10-inch engine for St. Louis, Mo.

After an uninterrupted run of six months, the Warwick furnace recently damped down, to permit the cleaning of the boilers, six in number. This necessitated a stoppage of four days. To overcome this stoppage in the future, a duplicate battery of six boilers is now making at the boiler-works of Sotter Brothers.

The Westinghouse Engine Company is successfully using its new automatic cut-off in its larger engines. It has recently furnished motors for three large plants —a 110 horse-power engine for the Pennsylvania Electric Light Company at Harrisburg, Pa.; another, 43 horse-power, for the Brush Electric Light, Savannah, Ga.; another, 43 horse-power, for the New York & Brooklyn Company; besides several smaller engines, ranging from 4 to 18 horse-power, for various local companies.

MINERAL PATENTS GRANTED BY THE UNITED STATES LAND-OFFICE.

The following mineral patents were issued between the 15th and 30th of April from the General Land-Office:

ARIZONA.

PRESCOTT DISTRICT.

Dosoris Mining Company, Dosoris and Buzzard lodes, and three mill-sites.

TUCSON DISTRICT.

Arizona May Mining Company, May lode. Black Rock & Pacific Company, Black Rock lode. Andrew Robertson *et al.*, Alps lode. San Pedro Mining Company, Survey lode.

CALIFORNIA.

HUMBOLDT DISTRICT.

New River Hydraulic Mining Company, Martinsville gold placer.

Digitized by Google

SACRAMENTO DISTRICT.

Jeremiah Bliss, Kellogg placer mine.

SAN FRANCISCO DISTRICT.

David Speyer, Primera chrome mine.

SHASTA DISTRICT.

Jacob Paulsen *et al.*, placer, Trinity County. Henry Junkans *et al.*, Railroad placer, Trinity County.

COLORADO.

CENTRAL CITY DISTRICT.

J. Robert Fisher *et al.*, Jewel lode. Rudolph Wurlitzer, Girard and Rudolph lodes and mill-sites. George N. Hall, Treasury Vault lode. L. E. Park *et al.*, Standard lode. Rebecca Haywood, Pythagoras lode. Cornelia C. Nimson *et al.*, Revenue lode. Frank Strausser, Dumbarton lode. William J Lusher, placer, Summit County.

DEL NORTE DISTRICT.

Roscoe G. Jordan *et al.*, Pelican lode. Plattsburg Mining and Milling Company, Governor Seymour lode and mill-site.

DURANGO DISTRICT.

Santa Clara Mining Company, Santa Clara lode. J. M. Acker *et al.*, Pigeon lode. J. X. Tunnel Company, Toledo lode. Joseph Merideth *et al.*, Grand Duke lode. John W. Bailey, *et al.*, Aztec lode.

LAKE CITY DISTRICT.

Wabash & Democrat Consolidated Mining Company, Wabash lode. Galena Gulch Mining Company, Narrow Gauge lode, and North Star lode and mill-site. C. Monjeau *et al.*, Kansas and Romantic lodes. Ouray Union Mining Company, Standard and Monitor lodes. Colorado Mining and Land Company, McIntire lode. Theron Stevens *et al.*, Great Western lode. Windham Silver Mining and Smelting Company, Olympia lode. Engineer Mountain Silver Mining and Smelting Company, Adelia lode.

LEADVILLE DISTRICT.

Israel May *et al.*, Summit lode. Mary J. Riggnis *et al.*, Maramac lode. Frederick W. Rose *et al.*, Selma lode. J. B. Weston *et al.*, Old Mariner lode. William P. Dewey *et al.*, Small Hope lode. George H. Thatcher, Jr., Illinois lode. Frank Morrison *et al.*, Gildersleeve lode. Robert G. Withers *et al.*, Rocketts lode. Robert Morrison *et al.*, Little Alice lode. James Lyons *et al.*, Iowa Chief lode. George N. Essmer *et al.*, Sylvan Dell lode.

PUEBLO DISTRICT.

Game Ridge Consolidated Mining Company, Green Silver and Ditto lodes. Jennie H. Sears, Silver Rouble lode. Richard Irwin, Melrose lode.

DAKOTA.

DEADWOOD DISTRICT.

John T. Gilmer, placer, Lawrence County.

MONTANA.

HELENA DISTRICT.

Robert McMinn, Ringold lode. Claton Ramsdell, Little Annie lode. Patrick H. Meagher *et al.*, Malone lode. Nathan S. Vestel *et al.*, Last Hope lode. Athol F. Wright *et al.*, placer, Beaver Head County.

NEVADA.

CARSON CITY DISTRICT.

George E. Crowell, Lodi South lode. Ferdinand S. Van Zandt, Potosi, Silver Palace, and Silver Crown lodes. Ferdinand S. Van Zandt *et al.*, Cadiz lode.

EUREKA DISTRICT.

Richmond Mining Company of Nevada, Rearguard lode and mill-site. Martin White Mining Company, Morrill and Juno lodes. D. J. J. McLaughlin, Black Cat lode. Kit Carson Consolidated Mining Company, Young Mabel lode.

UTAH.

SALT LAKE CITY DISTRICT.

Samuel Holdeman *et al.*, Crown Point and Clyde lodes. John J. Daly, Silver Clift and Daly lodes. Frederick Auerbach, Hecla lode. Utah Southern Silver Mining Company, Antwerp lode. Thomas G. Winn, coal.

WASHINGTON.

Ahio S. Watt, coal. John R. Hanson, coal.

GENERAL MINING NEWS.

ARIZONA.

TIP TOP.—The mill and mine have been shut down since the early part of March, in order to put up new hoisting-works. Work will probably be resumed in June.

COCHISE COUNTY—TOMBSTONE DISTRICT.

EMPIRE.—This company has begun suits against settlers to decide the title to surface ground.

GRAND CENTRAL.—More pumps are required at this mine.

VIZINA.—Reports are, that a large body of rich manganese ore has been struck in the lower level; but at the offices of the company in this city, no dispatches to this effect have been received, and the report is unconfirmed.

PIMA COUNTY.

TOTAL WRECK.—The mine is located eight miles from Pantano. The Globe *Silver Belt* says that the greatest depth reached is 340 feet. Between that and the surface are four levels, all of which have developments that prove the continuity of the ore-body. On one of the levels, the ore-breast showed 27 feet, and one of the walls only—the foot-wall—has been reached. The ore-body has been developed, in its length, 130 feet. The ore is chloride, and is allied with iron and copper. The percentage of each is small, although, looking at the ore in place or handling it, the iron seems to be the prevailing mineral. It is stated that the ore averages $60 to the ton. A twenty-stamp mill is working steadily.

CALIFORNIA.

The following companies have filed articles of incorporation:

California Copper Company. Capital, $10,000; shares, $10 each. Operations, Placer County, Cal. Directors: M. C. Taylor, Jacob Weissbein, Joseph Weissbein, John Johnston, and J. J. Ott. Principal office, Grass Valley. Copper Chief Mining Company. Capital, $5,000,000. Directors: W. Meeks, John Henderson, J. H. Moyhew, William N. Meeks, and G. W. Brown. Esmeralda Copper Company. Capital, $2,500,000. Directors: Angus G. McAfee, Frederick Conn, De Witt T. Bisbee, John Curry, and Hiram D. Tuttle. Fair Play Mill and Mining Company. Capital, $500,000; shares, $5 each. Directors: Ira P. Rankin, J. S. Bacon, S. O. Putnam, John B. Lewis, and Joel Merchant. Principal office, San Francisco. Gladstone Mining Company. Capital, $500. Directors: William L. Locke. Charles C. Kinsey, Henry Hugg, George Renner, and Thomas W. Chinn. Principal office, San Francisco. Meridian Mining Company. Capital, $500. Directors: E. L. Graves, John D. Langhorne, Jr., O. F. Graves, Joseph Benner, and Edward E. Steirs. Mohegen Gold and Silver Mining Company. Capital, $600,000; 30,000 shares. Directors; William Campbell, John Kewes, John E. Phillips, Edward Orchard, and A. Robbins. Principal place of business, Grass Valley. Moscow Gold Mining Company. Capital, $1,500,000; shares, $15 each. Directors: W. E. Dean, Ramon E. Wilson, and Charles T. Bridge of San Francisco; James W. Becknell of Redwood City; and A. W. Rose, Jr., of San Mateo. North Banner Consolidated Tunnel Company. Capital, $1,000,000. Directors: William Ternan, Alexander Gault, John Masbrouck, David Bryam, and Albert Matteson. Oakland Petroleum Mining and Refining Company. Capital, $500,000. Operations, Contra Costa and other counties, Cal. Directors: James Teaff, Jesse S. Wall, A. C. Massey, C. A. Fairchild, and B. S. Burson. Oriental Mill and Mining Company. Capital, $10,000,000. Directors: Charles McLaughlin, Joseph G. Eastland, John O. Earl, William E. Brown, and Louis A Garnett. Peachville Consolidated Mining Company. Operations, Arizona. Directors: A. W. Blair, James C. Plunkett, R. A. Redman, V. W. Plunkett, and James R. Capell. Silver Crown Consolidated Mining Company. Capital, $10,000,000. Operations, Pima County, Arizona. Directors: J. C. Handy, A. A. Bean, H. L. Coye, E. E. Potter, and E. Bouton. Summers Consolidated Mining Company. Capital, $10,000,000; shares, $100 each. Operations, Mono County, Cal. Directors: James W. Wright, John F. Summers, Aaron D. Hunt, Martin Jones, and I. S. Hetch. Place of business, San Francisco.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended April 21st shows: Ore crushed, 163·08 tons; average assay value of pulp, $41.70 per ton; of tailings, $7.27. North drift from east cross-cut, 1000 level, is 46 feet long. The quartz, which is of low grade, has increased in quantity. North drift, 800 level, is 385 feet long. North drift, 672 level, is in 98 feet, and has cut the narrow vein running down from the Fortuna east of the vein. On the 21st, a winze from the 780 level was started on the rich vein north of rise No. 19. This winze will be known as No 5.

STANDARD CONSOLIDATED.—For the week ended April 21st, the official report shows: Ore extracted and shipped to mills, 1275 tons. East cross-cut, 1000 level, is in 1338 feet. Uprise from south drift, 700 level, is up 34 feet, and shows the vein 3 feet wide. West cross-cut from north drift is 190 feet long, and the face is in hard rock. North drift No. 1, 500 level, is in 656 feet, showing the vein 10 feet wide. The winze from north drift is down 80 feet, where the vein is 10 feet wide. North uprise is up 90 feet. South uprise No. 1 is up 190 feet. West cross-cut No. 1 is 405 feet long. South drift No. 2, 685 level, is 469 feet long; the vein is 5 feet wide. The uprise from this drift is up 170 feet, and shows 5 feet of vein. Uprise No. 5 is up 108 feet, and north uprise is up 89 feet. North drift No. 3 is in 89 feet. There is no change in the stopes.

PLUMAS COUNTY—GREENVILLE DISTRICT.

GENESEE.—It is stated that the mill will be enlarged immediately and work at the mine pushed vigorously.

GREEN MOUNTAIN.—The tunnel has recently been in very hard ground. The rock is a gray quartzite, difficult to drill and requiring more holes to be bored to advance a given distance than any hitherto found since the tunnel was started. Notwithstanding the character of the ground, good progress has been made. The mills continue to run steadily.

SOUTHERN EUREKA.—Reports state that the present location of the mill, which is run by water-power, is such that it can not be worked to advantage. The mine shows favorable prospects.

COLORADO.

BOULDER COUNTY.

Several discoveries of rich ore-bodies, including tellurides and galena, have recently been made in the vicinity of Jamestown. A report says that there is a very good prospect for a second boom on the mining developments that are making, and many claims that have been unnoticed heretofore are coming to the front as valuable mines.

CLEAR CREEK COUNTY.

COSMOPOLITE TUNNEL.—This enterprise was begun about two years ago, to cut some lodes on Saxon Mountain. It is started almost at the foot of that mountain, about a mile this side of Alvarado. The breast is in from 1100 to 1200 feet, and makes considerable water; so much so that driving ahead has been temporarily suspended. Meanwhile, an immense lode, the Helen, seventy feet wide, which the tunnel has just crossed, is drifted on eastwardly. It is cut to a depth of 800 feet, and shows mineral of good promise.

KOHINOOR & DONALDSON.—Shipments of milling and smelting ore are made daily. At the Champion mine, the company is opening out the lower levels, in which the smelting ore is found in very massive bodies. The main shaft is to be sunk 150 feet deeper from its present depth of 600 feet.

SNOWDRIFT.—High-grade ore is shipped from four different places. In the drift easterly from the seventy-four-foot tunnel-shaft, ore has been found for the last thirty feet of the same character as that now sunk on, drifted on in two places and stoped in one, 250 feet farther east.

CUSTER COUNTY.

BASSICK.—The mine is in good condition. The mill will be moved from the mine to a creek a short distance away, on account of scarcity of water at the mine. A fine plant of hoisting machinery has been placed in the tunnel, and electric lights will be used in the mine.

BULL-DOMINGO.—Work will be resumed soon. All difficulties, it is said, have been settled.

DOLORES COUNTY.

Mr. Linwood O. Towne, of Rico, sends us the following notes:

GRAND VIEW.—The smelter has been steadily running and bullion shipped all winter. The mines of the company are in good condition and working a large force of men.

SANTA CLARA REDUCTION-WORKS.—These works, after being shut down for a part of the winter, have started again, and already a considerable amount of gold and silver bullion is on hand for shipment. Additional stamps and other machinery have been added.

PUZZLE.—Mr. C. A. Bacon, superintendent of this property, has just returned from England, where the mine is owned. Extensive machinery for proper working, including pumps and hoisting apparatus, will be at once put in, supplying a pressing need for developing what has proved one of the best paying mines in Southern Colorado.

PUZZLE EXTENSION.—Work is pushed and shipments made to the Santa Clara Company

PIGEON.—Considerable excitement is felt over a strike of high-grade ore, reported as being in large quantity. It is of the nature of the so-called "hard carbonate" of Leadville, with galenite.

GILPIN COUNTY.

The reports from the different mines around Central City continue to be favorable. The Wautoga lode, in Russell Gulch, is turning out smelting iron ore that mills $180 to the ton.

The Auderdell lode, in the same district, which has been idle for months, is now under lease. The crevice is large and easily worked. The ore mills from 3 to 9 ounces of gold to the cord.

The Fronteuac lode, also in Russell District, is doing splendidly. It is turning out smelting iron that pays $80 to the ton. The crevice is large and worked with but little trouble and expense.

The Star of the West, in Lake Gulch, is doing better than for a long period past. It is now producing steadily.

The Williams lode, in the same district, is leased, and is producing gold ore in one level.

Digitized by Google

CALIFORNIA COMPANY OF GILPIN COUNTY.—The report presented to the stockholders shows that active operations were begun in September last. During the year, the mine produced 10,241 tons of smelting and milling ore, realizing $126,-119. The mine is worked exclusively by contract, and the ore is raised by stoping by square fathom in the richer portions and by tribute work in the less productive parts. The two systems have returned ore at the following rates:

STOPES.

	Per ton.
Excavation	$1.83
Mine charges	1.23
Tramming	0.55
Cobbing, etc	0.25
Salaries and expenses	0.30
Taxes, etc	0.075
Total	$4.235

TRIBUTE WORKS.

	Per ton.
Excavation (including tramming, cobbing, etc)	$7.49
Mine charges	1.23
Salaries and expenses	0.30
Taxes, etc	0.075
	$9.095

The cost of hauling to the mill at Black Hawk is $1.20 per ton, and milling, inclusive of its proportion of salaries and taxes, $1.805 per ton. The main shaft has been enlarged and retimbered throughout and arranged for hoisting through two compartments. The erection of machinery was completed some time in July, 1882. It was not till the 23d of August following that the mine was cleared of water, and still later when the lower levels got into working condition again. A steady development of the mine has been carried out since. Sixteen hundred and eleven feet of drifts have been added, costing on an average $3.30 per foot in labor and explosives; 594¼ feet of winzes and rises at an average cost per foot of $3.39; and a new lift of ground has been won by sinking the shaft below the 1300-foot level. About one hundred men are now employed at the mine and mill.

HINSDALE COUNTY.

BELLE OF THE WEST.—Work is progressing with encouraging results. The fourth level is now in 150 feet. The lode is improving, showing good gray copper.

ULE.—A new 100 horse-power engine has been ordered for the concentrator. It is the intention to extend the work as soon as the water supply increases. Higher grade ores for treatment will probably be bought during the season.

LAKE COUNTY.

The Leadville *Herald* reports upon a number of mines situated in the vicinity of South Evans Gulch and Little Ellen Hill as follows:

At the Bessie, a shaft is sinking on the lode, which is part of the Boulder property. The shaft is down fifty feet, and a vein of good-looking quartz two feet in thickness has been cut.

The lower shaft of the Cleveland mine is operated by lessees, and is down about ninety feet. A short drift was run at this depth, and a winze sunk to a depth of twenty feet. A drift has been started from this winze, and is now in about eight feet. A large body of contact-matter has been struck, and has not as yet been penetrated. A feeder about three inches wide of hard carbonate is shown in the contact, and the drift is running on this feeder.

The Little Ellen mine, the property of the American Mining and Smelting Company, is situated on Little Ellen Hill. The amount of development-work done proves the property to contain a large body of ore running high in lead and carrying some silver. Water has been struck, but the effect will be rather beneficial than otherwise, as there is less danger to the men from leading. Considerable ore is shipped to the company's works in Leadville.

On the east side of Breece Hill, a shaft has been sunk on the Mary A. mine to a depth of about fifty feet. A number of feeders were cut, and as they were evidently tending toward a body of ore, a drift was run, and there is now a four-foot breast of ore exposed in the drift.

The properties formerly known as the Miner Boy and Colorado Prince have, by recent decisions in the courts, been merged into one, and are now known as the St. Louis. The mine is worked under a lease. The work is done all the way from level No. 4 up to the eighty-foot level, and a large amount of ore is now in the bins awaiting shipment. Nothing is doing with the lower workings, which are full of water. The ore is a quartz which carries gold and silver. The average value of the ore is about $75 per ton. The shipments will be increased shortly. One of the best properties on Little Ellen Hill is the Tenderfoot. The mine is developed by a shaft about 100 feet deep, from which No. 1 level is run about 135 feet in a southeasterly direction. The contact is an iron liberally sprinkled with galena, and pitches southeast at an angle of about forty-five degrees. It was first encountered about fifteen feet from bottom of the shaft in the first level, and when first cut was about five feet in thickness. A second level has been run to the left, and about six feet below the No. 1 level. At fifty feet from the shaft, this No. 2 level has opened up a body of hard carbonates, which shows about four feet in thickness where first encountered. A winze has here been sunk in the No. 2 level to a depth of thirteen feet, making about a twenty-foot face, which is entirely mineral. A drift has been run from the bottom of this winze a distance of fifty feet, and in this drift the latest and most important strike in the mine has been made. It is a lead carbonate, and is much softer than the mineral above it. Chloride stain is seen all through this ore, and it is evidently of an excellent grade. The main shaft will be sunk fifty feet deeper, and a level run to tap the ore-body from below, thus facilitating the shipment of ore. No stoping has been done as yet, though considerable ore has been shipped.

BREECE.—About fifty tons of ore are shipped daily, which carries sixty per cent of iron. The shipments will be increased shortly. A twenty-five foot breast of this iron is exposed in the workings.

HUMBOLDT.—This company owns about sixty-five acres on Carbonate Hill. There are ten claims in all, most of which are patented and a number of which are at work. Among the most promising are the Gold Leaf, Modest Girl, and Thistle. The former of these is worked under a lease. A drift has been run in a southeasterly direction from the shaft, at a depth of 185 feet from the surface, and a body of sand carbonate three feet wide has been struck, the ore of which averages thirty-five ounces in silver. The vein is widening. The company is working the Modest Girl. A fine contact has been struck in the drift at a depth of 100 feet from the surface, and the company expects to strike the ore-body in a few days. The Thistle has not yet started up. This claim will also be worked by the company.

ROBERT E. LEE.—About forty men are employed, and only prospecting is done. No mineral is shipped.

SUMMIT COUNTY.

ROBINSON.—Eight hundred tons of ore were shipped last month. The grade of the ore seems to be improving. Mr. Greer, the lessee, has been experimenting with the wet method of concentrating, at Kokomo. A dry concentrator, consisting of a crusher and rolls, will be put up at Robinson, and will be in working order shortly.

DAKOTA.

A dispatch from Deadwood says that the only works in operation there now are the six mills of the Homestake companies, the Caledonia, Gustin, Esmeralda, and Florence, none of which present any thing of special importance to report.

CALEDONIA.—The lower winze is down 110 feet, and will be sunk thirty feet farther, to secure a vertical depth of 100 feet, when a drift will be run to a point beneath the present main shaft, eighty feet distant, and the two workings connected by working up rather than by sinking the shaft. The mine shows a fine body of ore.

ESMERALDA.—A dispatch to the *Tribune* says that the last clean-up was attached at Deadwood by the owners of the False Bottom ditch, from which water for the mill is obtained. It has not been made public why satisfaction of the claim (which amounts to $1000) was refused.

FATHER DE SMET.—The superintendent's report from April 15th to April 22d shows: Ore extracted from first, second, and third levels, 1925 tons. Ore milled, 1925 tons. North end tunnel advanced 5 feet; tunnel in 874 feet; Golden Gate north header advanced 7 feet; header in 83 feet.

PENOBSCOT.—The old mill is running ten stamps with sufficient profit to enable the owners to maintain thorough prospecting-work. The mine has been well developed and shows a fine body of ore. It is highly probable that a sixty-stamp mill will be erected this summer.

SITTING BULL.—The recent ten-days' run of the smelter yielded $63,287 base bullion. The smelter will remain idle the rest of the season, as with the addition and improvements to the mill, all ore can be successfully treated by the latter, and at a considerable saving over the old process. The new works are expected to be in operation before the close of May.

WELCOME.—The company has a twenty-stamp mill on the road for erection on its property near Terry's Peak.

GEORGIA.

BUFFINGTON.—The work of development by the new company has begun.

COLUMBIA.—The flume is pushed rapidly, completing about 200 feet a day. A vast amount of work outside the flume is doing. The expense of building the flume will not be so great as was expected. The old flume will be repaired.

CONSOLIDATED GOLD MINING COMPANY OF GEORGIA.—A giant is cleaning up the way for the new flume-line, which, when completed to the Martin cut, will be nearly one half-mile long.

IDAHO.

A number of the owners of claims on East Forks are arriving and starting work on their properties, and a number of others are looked for daily. The superintendent, with twelve miners, has arrived and resumed work upon the Paymaster group, which is owned by the Philadelphia Company. New buildings will be erected, and work pushed ahead.

ILLINOIS.

The following companies have filed articles of incorporation:

Lacy Coal Mining Company. Capital, $100,000. Incorporators: William R. Ogden, Charles H. Mason, and W. Q. Smith. Western Indiana Coal Company. Capital, $20,000. Incorporators: James J. Kelly, George M. Rogers, and Samuel P. McConnell.

MAINE.

STEWART.—During the present week, the 160-foot level was started from shaft No. 3, and will be run eastward. After the drift has reached the length of 20 feet or thereabouts, so that injury from blasting may be avoided, the Cornish bucket-pump will be put in place, and the plant, so far as hoisting and pumping are concerned, will be complete. A cross-cut to the north, to explore the foot-ground and reach the new "find," will be started from a convenient point in the drift, and underground work will be vigorously prosecuted. An open cut, some 50 feet in length, has laid bare good ore in the northern portion of the vein; and a slope down the hillside furnishes a natural stope, which is now worked.

MEXICO.

BOSTON & MEXICAN OIL COMPANY.—This company is working at Chapopote. The first well is down 600 feet, with every indication of a heavy body of oil. It is not definitely decided where the refining-works will be erected, but probably near Tuxpam. A recent analysis made of the bitumen which flows naturally on the surface in large quantities near the well gives over 30 per cent of paraffine oil, 10 per cent of illuminating oil, and 44 per cent of valuable black bitumen.

ENCINO.—This mine, situated at Pachuca, has been closed for three months, on account, as it is stated, of the inability of the company to get its ores worked at satisfactory prices. Upon the completion of the Progreso reduction-works, mining will be resumed.

NEW YORK MEXICAN.—The company has its machinery in operation and is now engaged in taking out and reducing its ore.

MICHIGAN.

The following company has filed articles of incorporation:

Iron Hill Mining Company. Operations, Michigan. Officers: President, Richard Oliver; Vice-President, John Stiles; Secretary, J. D. Sampson; Treasurer, James H. Gee.

CENTENNIAL.—The latest advices are, that there is great improvement in the amygdaloid in the north part of the mine. Openings on the lode are affording as good ground as its southern prolongation in the Osceola mine.

KEARSARGE.—The southern test pits on the amygdaloid have recently developed the best show of copper yet made on the property.

INDIANA.—The Marquette *Mining Journal* says that the shaft is going down 128 feet east of the present workings in clean blue ore of the very finest quality, while the developments underground prove beyond doubt the existence of a large body of ore. A drift north through the supposed foot-wall—which proved to be a mere shell of rock—shows nearly if not quite 20 feet of ore beyond; while another large drift south cut a few feet of mixed ore and some rock, beyond which it shows 22½ feet of ore in the back, and over 30 feet in the bottom, without the slightest mixture. A large amount of work has been accomplished, but considerable work remains to be done to get the mine into good shape for economical production; this is pushed forward as rapidly as possible.

MONTANA.

The following company has filed articles of incorporation. Société Anonyme des Mines de Lexington. Capital, 20,000,000 francs. Operations, Silver Bow County, Mont. Incorporators: Charles Wallnut, George Alfred de la Bouglaise, Laurent Goybert, William Booth Finlay, Charles Arthur, Viscount de Rafelis Brouves, Abraham Cremuitz, and Edmond Pierre Auguste Lemoine.

The Helena *Independent* says that the mines of Emigrant Gulch, discovered in 1864 and worked every season since, are expected to prove more remunerative than ever before. The pay-dirt is from twenty to one hundred feet thick. During the winter, drifts have been worked and as high as $1000 to the box secured during a clean-up. The water available is at no time less than 700 inches, and at the best season there are 3000 inches.

LEWIS & CLARKE COUNTY—MARYSVILLE DISTRICT.

DRUM LUMMON.—Work on the mine is now beginning in earnest. A tunnel has been started on the bed of Ottawa Gulch, to tap the vein at a distance of over 400 feet below the present workings, or about 600 feet beneath the surface. This tunnel will be between 1100 and 1200 feet in length; and as it will be the main working tunnel, it is to be large enough for all future necessities. It will be wide enough for a double track, and will penetrate the mountain from the north. It is the purpose of the company to push the work as rapidly as possible, and

Digitized by Google

that end all modern appliances and machinery for tunneling will be brought into use. It will, however, require several weeks to complete the open cut necessary to be made in getting a face in which to start the tunnel. By that time, it is hoped to have all the necessary machinery on the ground for driving the tunnel as fast as possible. About 140 days will be required to complete it. No decision has been reached in reference to the character of the mill to be erected. The company intends to determine first what process will be the most economical in treating the ores, and to that end careful tests and assays of the ore are making.

MADISON COUNTY.

A correspondent of the Butte *Miner*, writing from Salisbury, says that the reports from Tidal Wave and surrounding districts are favorable, and are attracting attention all over the territory. One of the best mines in this district is the Magnolia. A tunnel has been run in 75 feet, which shows a body of galena over thirty inches wide. Assays made gave 60 ounces silver, $17 gold, and 68 per cent lead.

The Bald Mountain and Mineral Hill leads will be worked this summer. In these leads, the ledge is from five to seven feet wide, and runs from $60 to $70 in silver, 40 per cent lead, and $9 in gold.

The Holdfast and Wolverine, at the head of Georgia Gulch, are looking well. There are about thirty tons of ore each on the dump and fifteen inches of fine lead in the bottom of the shaft.

The lower end of the district is picking up. The Blue Sky lead shows up well. During the winter, a shaft now 95 feet has been sunk, which shows a ledge that is over ten feet wide. The ledge contains magnetic iron and carbonate rock.

NEVADA.

EUREKA COUNTY.

When the mill was closed last January, at Mineral Springs, says a correspondent of the Eureka *Sentinel*, it was understood that operations would be resumed in April; but the stormy weather has prevented, and no ore has been hauled to the mill as yet, and probably will not be for several weeks.

The outside mines are showing up considerable ore of various grades. A Chicago company has several men employed on a prospect just south of the Austin mine, and is taking out some good ore.

The old Bonanza is also showing some rich ore, but the seam is small.

The Livingston mine is also producing high-grade ore. Where the owners worked two years since, on the extreme western portion of the claim, the ore was base; while on the east end, it is mostly free milling. Possibly a shipment of this ore will be made to the mill soon after it starts crushing.

The Poor Boy is situated on the western slope of the hill, and is on the main belt of smelting ore, which runs along the foot of the mountain for a considerable distance. Owing to the amount of work done this spring, it shows perhaps better than any other property in this group. The ore was easily extracted and there are probably 100 tons on the dump. This carries too much lead to mill. The owners expect a furnace to be erected in this vicinity this summer.

RUBY-DUNDERBERG.—On the south side of Home Ticket Hill, this company is sinking a new shaft, upon which will be placed a small steam-hoist formerly used at the Continental mine. This shaft is sinking for the development of an ore-body that is assuming considerable proportions, the ore of which is becoming richer as the deposit is followed in a westerly direction.

NEW MEXICO.

The following companies have filed articles of incorporation:

Golden Rule Mining Company. Capital, $1,000,000; shares, $10 each. Directors: C. P. Crawford, N. Bell, T. Stevens, H. Booth, and J. D. Pancake. Hagan's Peak Tunnel and Mining Company. Capital, $1,000,000; shares, $100 each. Operations, Socorro County, New Mexico. Incorporators: Mariano Armijo, John H. Sullivan, Jacob M. Briggs, and A. C. Swift. Principal place of business, Albuquerque. Iron King Mining Company. Capital, $500,000; shares, $10 each. Operations, Grant County, New Mexico. Incorporators: Alexander B. Hill, Philip W. Holmes, and Robert H. Worthington. Niagara Mining and Refining Company. Capital, $2,500,000; shares, $50 each. Operations, Grant County, New Mexico. Incorporators: William W. Trevor, John A. Merritt, William W. Bowen, and Burt Van Horn.

NEW YORK.

The following companies have filed articles of incorporation:

Blue Ridge Copper King Mining Company. Capital, $500,000. Lenox Smelting Company. Capital, $10,000. Sterling Lead and Zinc Company. Capital, $500,000.

PENNSYLVANIA.

The following company has filed articles of incorporation:

Jorilla Copper Mining Company. Operations, Jorilla Mountains, New Mexico.

A vein of iron, five feet in thickness, and mining back into the hill at Bellevue Station, was recently uncovered by workmen on the Fort Wayne Railroad. Examination shows that the ore is of the same description as that found at Wampum and up the Alleghany River about Kittanning. Over it is a layer of a poor sort of fire-clay, and underneath it is a bed of soapstone. The vein looks rich, and, it is believed, will turn out a 40 per cent ore. The ore could be mined easily, as it is in a side-hill, and could be delivered at the furnaces for $2 a ton, while most of the ore of that grade costs from $4 to $8.50. There is not a vein worked within fifty miles of the city.

SOUTH CAROLINA.

PHŒNIX.—The product of this mine in sulphurets, with but little free gold, worked by the Mears chlorination process, yielded a gold bar which assayed at the U. S. Mint at Philadelphia 977 fine. The weight before smelting was 181·64 ounces, and after smelting 181·53 ounces. It was valued at $3673.75.

UTAH.

The following companies have filed articles of incorporation:

Albion Mining Company. Capital, $500,000; shares, $5 each. Operations, Big Cottonwood, Utah. Officers: Thomas C. Armstrong, President; Jacob S. Boreman, Vice President; and George Thackrah, Secretary. Principal place of business, Salt Lake City. Columbia Mining Company. Capital, $500,000; shares, $5 each. Operations, Big Cottonwood, Utah. Directors: George Thackrah, Thomas C. Armstrong, Adolph Hauerbach, all of Salt Lake, and Henry Thackrah, of Leeds, England.

The Lead mine, at Bingham, has begun shipping two cars of first-class ore per day; it is working thirty men, and the machinery has been put in better condition. A concentrator, with a capacity of 100 tons crude ore every twenty-four hours, with a force of 32 men, will be put in operation in about a week.

Reports from Park City state that the Empire mine has been shut down. The Ontario keeps up a steady output of bullion. The company is constantly making improvements, which are of a substantial nature, calculated to last for years. The ore-bodies increase in richness as depth is gained, and there is every probability that the mine will be worked to a depth of 3000 or 4000 feet. The ore in sight is ample to run two mills the size of the present one for years to come, and there is talk of a second one to be built, but arrangements are not yet completed.

On Rebellion Hill, the ore-bodies have increased in richness and size. The Crescent shows very favorable prospects. This company has recently taken in the Walker & Buckeye, and has a large tract of ground to explore.

The Apex Company has struck in the past two weeks a vein carrying ore similar to that of the Crescent, which is pronounced by miners to be the vein. Shipments from the Apex will be begun in a short time.

The Samson has also developed into a mine, and shipments have already been made, but they were cut short by bad weather and roads.

WYOMING.

A letter written from Lewiston to the Salt Lake *Tribune* says that the principal mine in the camp, and, in fact, the only developed one at present, is the Bullion, about which much has been said, while outside of the immediate neighborhood comparatively little is known. With no development in reality worthy of mention, the Bullion shows a large body of ore. The only work done on the mine has been the uncovering of the ledge to the extent of eighty feet in width and 150 feet in length, and one shaft sunk to the depth of thirty-two feet with ore that distance; several small cuts and a few shafts ranging from six to fifteen feet have been run and sunk on the ledge, in order to ascertain the depth of the ore-body. The ten-stamp mill situated on the ledge started up in April. The ore run through was a lot of 60 tons, second-class ore, and the result was 43 ounces of gold, a yield (at the rate of $17.50 to the ounce) of about $12 to the ton.

An abundance of water is at hand, and large quantities of wood and coal easy of access can be had for fuel. Men looking for work by day's wages will find this the poorest camp for them on the coast; in fact, the only men here working for wages are late importations from the Black Hills.

The first extension east, known as the Arkansas, and owned by R. M. Ricketts, is prospected with favorable results. The second extension east, known as the Anaconda, has, snake-like, wound its way, till, distant from the Bullion 3000 feet, the owners have struck, at the depth of 40 feet, a five-foot vein of quartz.

Still farther east, is another claim, known as the Overland, which has been developed sufficiently to show it to be the same as the Bullion. The owners of the two last named contemplate the erection of a twenty-stamp mill very shortly. It is stated that negotiations for the same with Denver parties are now pending.

Still farther east, are several other claims, only one of which the writer has been enabled to get the name of, namely, the Comet, which is to be developed this spring.

Returning to the Bullion, we find the first extension west, known as the Bullion Extension. The owners are working it, and rumor has it that they have struck the Bullion ledge.

On the second extension west, known as the Midas, and the third west, known as the Dahlonega, no developments have been made.

One thing remarkable in regard to this section is the presence of placer gold, for miles in any direction, where there is any depression in the ground. For instance, a swale, or slight depression in the land, will be found the receptacle of placers in paying quantities. Many gulches have been worked out, and dirt carted for miles and sluiced with good results. Some have barely paid, while others have yielded an ounce to the man per day. Many will not pay. The Miner's Delight mine, the Camissa, in South Pass District, the Mary Ellen, in Atlantic District, and the Bullion and Anaconda, all known to be good properties, were discovered upon working placers until the ledge was found at the head of the gulches.

PATENTS GRANTED BY THE UNITED STATES PATENT-OFFICE.

GRANTED APRIL 3D, 1883.

274,907. Kiln for Drying Bricks, etc. Cyrus Chambers, Jr., Philadelphia, Pa.
274,910. Kiln for Drying Brick, etc. Harvey Cockell, Chicago, Ill., Assignor to Cyrus Chambers, Jr., Philadelphia, Pa.
274,911. Metal-Working Plant. Arthur Cooper, Middlesborough, County of York, England.
274,956. Ore-Crusher and Pulverizer. Robert McCully, Philadelphia, Pa., Assignor of one fourth to the Gunsight Consolidated Silver Mining Company, of Arizona.
274,990. Self-Feeding and Smoke-Consuming Furnace. Lichfield Watton Sutcliffe, Birmingham, County of Warwick, Assignor of one half to William Edmund Parkes, Soho Hill, Handsworth, County of Stafford, England.
275,031. Pulverizing-Machine. Herman B. Feldmann, Philadelphia, Pa., Assignor of one half to Stephen P. M. Tasker, same place.
275,057. Miner's Candlestick. John C. Martin, Tuscarora, Nev., Assignor of one half to George T. Redsull and William W. Rogers, both of same place.
275,119. Puddling-Furnace. John Bergqvist, McKeesport, Pa., Assignor of one half to Charles Funke, same place.
275,224. Steam Stamp for Crushing Ore. Erasmus D. Leavitt, Jr., Cambridgeport, Mass.
275,232. Cupel-Furnace. John Lynch, Alleghany City, Pa.
275,272. Roasting and Reducing Furnace for Gold and Silver Ores. Jacob E. Rice, Twin Lakes, Colo.
275,325. Apparatus for Sizing and Amalgamating Precious Metals. Charles D. Bigelow, Brooklyn, N. Y.

GRANTED APRIL 10TH.

275,357. Dumping-Car. Nathan W. Condict, Jersey City, N. J.
275,371. Apparatus for Regulating the Flow and Delivery of Water through Canals, Flumes, and Water-Ways. James Emerson, Willimansett, Assignor of one half to the Holyoke Water-Power Company, Holyoke, Mass.
275,451. Smoke-Consuming Furnace. Christof Zacharias, Vienna, Austria-Hungary.
275,532. Dumping-Car. John Smith and John P. Rhodes, Rockville Center, N. Y.
275,566. Pulverizer. Henry Bailey, New York City.
275,574. Device for Feeding Air to Furnaces. William J. Bradshaw and William W. Cowley, Cleveland, O.
275,719. Crushing and Pulverizing Machine. Gideon Sibley, Philadelphia, Pa.
275,729. Apparatus for Treating Ores. Elijah W. Stoufer, Salida, Colo.

GRANTED APRIL 17TH.

275,805. Boiler Furnace. Hiram Cowell, Zanesville, O.
275,809. Ore-Concentrator. Patricio W. Duffield, New York City.
275,885. Hand Drilling-Machine. Jacob Cherney, Denver, Colo.
275,992. Apparatus for Casting Hollow Chilled Rolls. John M. Case, Columbus, O., Assignor to the Case Manufacturing Company, same place.
276,002. Coke-Oven. Brodie Cochrane, Durham, County of Durham, England.
276,018. Manufacture of Steel Castings. George W. Francis, Middletown, Conn.
276,074. Extracting Nickel from Ores. Jean P. Prat and Jules P. Laroche, Bordeaux, France.
276,086. Rolling-Mill. Thomas Shaffer, Phœnixville, Pa., Assignor to the Phœnix Iron Company, same place.
276,116. Apparatus for Pumping and Flowing Oil-Wells. Eli S. Williamson, Bradford, Pa.
276,143. Preparation and Production of Mineral Phosphates. John James Knight, Widnes, County of Lancaster, Assignor of one half to Thomas Leech, Hough Green, Ditton, England.
276,145. Pulverizing-Machine. T. Mallon Rogers, Philadelphia, Pa., Assignor of one half to Stephen P. M. Tasker, same place.

GRANTED APRIL 24TH.

276,147. Machine for Pulverizing Clay for Making Brick. William Andrus, Keokuk, Iowa.
276,181. Dry Ore Concentrator. Joseph Hubert, San Francisco, Cal.
276,222. Charcoal-Furnace. John Burt, Detroit, Mich.
276,228. Brick-Machine. Israel Cullen, Pittsburg, Pa.
276,384. Metallurgical Plant. Robert Forsyth, Chicago, Ill.
276,394. Pulverizing Apparatus. Amos E. Griffiths, Philadelphia, Pa.
276,418. Shoe and Die for Amalgamating Pans. Joseph S. Johnson and Melzar Osborn, Dos Cabezas, Ariz.
276,453. Manufacture of Steel. Harry M. Nichols, New York City.
276,504. Coke-Furnace and Apparatus connected therewith. Richard Thomas, Carbondale, Ill.
276,534. Ore-Separator. Benjamin Hershey and Charles A. Hitchcock, Erie, Pa., Assignors of one half to Joseph A. Ege and Benjamin F. Thornton, both of Bradford, Pa.; said Hershey Assignor of one twentieth to said Hitchcock.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, May 4.

There is no change from our last to note in the mining market. Business has been remarkably dull, and the dealings have been confined to a few low-priced fancies. Sonora Consolidated, the chief stock dealt in, has developed considerable weakness and closed weak to-day. Sierra Grande has also become quite weak under heavy transactions. Robinson Consolidated was active and steady. The remainder of the market was dull and of no interest. We give a complete summary below. The total sales of mining shares at all the Exchanges aggregates 240,374, as against 326,892 last week.

The Comstock shares have been quiet and strong. California was dealt in to the extent of 6200 shares at 22@25c. Consolidated Virginia records a small business at steady prices; it sold from 47@50c. Sierra Nevada, with a small business, was strong, selling from $3.30@$3.70. Union Consolidated was fairly dealt in at steady prices; it sold from $4@$4.50@$4.25. Mexican was quiet and steady, and sold from $2.75@$2.80. Yellow Jacket was very quiet, and sold at $4.50. Sutro Tunnel records a large business at steady prices; it sold at 21@20c.

The Leadville stocks were moderately dealt in, and were steady. Amie was quite active and steady, selling to the extent of 11,900 shares at 21@20c. Chrysolite records a fair business at steady prices, selling from $1@1.05. Hibernia sold at 4c. Iron Silver was quiet and steady, and sold at $2.90. Leadville Consolidated records a small business at steady prices; it sold from 68@70c. Little Chief was fairly dealt in, and was strong; it sold from 48@55c. Little Pittsburg was very irregular, under a moderate business, selling from 50@65@55c. Climax was quiet and steady at 8@10c.

The Bodie stocks were quiet and firm. Bodie Consolidated sold at $1.25@$1.20, with a small business. Standard was quiet and steady, selling from $6.50@$6.75. Bulwer records a small business, and was weak; it sold from 84@70c.

The Tuscarora stocks had a very small business, but were strong. Grand Prize continues strong, under a small business, selling from $1.15@97c.@$1.10. Argenta records a small business and was strong, selling from $1.16@$1.30. Navajo was quiet at strong prices, selling from $2 35@$2.65. North Belle Isle sold at 30c., with a business of 200 shares. Independence showed considerable strength, under a fair business, and sold from 53@67c. Elko Consolidated was very quiet, the assessment-paid shares selling at 19c., and the assessment-unpaid shares at 6@4s.

In the miscellaneous list, Alice was quiet and strong, selling at $3@$3.35. The Green Mountain stocks were almost neglected, Green Mountain alone being dealt in; it was quiet and irregular at 84@76@79c. Hall-Anderson was very actively dealt in at strong prices; it sold from $1.35@$1.60@$1.50. Horn-Silver had a fair business and was irregular, selling from $7.88@$7.25@$7.63. Northern Belle was steady under a small business, selling from $8.50@$8.75. Robinson Consolidated was actively dealt in at steady prices; it sold from 79@85c., closing to-day at the latter figure. Sierra Grande has been quite weak; under a large business, it sold from $1.75@$1.25, closing at $1.30, the transactions aggregating 12,100 shares.

Alta-Montana was active and steady at 4@3c. Bradshaw developed considerable strength, under a small business, and sold from 27@42c. Caledonia (B. H.) was irregular at 75c.@$1@70c. Central Arizona sold at 30c. Decatur was quiet and irregular, selling from 2@4c. Durango had a small business, and was weak; it sold from 8@5c. Harlem records a small business at steady prices, selling from $1.45@$1.50. Lacrosse was active and steady at 10@11c. Oriental & Miller was fairly dealt in at steady prices; it sold from 13@16@15c. Rappahannock was quiet and steady at 8@7c. Silver Cliff sold from 20@18c., the business being small. Sonora Consolidated had a very active business and was very weak; it declined from 86@45c., closing at the latter figure. South Pacific sold at 6@5c., with a business of 3600 shares. The State Line stocks were almost forgotten. Nos. 1 & 4 were dealt in to the extent of 100 shares at 2c., and Nos. 2 & 3 to the extent of 500 shares at 3c.

The American Mining Stock Exchange, after an existence of nearly three years, has closed up its affairs and exists no longer. The lease of its rooms ended May 1st. About forty of its members have joined the New York Mining Stock and National Petroleum Exchange. Mr. J. R. Mullany, Chairman of the Governing Committee, announces that the office of the Governing Committee will be, until further notice, at No. 63 Broadway, Room 14.

The trustees of the Caborca Mining Company have levied an assessment of ten cents per share on its capital stock, delinquent in San Francisco May 21st.

Thomas B. Pheby has been arrested in this city by a deputy-sheriff, on an order of arrest issued by Judge Sedgwick, and confined in Ludlow Street Jail in default of $20,000 bail. The order of arrest was granted on affidavits of the Inyo Consolidated Mining and Milling Company of California, charging Mr. Pheby with having appropriated $50,468.46 belonging to the company. The affidavits recite that Mr. Pheby was made superintendent of the company on September 6th, 1881, and that on October 4th his salary was fixed at $500 a month. He was to take charge of the mill and the work of reducing the silver ore to bullion which he was to sell for the company. On January 30th, 1882, he made a report that he had $10,872.92 on hand, above all the claims against the company. It is charged that he afterward abstracted twenty-five bars of bullion valued at $25,865.54. The mill and machinery were damaged by fire in December last, and Pheby is said to have received $33,500 of insurance money in settlement of the damage. He afterward came to New York, it is charged, with $70,238.46, and put in vouchers for expenditures amounting to $69,901.93. An examination has since shown, according to the affidavit, that the actual expenditure was only $19,770, and Pheby is said to have acknowledged the fact and to have promised to make restitution. Failing to do this, the suit was brought upon which the order of arrest was granted.

MEETINGS.

Auraria Gold Mining Company, No. 709 Eighth avenue, New York City. Annual meeting of stockholders and election of trustees, May 24th, at one o'clock P.M.

Leadville Consolidated Mining Company, No. 92 Broadway, New York City. Annual meeting of stockholders and election of Trustees, May 21st, at two o'clock P.M.

DIVIDENDS.

The Castle Creek Mining Company, of Idaho, has declared a dividend (No. 12) of three per cent on the capital stock, payable May 16th.

The Holyoke Mining Company, of Idaho, has declared dividend No. 8 of two per cent, payable May 12th.

The Horn-Silver Mining Company, of Utah, has declared a quarterly dividend (No. 9) of $300,000, payable May 15th. Transfer-books close May 7th, and reopen May 16th.

The Leadville Consolidated Mining Company, of Colorado, has declared a dividend (No. 7) of five cents per share, payable May 10th. Transfer-books close May 5th.

The Sierra Buttes Mining Company, of California, has declared its semi-annual dividend of twenty-five cents per share.

The Standard Consolidated Mining Company, of California, has declared its usual monthly dividend of twenty-five cents per share, payable on May 12th, at the Farmers' Loan and Trust Company.

PIPE LINE CERTIFICATES.

The following table gives the quotations and sales at the New York Mining Stock and National Petroleum Exchange:

		Opening.	Highest.	Lowest.	Closing.	Sales.
April	28....	$0.89	$0.89	$0.85⅝	$0.85⅝	2,490,000
	30....	.87	.90½	.86⅞	.89⅛	3,009,000
May	1.....	.90	.92¾	.89⅝	.92⅝	2,519,700
	2.....	.93⅛	.95⅛	.92¼	.92⅝	3,287,000

	4.....	.93⅜	.94	.92	.92⅛	1.628,000
Total sales.....						17,985,700

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been quite active this week, and prices have been strong. The Comstock shares show an improvement under large dealings. There is nothing of importance from the mines. The outside stocks have also been strong, with a good business.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, May 3.

The market for copper stocks the past week has ruled dull and lower, with the exception of Calumet & Hecla, which, owing to the firmness of ingot, has advanced several points, and possibly the expectation of an extra dividend during the coming year may have tended to help the advance. Quincy has been the weak point, and shows a decline of about $4, with a tendency to still lower figures. Osceola declined on small sales from $23½@$22. Atlantic sold at $11, a decline of $1 per share since last sale (April 3d). Franklin, dull, with no disposition to trade in the stock; a small lot sold at $10. Pewabic was dull but steady at $4. Calumet & Hecla opened at $230¼, a decline of $½ from last week's closing sale, further declined to $230, when a steady advance set in to $234, which was bid to-day with no stock offering. Quincy steadily declined from $44@$40¼, at which price it sold to-day, and closed at $40 bid. Among the low-priced stocks, we note sales of Huron at $1¼; National, at $1¼; both assessment ($1) paid. Allouez, $2. Ridge, 62½c. The rest of the list was neglected.

In silver stocks, Bonanza Development advanced from $1¾@$2½ on reports that the company had received an offer for a portion of its property, the sale of which would enhance the value of the stock. About 5000 shares changed hands. Catalpa, dull but steady at 62½@65c. Silver Islet has had another of its periodical awakenings, the stock suddenly jumping from $2½@$5½, assessment ($1) paid. Just why, is a mystery, as we can not learn that there is any improvement in the outlook of the mine to warrant the advance. Sullivan maintains the advance of last week at $1¼. San Pedro declined from 60@50c., with plenty of stock offering at the latter price.

About the usual amount of business has been transacted at the Mining Exchange, but the market lacks vigor, and there is no inducement to operate in the specialties listed at the Board. Empire declined to 19c. Bowman Silver sold at 16@17c. Massachusetts & New Mexico was dull at 9@10c.

3 P.M.—The market was dull this afternoon, with prices fairly steady. Bonanza sold at $2 7/16. Osceola declined to $21½. Quincy sold at $40¼. Silver Islet, $4¾. Closing prices: Allouez, $1½ bid. Atlantic, $10 bid. Bonanza, $2 7/16 asked. Calumet & Hecla, $234 bid, $235 asked. Catalpa, 67½@70c. Crescent, 25c. asked. Huron, $1½ bid. National, $1¼ bid. Quincy, $40¼ bid, $40½ asked. Sullivan, $1⅛ bid, $1¼ asked. San Pedro, 47½@50c.

BULLION MARKET.

NEW YORK, Friday Evening, May 4.

The silver market abroad and here continues in

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended May 4th, as compiled from various sources, amounted to $130,000, as against $286,000 reported for the previous week. The receipts from January 1st, 1883, to date are $4,679,713.53.

METALS.

NEW YORK, Friday Evening, May 4.

Copper.—There have been sales of copper other than Lake as low as 14⅛c. and upward to 14½c., the cheap lots being temporarily cleared out of the market. We quote 14⅜@15¼c. as the range of the different brands, and 15⅛@16c. for Lake, of which there is little in the market, 15¾c. having been bid in vain for large lots.

We may note here that contracts have been closed in England for the purchase of several thousand tons of high-grade ore from the Anaconda mine, of Butte City, Montana.

G. Gold. S. Silver. L. Lead. C. Copper. * Non-assessable. † Stocks quoted on S. F., San Francisco; B., Boston; P., Philadelphia. Non-Dividend shares sold, 139,929. Total shares sold, 240,374.

England cables £62 for Chili Bars, and £69 for Best Selected.

Messrs. Vivian, Younger & Bond, of London, under date of April 19th, quote ores and regulus, Liverpool or Swansea, 12s. 3d.@12s. 9d.

Messrs. J. Berger Spence & Co., of Manchester, report the price of cupreous pyrites 6d. per unit, and non-cupreous 7d. per unit of sulphur.

Tin.—Business in spot lots has been restricted, while there has been considerable speculative purchasing. The metal appears to be in a sound condition. We quote Straits, spot, 21¼c. cash, round lots; Australian, 21⅜c.; and Lamb & Flag, 21⅞c. England cables £95 5s@£95 15s.

Lead.—A large business has been done at steadily declining prices. Beginning with sales of 500 tons at 4·55c., sales followed of 900 tons at 4·50c., 800 tons at 4·45c., and 400 tons at 4·42½c., Common and Refined, for May, June, and July delivery. Nine hundred tons more were offered at 4·42½c., but found no buyers, and subsequently a sale was made of 100 tons July delivery at 4·40c., with some bidding at that figure. The great bulk of this lead was Pittsburg and Aurora desilverized, only a few hundred tons being Pueblo and Germania. It was distributed among at least a dozen buyers, the bulk going to the trade, which is now pretty fully supplied. The stock of the Richmond Company, and the lead in the West at the large works, were not touched, which leaves a visible supply of

Digitized by Google

nearly 10,000 tons, with a very restricted market in the East. At the close, lead is dull at 4·40c. for Common and 4·45c. for Refined.

Messrs. John Wahl & Co., of St. Louis, wire us as ollows to-day:

Our market has declined slowly since our last report. There are more sellers than buyers in the market, and hence prices are weak. We quote Refined 15@4·20c., and Hard lead nominally 4·10c.

From Chicago, Messrs. Everett & Post wire us as ollows to-day:

Our market is weak and dull. Sales during the week aggregate 500 tons at 4·25@4·20c. The market closes very quiet at nominally 4·20c.

Freights from Chicago are 23c. per 100 pounds.

Spelter.—This metal is dull, and is offered here from the West at 4·65@4·80c., according to brand.

Antimony.—Hallett's is firm at 9¾@9⅞c., round lots, while Cookson's is weak at 10¾@10⅞c.

Quicksilver.—The market is flat and devoid of all animation, quotable at 35@35½c. per flask.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, May 4.

American Pig.—The recent decline in quotations has had the effect of bringing out a few buyers, who feel safe in at least covering immediate requirements. They seem, however, generally to hold the opinion that something may be gained by holding off for a while to await developments, in the hope that even the unfavorably located furnaces will not give up without a struggle, and that some accumulated stocks may be thrown on the market. We have evidences that such has been the case with some of the furnaces in this State which have been selling iron recently at low figures. It will take some time before the situation is clear, and not until an actual turn begins to show will buyers come forward with any confidence, probably at too late a time then. We quote No. 1, $21.50 @$22.50; No. 2, $19.50@$20; and Gray Forge, which is comparatively in a strong position, $18@$19. There is very little doing in Bessemer pig, $21.50@$22 being asked for foreign at tidewater, while we hear of offerings of American at furnace in Pennsylvania at little less than $19. A fair trade is done in spiegeleisen of the higher grade at $32. Lower grade spiegel is neglected at $26.

Scotch Pig.—The arrivals appear heavy from the fact that the Anchor line put on two extra steamers. They foot up to 2000 tons this week. Steamer freights from Glasgow are firmer, being quoted 5@6s. The business during the week has been very small, and the market is dull at the following quotations: Coltness, $24@$24.50, ex ship; Glengarnock, $22 asked; Eglinton, $21@$21.25; and Summerlee, $24@$24.25. The last cable quotations at the New York Exchange are, May 2d: Eglinton, 49s. at Ardrossan; Glengarnock, 54s. 6d. at Ardrossan; Summerlee, 60s. f.o.b. Glasgow; Gartsherrie, 69s. 6d. f.o.b. Glasgow: Langloan, 68s. f.o.b. Glasgow; Coltness, 62s. 6d. f.o.b. Glasgow. Warrants were 47s. 4d.

Rails.—Business has been small, sales aggregating 10,000 to 12,000 at mill, at $38. Eastern mills are now well supplied for summer delivery, and are in the market only for partly August and fall delivery. England cables £4 17s. 6d.@£5.

Old Rails.—There is no business of importance to report, and quotations remain $23.50@$24 for Ts.

Scrap.—Scrap is without feature. We quote $25 nominally, ex ship.

Philadelphia. May 4.

Pig-Iron.—The outcome of the reduction announced last week in crude iron has been thus far in favor of a greater volume of business. The impression gains ground that the purpose of these reductions is two-old. First, to restrict the surplus output to actual quirements, and second, to induce buyers to come in and cover requirements. This wise policy is bringing about the intended result, and already a few furnaces have gone out of blast, and others will follow in a short time. Quotations for Foundry iron are given at $20@$22, for standard brands; but these figures are shaded for brands less well known, and the volume of business since Monday shows that consumers admit that these are the lowest prices likely to be reached. Some large transactions have been closed and others are on their way. Notwithstanding the low prices, however, the full requirements of the trade will not be filled because of fresh uncertainties likely to arise. A great deal of caution is exhibited; but as it is improbable that lower prices will prevail, consumers feel safe in taking care of from one to two months' production. The lowest prices for fair iron were $19.50@$21.50. Forge iron has been moving with a little more freedom of late, and at prices ranging from $17.50@$19 at furnace. Bessemer Iron is quoted to-day at $22@$22.50, with offers at $21, which is about the best that can be expected until the market settles. Spiegeleisen is in negotiation at $32.50. Scotch iron would sell at $24 for Coltness; $21.50 for Glengarnock.

Muck Bar.—Transactions in Muck Bar were closed at $34.50 for ordinary. Sales of Charcoal Blooms were made at $64 for better qualities, and $62 for common. A few lots of Anthracite were disposed of at $53.50@$55. There is less inquiry, and a further weakness is probable.

Merchant Iron is feverish and fluctuating between 2@2·25c., according to make and size of order. There is more movement in the market, both here and in the interior, because supplies in consumers' hands have reached very low limits. There will be no great activity until affairs in the Western end of the State are settled; and from present indications, they will be settled in a manner which will improve the market for finished iron and depress prices for crude. A few round lots of Bars were sold at 2·15c. for June delivery, which is about the best figure in a large way. Country mills have secured a few orders for ordinary iron at 1·85c.

Nails.—The active demand for nails which has been heretofore reported continues, and prices range from $3 in car-load lots to $3.25 in jobbing lots, with an active inquiry and steady demand. Building operations have taken a fresh start, and the stock of nails will be depleted if inquiries in hand result in business, as is most probable. A half-dozen fair-sized orders for structural iron were placed at shadings from recent quotations. Retail lots move at 2½c. for Angles and 3½c. for Beams and Channels.

In *Plate and Tank*, there has been a little activity, but not as much as is necessary to prevent buyers of large lots obtaining concessions. Prices have no very well-defined limits.

Steel Rails.—This week's transactions in Steel Rails in various Bessemer mills are large in bargain at about $39. A number of small transactions were closed at $39.50@$40. Steel rail makers are satisfied with the present turn of the market, and are confident that no further depression in prices will take place.

Old Rails are quoted at $24 for Tees and $27.50 for Double Heads. There are several inquiries in hand; but the offers are about a dollar below asking prices, and hence only occasional small lots change hands.

In *Scrap-Iron*, a dozen small transactions have taken place at yards at about $26@$26.50 for No. 1. Cast is moving slowly at $18@$19. Stocks are large.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, May 4.

Anthracite.

Coal in its last issue reviews the situation as follows:

The anthracite coal trade is in a demoralized condition. Individual operators and middlemen who must keep coal moving are selling at very low figures, which but very few buyers avail themselves of to cover any thing beyond immediate requirements. At no time has the policy of abstaining from any thing like purchases for the future been so general. Buyers have learnt a good deal during the past few years, and are not as willing to accept the fact that an entire year's prices are practically to be mapped out for them. This year, they are general in holding the opinion that a "break" must come. While recognizing the force of some of the arguments advanced in favor of this view, it must not be forgotten that the position of the companies is different now from what it has been in past years. They are financially much stronger, and can not be forced to market their coal at any price, to meet fixed charges and current expenditures. They are able and apparently willing to check overproduction; and from their point of view, it is better to mine and carry a smaller amount of coal and make a good profit than to allow the market to get beyond all control by a struggle for placing a large tonnage.

It is conceded that, with due allowances for the fact that the consumers and dealers are lightly stocked, the demand is not as good in many quarters as it has been, while, on the other hand, the output is large. The manufacturing industries are not doing well, and have become very cautious buyers, having besides, in their favor, low prices of soft coals. Notwithstanding all this, the position is not as desperate as many seemed ready to believe. The important point, and one upon which the happenings of the next few weeks will throw ample light, is the development of the Western trade. Should there be room for all, as there is reason to believe, then the companies may be strengthened in their position and buyers may find that they have made a serious mistake.

The only point on which we would dwell in addition to the above is, that the doings of the individual operators appear to be creating a feeling of irritation on the part of the leading companies, which may lead to some movement to check their plan of constantly sailing a little closer to the wind than the companies.

Bituminous.

The trade continues in a demoralized condition, and it appears that the Georgetown prices of Cumberland are very low, while Clearfield is cutting under pretty deep in this market. Four dollars is very glibly spoken of as the price in this market. We quote, however, nominally $4.15@$4.30 for Clearfield, and $4.20@$4.40 for Cumberland.

Horsford's Acid Phosphate

Imparts New Life and Vigor.

Dr. S. F. NEWCOMER, Greenfield, O., says: "In the cases of several aged men, who complained of forgetfulness and disinclination to think, move, or be spoken to, or harassed in any way, they told me it imparted new life and vigor."

KERL'S ASSAYER'S MANUAL
JUST READY.

The Assayer's Manual. An abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor of the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brannt, Graduate of the Royal Agricultural College of Eldena, Prussia. Edited by William H. Wahl, Ph.D., Secretary of the Franklin Institute, Philadelphia. Illustrated by 65 engravings. In one volume, 8vo, 301 pages. Price $3, *by mail, free of postage, to any address in the world.*

EXTRACT FROM THE PREFACE.

"In view of the well-known thoroughness and accuracy of Bruno Kerl's various metallurgical works, the preparation of the present edition of his abridged Manual of Assaying has been undertaken with the conviction that it would be doing a real service to English-speaking students and teachers of the subject. Though presented in very condensed form, every method of importance will be found to have received notice, and its practical value duly estimated at its proper worth."

CONTENTS.—GENERAL DIVISION.—I. Mechanical Manipulations. II. Chemical Operations. III. Assay Furnaces. IV. Assay Vessels. V. Balances and Weights. VI. Tools and Implements. VII. Assay Reagents. UNTIL further notice, the address of Mr. LUTHER WAGONER, of Messrs. WAGONER & HAMMOND, mining engineers, San Francisco, will be care of T. ROBINSON BOURS & Co., Alamos, Sonora, Mexico.

IT is reported that in a suit involving the patents of the Siemens regenerative furnace and the Ponsard furnace, the latter has been decided to be an infringement of the former. The case came up for trial in Philadelphia.

PROF. WILLIAM P. BLAKE has gone to Tombstone, Arizona, where he will probably remain during this month, in attendance as expert for the Copper Queen Company, in the suit of Copper Prince *vs.* Copper Queen, which is set for trial on the 17th at Tombstone.

THE outlook in the Western iron trade is not promising. The manufacturers held a meeting yesterday, at which no formal action was taken, but which gave occasion for an interchange of opinion, the drift of which appears to have been decidedly against the acceptance of any concessions on the part of the men. The position favors the makers, and they are not likely, in view of the demoralized condition of the trade, to yield in their demands.

AFTER many years of hesitation, due to a number of causes, the basic Bessemer process has been adopted by one of our great steel-works. It has been repeatedly stated that the Edgar Thomson works had been blowing in a basic converter; but so far as we can learn, the process is not a part of the regular practice. The Pennsylvania Steel Company, of Harrisburg, under the management of Major BENT, has recently begun regular work in making steel from phosphoric pig under the THOMAS and GILCHRIST patents.

FROM Michigan come glowing accounts of the development of very important deposits of rock-salt, which threaten to make the future of the Syracuse District a more problematical one than it now is, and promise to create a formidable rival to the newly-discovered Warsaw District and the older Saginaw and Canada salines. Making due allowance for the optimism which always seems to buoy up young enterprises, the new Marine City discoveries appear to have all the elements capable of making a rapid development possible. From an elaborate account in the Detroit *Evening News*, written evidently by one familiar with the industry, it appears that, a little more than a year ago, Mr. CROCKET MCELROY, of Marine City, began putting down a well at that point, and at a depth of 1633 feet struck a deposit of rock-salt, into which the hole penetrated for 115 feet, without passing through the salt. It appears that, in passing southwestward successively by Inverhuron, Kincardine, Goderich, Warwick, and Petrolia, in Canada, to St. Clair and Marine City, the salt is struck at increasing depth and in greater thickness, the wells at Detroit, farther southwest, apparently not having gone deep enough to strike the main body. It is urged in favor of the Marine City District that it combines the advantages of a pure, strong brine, cheap fuel, and proximity to the high-roads to the greatest markets.

ACID mine water is getting to be an intolerable nuisance in some of our collieries, and it may be of interest to summarize what has been done in other countries in trying to get over the trouble. At the mines of the Königshütte, the lack of feed-water for the boilers of the colliery and the adjacent blast-furnaces made it necessary to devise some means of using the acid mine water. As early as 1858, large ponds were provided above ground in which the mine water was mixed with milk of lime, which was afterward allowed to settle ; but the plant was abandoned after it was found possible to get sweet water elsewhere. This arrangement did not, however, overcome the trouble experienced in keeping the pump-mains, etc., from corroding rapidly. To meet this, the water-pipes were coated internally with a layer of cement, and the plungers and cylinders of the pumps were made of bronze. The managers of the mines some years ago decided to get at the root of the evil, and began the undertaking of neutralizing the acid waters in the mine, before they reached the pumps, using milk of lime as a neutralizer. The slime is pumped to the surface without causing any trouble in choking valves, etc., as it is so finely distributed and light; and since the plan has been in use, no trouble has been experienced from corrosion. Settling-tanks are provided above ground. The quantity of water to be raised by the pumps of the Krug colliery, in which this system is in use, is 165,500 cubic feet daily, while the capacity of the four settling-ponds is 200,000 cubic feet. A test of the water with litmus paper is made daily.

THE English mining journals contain this week two reports of companies, which, though operating in widely different parts of the world, are yet of great interest. One relates to the Panulcillo Copper Company, one of the few public companies working Chili copper properties; and the other to the Tharsis Sulphur and Copper Company. From the first we learn that it required 57,864 tons of ore to produce 6272 tons of regulus, containing about 2924 tons of pure copper, so that apparently the yield of the ore was only five per cent. The consumption of fuel was 7288 tons of coke and 3906 tons of coal, costing $186,540.22 ; the total cost, including $98,277.34 loss in exchange, footing up to $840,498.96 ; while the receipts from the sale of regulus were $1,077,018.16, leaving a net Chili profit of $236,519.20. During the past three years, the company has paid £65,000 dividends on £200,000 capital, has wiped out an indebtedness of £67,515, and has £10,000 undivided profits in the treasury. The company is making efforts to reduce the cost by the introduction of crushing and rock-drilling machinery, so that, notwithstanding the low grade of the ore, the high price of fuel, and the low price of copper, it may be able to hold its own.

The Tharsis is one of the famous pyrites mines of Spain. In 1882, it shipped 212,218 tons of pyrites, 5534 tons of precipitate, and 184,059 tons of iron ore, and yielded a profit of £335,676, distributing £314,479, or 27½ per cent, dividends on its paid-up capital. It should be noted, however, that the Tharsis Company is exceptionally well situated in having no trouble in marketing its pyrites, some of the greatest alkali manufacturers being among its customers, so that it has been as yet little affected by the decline in the Leblanc soda industry.

THE Prussian Fire Damp Commission has begun active work, and is printing occasional notes of progress which give promise of a thorough study of the great questions at issue. Herr A. HASSLACHER, one of the members, has compiled statistics, according to which forty-three out of the 377 collieries of Prussia are worked through tunnels, twenty-five by tunnel and deep shafts simultaneously, and 309 by shafts exclusively; 174 collieries show fire-damp, while 203 are free from it. The former employ 103,419 men and produce annually 27,631,404 metric tons of coal, while the latter are worked by 52,278 men and yield 14,641,709 tons of coal, so that 65·4 per cent of the production comes from fiery mines, which employ 66·4 per cent of the entire force. The proportion, of course, is very different in the various districts. In Upper Silesia, the percentages of the product and of the force of the fiery mines are 7·4 and 7·0 respectively. In Lower Silesia, they are 58·0 and 60·6; in the Aix-la-Chapelle District, 82·6 and 80·3; in the Ruhr District, 85·4 and 85·3; and in the Saar District, 94·7 and 94·5. The ventilation in Prussian collieries is as follows: Natural draught is relied upon in 129 mines; natural and occasional artificial ventilation, 29 mines; while exclusively artificial ventilation is resorted to in 219 collieries. In the latter, there are in use 14 injectors, 23 air-compressors, 109 chimneys, 169 ovens, and 136 ventilators, distributed according to make, as follows: Guibal, 74; Rittinger, 9; Zimmermann, 3; Fabry, 17; Kaselowsky, 3; Winter, 3; Pelzer, 11; and Körting, 2.

Another direction in which investigation has begun is the chemical examination of the air from the upcast shafts of a number of German collieries. Dr. SCHONDORFF, of the Bochum laboratory, has found that the air coming from the Kaiserstuhl shaft of the Westphalia colliery contained 1·05 per cent of fire-damp, although the ventilation of the mine was going on at the rate of supplying 36,000 cubic feet of air per minute. The air coming out of the new shaft of the New-Iserlohn colliery, a sadly famous one in Germany, contains 1·5 per cent of fire-damp when over 50,000 cubic feet of air are delivered into the colliery each minute. It will be readily understood how easily a mine can get to the dangerous point as soon as the slightest mishap affects the ventilation.

THE programme of the summer meeting of the American Institute of Mining Engineers at Roanoke, Virginia, has just been announced. The following gives a summary of the excursions and the time appointed for the holding of sessions:

Monday, June 4th.—The opening session will be held in Roanoke, on Monday evening at eight o'clock. Addresses of welcome will be made by Mr. J. B. AUSTIN and Mr. LUCIEN H. COCKE, Mayor of Roanoke. Reading and discussion of papers.

Tuesday, June 5th.—Visit to Lynchburg by special train on the Norfolk & Western Railroad. On arrival at Lynchburg, a train, kindly provided by the Richmond & Alleghany Railroad, will take the party to the iron mines on the James River at Riverville, and, if time allows, also to Stapleton. In the afternoon, a session of the Institute, for the reading and discussion of papers, will be held in the hall of the Lynchburg Chamber of Commerce. Return to Roanoke in the evening.

Wednesday, June 6th.—Local excursions around Roanoke, visiting the Crozer Furnace, Upland and Houston mines, Rorer Iron Company's mines, and the Roanoke Machine-Works. Evening session.

Thursday, June 7th.—Excursion to Pocahontas (Flat-Top Coal-Fields), and the Southwest Virginia Improvement Company's coal mines and coke-ovens. Returning, the Ripplemead mines and Bertha Zinc-Works will be visited. The night will be spent at Abington or Wytheville.

Friday, June 8th.—Excursion to the Cranberry magnetic iron ore mines in East Tennessee, returning to Roanoke in the evening.

On returning home, via the Shenandoah Valley Railroad, members can stop at the Natural Bridge and the Caves of Luray. Those wishing to visit the Cripple Creek ore region can do so by remaining after the close of the meeting, the Norfolk & Western Railroad having kindly extended the courtesies of the road for this purpose.

Mr. J. H. BRAMWELL is chairman, and Mr. J. H. SYKES, secretary of the local committee in Roanoke, and Capt. C. M. BLACKFORD chairman of the committee in Lynchburg. It is urged that members promptly notify the Secretary of the Institute, Dr. T. M. DROWN, Easton, Pa., of their intention to attend the meeting.

CALIFORNIA FREIGHT RATES.—California freight rates from the Atlantic seaboard are said to have been cut severely of late. The California traffic has been carried from Eastern ports under special contracts, the routes over which it passed being under the control of the Central Pacific. The rates on freight from New Orleans to San Francisco are the same as from Chicago to San Francisco. From Galveston they are the same as from Kansas City. In order to divert the freight from the trunk lines, the lines of steamers from New York to the gulf ports have been cutting rates, making the through rate 25 per cent less than recent contract rates. The Texas Pacific is said to have joined in the cut, making a rate as low as $4, but raising it to $5. The Delaware & Lackawanna Railroad, which is not in the trunk-line pool, and the Union Pacific & Santa Fé route, are said to have already joined in the cut, and are taking a reasonable share of such traffic.

American Pyrites for Acid-Making.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: I have read with interest the timely and useful article of J. D., Jr., in your issue of May 5th, on the subject of pyrites-burning in this country, believing fully that the time has come for our acid-makers to follow the example of their European rivals, and to make sulphuric acid from pyrites.

I regret that J. D.'s article should contain an inaccuracy on one very essential point, namely, the supplies in this country open to the manufacturer. He has, of course unintentionally, so utterly misrepresented the largest and best pyrites mine in New England that I feel warranted in demanding space to correct him. He says: "From Maine and New Hampshire come some pyrites; but it is so contaminated with blende and galena . . . that its value for acid-making is seriously impaired."

The only mine in either of these two States producing pyrites for the market is, I believe, the Milan mine in Coos County, New Hampshire, which has been worked continuously for the past eighteen months, and is now ready to furnish any amount of first-class pyrites for acid-making.

As we have worked the Milan mine with an open cut, as well as with a shaft and drifts, we know the quality of the ore. In a width varying from 14 to 40 feet, there have been found various metals, including several veins of copper, some narrow ones of zinc, and occasional pockets of galena. As we have built a smelter at the mine, no galena or copper is allowed to go into the pyrites pile, as will be evident to any reader. The lead, therefore, only exists in the imagination of J. D.

As to zinc, it happens at Milan, as I understand it has elsewhere, that the first 40 or 50 feet of ore, working from the surface, contained some streaks of zinc ore. These are plainly visible in the mundic, and are as easily separated as two layers of stone would be. Below fifty feet, these streaks, which occur only on one side of the main vein, disappear: the great body of mundic has always been free from zinc.

I can not agree with J. D. that zinc impairs the value for acid-making. Its presence reduces the percentage of sulphur; so would an equal amount of silica. But, be that as it may, we keep all of this grade by itself, and sell it as second-grade ore, and find appreciative customers for the little we produce.

But as to our main bodyof pyrites, allow me to quote the opinion of a competent witness:

"In answer to your inquiry in regard to your pyrites, I would say that I have found no difficulty whatever with them in the manufacture of sulphuric acid. They burn freely without scarring or clinking; and I have found only the slightest traces of arsenic, so small as to be utterly insignificant. WILLIAM ATWOOD."

This testimony from the well-known manager of the Atwood Lead Company is doubtless sufficient, although I could refer to other well-known concerns.

But the best guarantee I can offer is the ore itself; and I am ready to send samples to any acid-maker who wishes to try it; and I am ready to contract for any amount to be bought and sold on the samples.

As to the percentage of sulphur, I have the certificates at hand of three lots sold during the present year, analyzed by Mr. Amory Austin, of this city, as an expert. These stand at 48·48 per cent, 49·30 per cent, and 50·29 per cent, and these figures mean, of course, that the pyrites are equal to any found in Spain or America.

I hope I have not exceeded due bounds in correcting the error of J. D. I might refer all inquirers about the quality of the mine to Mr. J. H. Huntington, the well-known mining expert, who recently examined it at the request of persons not connected with our company. But business men will prefer contracts to opinions, and these I am prepared to make. I am sure that J. D. intends to give true information, as he points out a defect in the otherwise excellent ore from Rowe, namely, its softness. The Milan ore is firm and strong, and makes the minimum of smalls. The Rowe ore, however, is no more free from arsenic than the Milan, as I am well informed. Both ores give *a trace only*, under the most delicate tests. And by a trace is meant an amount too delicate to be weighed or estimated. It is not the one quarter per cent of the Spanish ores, but an amount which, as I was told, will be found in commercial acid made from brimstone.

Lastly, while claiming that the Milan ore is equal to any produced by any mine, I do not claim to be able to supply all the acid-makers in the country. Our mine is on the Grand Trunk Railroad; and wherever that line reaches, we can compete with all others. We are 100 miles from Portland only, and can therefore supply acid-makers on the sea-board. Other mines will doubtless have special advantages in supplying other markets.

It is, however, a point worth considering by our acid-makers whether they can at any price afford to use pyrites like the Spanish and Canadian, which undeniably contain arsenic. Even for the manufacture of fertilizers, the presence of a deadly poison in the acid must be a hinderance. I think that our American supplies will be free from this evil, whether found at Milan, or Rowe, or Virginia.

I do not propose to undervalue any mine, either intentionally or accidentally, as I believe the market is large enough for all, and that the prosperity of the country will be greatly increased by the establishment of this new and important industry. I am convinced that our acid-makers can only find out their best and cheapest source of supply by testing samples and comparing prices; but it is beyond doubt that every acid-maker on the sea-board or near a line of railroad is perfectly safe in erecting pyrites-burners, with the certainty that he can procure a supply of ore at reasonable prices; and that the figures given in J. D.'s article will be a safe guide. I remain yours very truly, WILLIAM H. WHITMORE,

BOSTON, MASS., May 8, 1883. Treasurer Milan Mining Company.

OFFICIAL STATEMENTS AND REPORTS.

THE TOMBSTONE MILL AND MINING COMPANY, TOMBSTONE, ARIZONA.

The annual report of the Tombstone Mill and Mining Company for the year ended March 31st contains a brief summary of the condition of the company by the board of directors, and a very full and valuable account of the operations of the company during the year, by Prof. John A. Church, the superintendent.

Beginning with the report of the directors, it should be noticed that as yet no decision has been reached by the Arizona Supreme Court in the case against the Way Up Mining Company, an appeal to that court having been taken from an adverse decision by the lower tribunal, which only temporarily, it is believed, cuts off the company from following the rich ore-body in the Good Enough claim. The gross debt of the company has been reduced from $401,951.09 to $355,353.02, no deduction being made for assets, of which the supplies on hand already amount to $48,697.48. Members of the board assumed the debt, taking six per cent bonds to the amount of $446,000, of which $85,000 have been redeemed, leaving bonds outstanding, payable in 1883, $115,000; in 1884, $116,000; and in 1885, $130,000. It is expected that the balance of $251000 due the San Francisco Bank will be paid before the 1st of July. The working results of the treatment of the tailings have been so encouraging that the board declined to entertain the proposition made to provide for the immediate extinguishment of the debt by their sales. Professor Church expects to realize a profit of $660,000 from the tailings now on hand, when worked in connection with manganese ore from the Lucky Cuss mine, belonging to the company.

Professor Church gives the following as the product of the company:

	Fine silver.	Fine gold.	Lead.	Market value.
Mill	532,373 ozs.	1.813 ozs.	.....	$603,265.38
Furnace	40,884 "	299 "	132 tons	55,062.31

The average fineness of the bullion from the mill was 835·74 in silver and 2·85 in gold.

With the deduction of 16 per cent, the milling ore, which also represents the product of the mines separate from the product of the tailings, has had an average value as follows:

	Ounces.	Currency.	
Gross value of ore per ton silver	32·190	$34.92	
" " gold	0·180	3.72—	$38.64
Yield per ton silver	24·710	$26.81	
" " gold	0·084	1.74—	$28.55

Percentage extraction of silver, 76·76; gold, 46·67; average, 73·88.

The production of the different mines during the year was as follows:

	First 6 months.	Second 6 months.	Total.
Main works	3,346	2,305	5,651
Combination	8,006	1,468	9,474
West Side	1,281	4,253	5,534
Lucky Cuss	78	802	880
Defense	. ....	50	50
Tribute	.....	116	116
Northwest	287	.....	287
Limestone and fire-clay	... ..	(61)	(61)
Total	12,998	8,994	21,992

A leading event of the year is the practical transfer of mining work from the Good Enough and Tough Nut to the West Side mine, and the rise of the latter to the position of the most promising mine in Tombstone District. At present, the two mines first mentioned are almost idle, after yielding nearly 67,000 tons of ore and probably ninety-five per cent of all bullion the company has produced. The reasons for this change of operations are twofold: In May, 1882, the case of this company against the Way Up Company was decided against the former, and though an appeal was taken, and has been argued, no decision has been reached yet, and operations on the Good Enough mine have necessarily been controlled by the first decision. The Way Up mine adjoins the Good Enough, in such a position as to intercept 600 feet of the vein as it dips into the earth. The result of the suit not only deprived the company of about $100,000 worth of ore, but prevented it from following the vein beyond the lines in a part of the claim, and made it imprudent to do so in the remaining part. All the *known* ore-bodies in the Good Enough have been exhausted, and most of the ground within the claim has been prospected, leaving the future almost entirely to the finding of ore within the vein, but outside of the surface lines, where the law allows the company to search for it.

The stoppage of work on the Tough Nut was due to very different causes. Like its neighbor, the *known* ore-bodies in this claim are exhausted, and little ground remains unprospected within the lines; but the dip of the ore is protected by the Defense and Survey, two claims belonging to this company, and legal complications are not looked for.

But neither of the two mines on the Tough Nut claim was well opened. The Northwest never had permanent works, and the main shaft at the other end of the claim was badly planned. The expense of prospecting became so heavy that it was decided to take advantage of the favorable position of the Survey and Defense and utilize them to prospect the Tough Nut. The West Side vein, which runs through the former, has been opened with great success, and some work has been done on the Defense, which will very soon be attacked more vigorously. As yet, the Tough Nut has not been reached from the West Side, because the independent development of the latter has been so successful, and perhaps no effort will be made to reach it until another level is opened; but the ore in the latter mine works in such a way as to show the wisdom of the general plan adopted.

Mr. Church says: "I do not believe that either the Good Enough or Tough Nut is exhausted, but am strongly of opinion that the ore-bearing formation is productive below the depths we have reached. Our deepest level is only 268 feet deep in the Tough Nut, and 300 feet in the Good Enough, and the formation is not one that lies level, but dips with considerable steepness, probably thirty degrees at least. The condition of the deepest working on the West Side almost demonstrates the continuance of ore to a greater depth than we have yet reached in the Tough Nut, and I believe the future work will reveal important ore-bodies lying between the center of the West Side claim and the Tough Nut side-line.

The following detailed account of the West Side mine will be of interest: This mine is now the most promising claim of the company. lies nearly at right angles to the Tough Nut, is 1496 feet long, and h an extension 140 feet long in the Survey, which abuts upon the Toug Nut. Vein croppings run almost continuously through the ground for a length of 1300 feet.

Three shafts known by numbers have been sunk on the vein, and are connected by drifts underground. No. 1 is 523 feet north of the south end-line of the claim; No. 2 is 470 feet farther north; and No. 3 is 232 feet north from No. 2. Drifting on the vein extends 230 feet south from No. 1 and 180 feet north from No. 3, so that the vein is opened for a length of 1210 feet.

Ore is found through nearly the whole of this distance, sometimes in a thin vein or in bunches, sometimes in continuous bodies from 100 to 200 feet long, and from 2 to 10 feet thick. The greatest thickness yet opened is on the 3d or lowest level. Owing to the character of the vein, it has been found advisable to open levels at successive depths of 75 feet, so that the 3d level is 230 feet below the surface, and 238 feet below the timbered mouth or "collar" of No. 3 shaft. This level is also 72 feet above the 3d level of the Tough Nut, and it is intended to carry this or the 4th level northward to a connection with that mine. The West Side vein crosses a gentle hill, and rises to the crests of two adjoining hills, and the principal ore-chute lies in the central elevation. There are signs that each one of these hills will carry its separate important ore-body, the different masses being connected by smaller bunches and thin veins of ore. This central hill contains shafts Nos. 2 and 3. Most of the mining already done has been in the central mass, which appears to be about 180 feet long, and from one to ten feet thick, with occasional cross-veins running for twenty feet east and west. It stands in the vein with an inclination northward, the vein itself running north and south and dipping slightly east. This bonanza reaches from the surface to and below the 3d level, and its croppings cover the whole space between shafts Nos. 2 and 3. The work of opening the 3d level between these shafts was finished in March last, and sinking was immediately resumed and is now 25 feet below that level. The ore continues throughout this depth, and has been opened on the 3d level for a length of 85 feet. Since the West Side was opened, the bullion made has increased materially in gold. In general, the grade of the ore is not remarkably high, though it is good and seems to be improving in depth. In fact, the ore itself is of excellent grade, quite as good as any thing ever mined by the company, but much of the rock that lies next it is so loose and crumbling that it is impossible, in a vein of the dimensions given, to keep the ore clean. As sent to the mill, the ore probably contains about 40 ounces silver and half an ounce of gold, and is worth in legal value $63, and in market value about $54.58 per ton at current rates. At present, the prospects of this mine are very bright. There appears to be in the mine at least one half more ore than was taken from it during the last year, or say 8000 tons. The ore mills well, and, if large ore-bodies are found, the mine will be the cheapest to work of all the company's properties, the rock being much easier to work than in the Good Enough or Tough Nut. Hitherto, the thinness of the vein has made the work costly.

The Lucky Cuss is the seat of large deposits of silver-bearing manganese ore, which is now mined as a flux for use in the furnace. Two lines of these deposits are known. That on the north end appears to be a continuous vein, while in the southern line the ore-bodies are entirely separated from each other, though they appear to lie in two definite directions. The ore is quite a pure and rich oxide of manganese, containing about 10 per cent of silica and 25 ounces of silver. As one half the smelting charge is manganese, this flux affords quite an important supply of precious metal. Probably 10,000 tons of the flux will be needed with the concentrates that can be made from the tailings now on hand, and there is every prospect that the Lucky Cuss can supply it. So far, only 880 tons have been mined. The Lucky Cuss was one of the first mines to be opened in Tombstone, and the resumption of operations upon it has been matter for congratulation in the camp. The country-rock is a hard white limestone, in which the manganese occurs in chutes, which have a small horizontal section, but appear to be quite persistent vertically. A depth of 100 feet has been reached in three places, and in all the ore is continuous from the surface. In one, it forms a cylindrical body, 10 to 12 feet in diameter; in another, it is lens-shaped and about 3 by 40 feet in section; and in the third, the ore-body is longer. Small bunches of galena and carbonate of lead occur in the manganese, and these are always rich, usually running up to 200 ounces silver per ton. With the manganese, the rule is, that the richer in silica the richer also in silver, though we have sometimes had a mixture of manganese and lime-spar that was richer than the average. The richest ore is too siliceous to serve as a flux and too manganiferous to mill well, so that we are able to use it only with great slowness. All the work done in the claim is in preparation for the extraction of ore, and as this is the most expensive part of mining, the cost has been temporarily high. So far, the ore has cost $10.18 per ton, but when the ore now uncovered is removed, the cost per ton will be much less.

At all points of extraction, a well-tried system of handling the ore has been introduced. Bins, holding from 40 to 500 tons, are built at each hoisting-shaft, and large enough to allow the large ore-wagons to load from them without shoveling. The cover of the bin forms a sorting-floor, to which the ore from the mine is dropped, first running over a screen which separates the fine stuff. The coarse ore is picked over by hand, and the waste removed. This is a costly work, and also causes some loss, but the distance of the mill and the cost of hauling make it necessary and profitable.

In the following statement, the expenses of mining and milling are shown in detail. The item of "outside mining" refers to the cost of extracting a quantity of smelting ore from a vein near the mills, on property not belonging to the company:

MINING (21,903 TONS).

	Total.	Per ton
Labor	$190.531.00	$8.70
Contract	4,372.10	0.20
Supplies	34,703.48	1.58
Repairs and renewals	980.60	0.05
Ore-hauling (21,064·85 tons)	63,204.65	3.00
Total	$293,791.83	$13.53

Total of all expenses		$543,926.69	

There is now on hand, of supplies by inventory:

Mine supplies	$4,187.01	.....	$0.19
Mill	9,180.02	.....	0.43
Furnace	29,280.93	$42,647.96	.....

The record of the year shows a considerable decrease in all expenses which are within control. Mining and milling expenses are $19.86 per ton, against $23.96 for the previous year, and, including extraordinary expenses, the comparison is as $21.76 to $27.16 for the same items. The improvement commenced in the latter half of the first year, and has been carried forward with increasing success. The comparison is fair, with the exception that ten cents per ton should be deducted from the first year's average expense for cost of the first trials in concentration, an item that is not included in the computation for this year.

The reducing machinery of the company has necessarily followed the fortunes of the mines. Up to June, 1882, thirty-five stamps were at work; but the falling off in ore supply then caused a reduction to twenty stamps, and the failure to find new ore-bodies in the well-worked ground under the surface of the Tough Nut and Good Enough finally compelled a further reduction to ten stamps. In March, 1883, this decrease was stopped, and fifteen stamps were run nearly all the month, a scale of work which present prospects indicate may be maintained in future. From 2800 tons a month in April and May, 1882, the ore treated sank in quantity to 1800 tons monthly for the seven following months, and finally to 881 tons in February, rising again to more than 1000 tons in March, 1883.

The yield of bullion did not fall off proportionately to the ore. Indeed, the heavy output of the early months of the year was due to the fact that large masses of low-grade ore existed which could be worked at a small profit. The estimated market value of the ore per ton was for the four periods named, $25.25, $31, $41.79, $52.34. On this account, the reduction in output and milling has been profitable by reducing expenses materially, while the product did not fall off in the same proportion. The amount of ore treated by 35 stamps was 5716 tons, by 20 stamps 12,718 tons, by 10 stamps 1877 tons, and by 15 stamps 1163 tons; total, 21,474 tons. No changes of moment have occurred in the mills, except the re-introduction of chemicals, that is, salt and bluestone, in April, 1882, a change in the character of the ore making this step necessary, and the use of sodium amalgam in the last months of the year, in an effort to save a larger percentage of the gold in West Side ore. In this we have been partially successful.

At present, the Corbin Mill only is running. No concentration takes place there, but machines will soon be introduced for the purpose. At Gird mill, amalgamation has stopped. The furnace and concentrators are situated there. The mill accounts show the following work and results during the year:

Tons ore received at mills		21,186
Tons ore milled		21,474
Average battery assay, ounces	32·19 silver	0·18 gold
Average tailings assay	8·01 silver	0·10 gold
Average per cent saved	76·07 silver	44·44 gold

	Total.	Per ton ore.	Per cent.
Pounds (avoir.) amalgam produced	266,026·00	12·390	.....
Pounds (avoir.) retort metal	46,888·00	2·180	.....
Retort metal ratio to amalgam	1 : 5·67	.....	.....
Troy ounces retort metal	682,637·00	31·790	.....
Troy ounces bars	641,978·00	29·890	.....
Loss in melting	40,659·00	1·900	5·95
Average fineness of bars silver	823·90	.....	82·39
Average fineness of bars gold	2·80	.....	0·28
Troy ounces in bars silver	528,946·02	24·630	.....
Troy ounces by assay silver	519,010·00	24·180	.....
Gain over assay silver	9,936·02	0·450	1·91
Troy ounces in bars gold	1,821·99	0·084	.....
Troy ounces by assay gold	1,444·52	0·067	.....
Gain over assay gold	377·47	0·017	26·13

These results illustrate one of the peculiarities of work in Tombstone mills, and I believe all the mills in the district have the same experience. Taking the battery assays as the standard of value, and deducting the assay of the tailings, the bullion product is invariably a *plus*, or in excess of the apparent extraction of metal, as shown by the assays. This is the more noticeable with high than with low-grade ore. Necessarily, the error is either in too low assays of the battery pulp or in too high assays of the tailings, and probably it is the former, as indicated by our results in concentration, which are a check upon the tailings assays. Repeated efforts have been made in this company's mills to correct the error, but without result.

The *plus* in gold is still more striking, if the percentage is considered. The gold assays are made once a month from the collected buttons of the daily assays; and as the latter are made upon samples, taken every half-hour throughout the year, there is no reason why the samples should not be true averages, especially as all questions connected with the mode of sampling have been carefully considered. There is one source of error which may explain the small *plus* of silver. The sample is taken from the stream of pulp at the end of the battery launder, and as the inclination of this trough is somewhat insufficient, an entirely free flow of the pulp is not secured and the heaviest portion of the ore settles in it, removing a certain part of the richest ore from the sample. This is undoubtedly the source of the error in silver returns; but it can not explain the remarkable error in the gold, unless there is free gold in the ore heavy enough to settle almost completely in the trough, leaving only the mineralized gold to fall into the sample dipper. Free gold may exist in the ore, but it is not coarse enough to be visible, and it is difficult to see how fine scales should settle so readily.

MATERIALS CONSUMED.

	Total.	Per ton.
Cost of fuel	$22,838.56	$1.06

Hardware	555.62	0.03
Tools	240.42	0.01
Sundries	3,018.03	0.14
Labor	56,892.43	2.65
Total	$105,501.42	$4.91

	Total.	Per ton.
Quicksilver, pounds	21,629	$1.00
Salt, pounds	110,094	5.12
Bluestone	22,366	1.04
Cords wood	2,526¾	0.12
Days' labor	13,011¼	0.60

The quantity of quicksilver here given is that which was *added* during the year, without taking account of what was in the pans in the beginning and end of the twelvemonth, and, as there has been a reduction in quantity of ore, the amount given per ton is undoubtedly too low.

In regard to the treatment of tailings, Professor Church says: When I examined the mines of this company in the year 1880, the problem of utilizing the tailings had already assumed importance, though only about 15,000 tons of ore had been worked. Now nearly five times that quantity is represented in the tailing-beds. The advice then given was to concentrate the tailings and smelt the concentrates with manganese from the Lucky Cuss mine, where important bodies of this ore, carrying from fifteen to thirty ounces of silver per ton, are found.

The plan was beset with difficulties; for the fine condition of the material prevents good work in concentration and hinders smelting, and manganese as a flux, though not a positive novelty, had not been successfully relied upon, I believe, as the sole dependence of a furnace that has no access to iron either in its ores or flux. But this advice was given for the reason that the remilling of tailings has been almost uniformly a failure, and nothing was to be looked for from this mode of treatment, while concentration and smelting offered a promising though untried field. The result has been a great success, the treatment of about 3500 tons of tailings having paid all the costs of construction and work and a profit besides. The treatment includes two branches, concentration and smelting, which will be considered separately.

After preliminary experiments in 1881, six Frue vanners were obtained from Messrs. Adams & Carter, of San Francisco, and regular work commenced at the end of February, 1882. The records which are summarized in the table given below cover the whole of the intervening period, or thirteen months. In January, 1883, two revolving buddles or round tables were built and worked with such success that others have been ordered and will be put in at once.

The problem presented is one of the most troublesome in ore-dressing. All the material is in the finest condition, having been reduced to a *maximum* of $\frac{1}{16}$ and $\frac{1}{10}$ of an inch diameter, to prepare it for amalgamation, and in this process the ore is ground for hours, not only increasing the proportion of fine slimes, but making the latter sticky by trituration. The greatest loss in concentrating has been due to the fact that these fine slimes run over the table, without yielding their silver. This defect, however, is now cured mostly by the buddles. The method adopted is as follows: The tailings are thrown into an agitator, where they are stirred with water, and the heaviest sands settle, giving the first concentrated product. The pulp is then run on the Frue vanners, where a finer concentrate is obtained. After concentrating, the tailings are raised to a buddle, which removes about one third of the silver still remaining in them. From this buddle the finest material, which still runs off without concentrating, will be delivered to a second buddle of lighter slope, and concentrated there. The buddles have not been running long enough to furnish an estimate of their production. In this way it is hoped to raise the extraction of gold to a satisfactory point, that portion of the work having always been defective in amalgamation.

The concentrating mill is situated close to the Gird mill, and the distance from the tailing-beds has always caused a large expense for wheeling. At present, this difficulty has been increased by the removal of the nearest tailings, and the mill will now be moved to the area cleared away in the tailing-bed. For this purpose, an engine has been

Digitized by Google

provided, and the new machinery will be erected at the new point. The purchase of this machinery was made necessary by the fact that the works as first established were not large enough to keep the furnace constantly supplied.

Concentration has now been going on for thirteen months, and the whole of this period is included in the table of results given below. The value of the tailings in lead is not determined by daily assays, as the silver is, but the proportion of lead is estimated at 8 per cent.

	Tons.	Assay per ton. Silver, oz.	Gold, oz.	Lead, p. c. Per cent.
Mill tailings treated	11,467	13·21	0·22	(?)8·00
Production,				
From the agitator	93	52·65	0·48	23·20
From the Frue vanners	1,483	45·23	9·58	30·90

Percentage saved by weight..... 13·31
Weight of tailings required to make 1 ton of concentrates, 7·5 tons.
Percentage saved, by value: Silver, 41·29; gold, 34·09; lead, 50·61.

COST OF WORKING.

		Tailings.	Concentrates.
Labor	Total, $9,672.40	Per ton, $0·843	$6.34
Supplies	" 873.13	" 0·076	0.57
Total	$10,545.53	$0·919	$6.81

The extraction of silver in the mill has been about 80 per cent and of gold about 45 per cent, and the treatment of the tailings increases this by 41·29 and 34·09 per cent respectively, so that the final results are as follows:

Silver, extracted by amalgamation	80.00 per cent.
" " concentration, 20 by 41·29	8·26 "
Total	88·26 per cent.
Gold, extracted by amalgamation	45·00 "
" " concentration, 55 by 34.09	18·70 "
Total	63.70 per cent.

These results are not satisfactory; but the improvements in concentration will add probably 4 per cent to the silver and perhaps 12 or even 15 per cent to the gold. If these results can be reached, the whole method of treatment will be in a higher state of perfection than has been obtained heretofore in American milling.

In September, 1882, the building of the furnace was completed, and a short trial-run was made, which could not be continued nor resumed for some time, owing to the failure of the coke supply. Afterward, several short runs were made. The fine condition of the materials and the low fusing-point of the manganese, combined with the complete absence of sulphur in the charge, caused great trouble. The impurities of the charge collect in the form of a hard lead, which separates from the remaining metal and sinks in the lead bath, obstructing circulation and cooling the crucible. The use of manganese as a flux has approved itself, and the company enjoys the great advantage of using as flux a material that furnishes an important amount of silver, and is also mined on their own ground. To meet the sandy condition of the concentrates, a brick-machine has been purchased, and the concentrates will be made into bricks, using fine slimes as binding material. This work has been done by hand and with success, and the machine will undoubtedly improve upon the hand work.

The lead bullion made has been sent to refining establishments in the East. It is of good grade, fair softness, and carries a higher proportion of gold to silver than the mill bullion. As a considerable part of the silver is derived from manganese ores without gold, this proves that the reworking of the tailings will be especially valuable in saving gold. Four general classes of expenditure are necessary to the working of the furnace, as shown in the following table. The sinking fund charged against construction is not calculated by time, but upon the proportion of tailings that have been worked, and is somewhat high, as no account is taken of new ore that will be concentrated in future. Construction includes both concentrators and furnace:

	Expended.	On hand.	Total.
Construction	$603.97	$12,921.01	$13,524.98
Manganese (mining and hauling)	6,046.58	6,810.77	12,857.35
Concentrates and ores	6,043.99	7,927.62	13,971.61
Furnace supplies, hauling and labor	16,522.70	14,542.54	31,065.24
	$29,217.24	$42,201.94	$71,419.18

Among these items, purchased ores and hauling of them amount to $1889.43, and purchased manganese and its hauling to $2680.03. These expenditures were made in testing the ores of the district, and are not absolutely necessary to the work of the furnace, as the company has similar material in its own mines.

The furnace work has consumed the following materials:

	Tons.	Percentage of charge.	
Concentrates	438·00	23·65	
Tailings	438·00	23·65	
Ore	47·92	2·70	
Manganese	625·25	33·80	
Silver-bearing material		1549·17	83·80
Limestone	33·02	1·80	
Slag recharged	260·80	14·40	
Cleanings recharged	6·00		
Fluxes		299·82	16·20
			100·00
Colorado coke	168·17		
English coke	81·00		
Charcoal	67·84	317·01	17·15
Total materials	2166·00 tons.		

Production, 2708 bars; 144·88 tons, containing

	Silver, ounces.	Gold, ounces.	Lead, pounds.
In bullion shipped, 131·95 tons	40,883·57	298·81	263,333
In bullion on hand, 12·93 tons	4,654·80	34·00	25,537
	44,538·37	332·81	288,870
Market value of bullion shipped	$44,170.28	$6,013.22	$9,068.52
Total value			$59,251.92
Freight and charges			4,189.61
Net return			$55,062.31

The value of this product is as follows, the return from the bullion on hand being estimated:

Returns from 131·95 tons shipped net	$55,062.31
12·93 on hand	6,000.00
Returns from 93 tons concentrates amalgamated	5,500.00
Total product from re-working tailings	$66.562.31

The portion of concentrates sent to the mill contained more quartz and less lead than the average product. They milled to about 65 per cent of their value, and will be re-concentrated when the Corbin tailing-beds are worked.

In preparing the concentrates for the furnace, they are mixed with about half their weight of fine slimes from the oldest bed of tailings. It was hoped that the whole of this bed, which is the richest portion of the tailings, could be smelted without concentration, but its poverty in lead prevents this result. The greatest result experienced in operating the furnace was when the attempt was made to utilize the unconcentrated tailings.

Amalgamation of the concentrates will probably not be resorted to again, and the calculations of future operations may be based upon the furnace work alone. Changes that are necessary in treatment, such as using a smaller proportion of unconcentrated tailings, prevent a close reliance upon the results already obtained, but the following figures are very near the truth:

Three thousand eight hundred tons of tailings will be concentrated and smelted for $29,217 or $7.69 per ton, and, together with the fluxes and ores which will be smelted with them, and the cost of which is included in the foregoing calculation, will yield $61,000 or $16.05 per ton; profit, $8.36 per ton of tailings.

This calculation includes the cost of construction, mining, flux, and all accessories, with expenses at a higher rate than they will be in future. It affords a means of estimating the probable value of the tailing-beds, taken in connection with the Lucky Cuss mine, and the estimate seems to be faulty only in one respect. The results obtained from the tailings are not uniform. The sandy portions concentrate best, and so far we have treated a better material than we shall treat again until the Corbin sands are reached. On the other hand, the work will improve with experience and attention, and it is assumed these opposite conditions will balance each other.

The value of the tailing-beds can be reached in two ways. In the above calculation, a profit of $8.36 per ton of tailings is ascertained on the supposition that the proportion of unconcentrated tailings worked with the concentrates will be 1 : 2 in the future instead of 1 : 1 as in the past. This assumption disturbes the result somewhat; but a profit of $8.36 per ton on 72,000 tons is $601,920.

On the other hand, the results actually obtained are these: From 10,417 tons of tailings there were obtained in twelve months 1480 tons of concentrates, or in the proportion 7·08 to 1. Of the concentrates, 438 tons, or 29·6 per cent, were smelted with an equal weight of tailings, so that the quantity of tailings represented in the furnace product is $438 \times 7{\cdot}08 + 438 = 3540$ tons. This yielded $61,000, or $19.61 per ton, at a cost of $29,217.24, or $9.42 per ton, and if the whole pile of tailings could be smelted with equal results, it would yield a *profit* of $668,000. The difference between the two computations shows the influence of silica in the charge, which, by demanding manganese to flux it, increases the profit. On account of the moderate proportion of lead in our charge, we are not able to treat a mixture so siliceous as that given by equal weights of concentrates and tailings, and therefore the first and lower computation is the more trustworthy one. Either calculation exhibits clearly the great value of the tailings owned by this company, a value which is due to the unusually large proportion of lead in its ores as compared with the ores of other mines in this district. The result obtained fully justifies the advice I have given the company upon this question. The whole cost of construction, materials used, and labor in concentrating and smelting (to the end of February, 1883), has been $49,693.71, and the returns $66,562.31, so that all expenses have been paid and a substantial profit earned during an experimental campaign made upon only a small per cent of the tailings available. A year ago, tests were made by milling a small lot of the tailings; but the gross return was only about $1.50 per ton, or say $100,000 for the whole pile. It is worth noticing that, by merely stirring the tailings with water and floating off the fine part, a sandy residue has been obtained forming 0·8 per cent of the whole mass of tailings, and yielding in the mill $5500, as shown above. This amounts to 48 cents per ton of tailings, but it is doubtful whether the same proportion will be maintained when the lower portion of the beds where the slimes are most abundant are reached.

THE WEAR OF IRON RAILS IN BELGIUM.—The *Bulletin* of the French iron-works gives the following table of the rails renewed in Belgium in the twelve years from 1869 to 1880, inclusive:

Years rails were laid.	Years in service.	Percentage that had been renewed in 1880. Iron.	Steel.
1869	12	65·74	0·89
1870	11	84·54	....
1871	10	95·74	....
1872	9	72·41	0·44
1873	8	41·41	....
1874	7	17·44	....
1875	6	26·66	....
1876	5	14·98	....
1877	4	4·19	....
1878	3	.....	....
1879	2	0·23	....
1880	1	.....	....

The most striking thing in this, says the *Railroad Gazette*, is the long life of the iron rails. That one third of the rails laid in 1869 should be in service twelve years later on roads with so active a traffic as that of Belgium indicates an unusually good quality of iron. It is true that of the rails laid in each of the three next years a large proportion has failed, though they have been in track a shorter time. The steel rails can hardly be said to have worn out at all—less than 1 per cent of those in track twelve years and less than ½ per cent of those laid nine years, and none of those in track a shorter time. The number of each kind laid is not given, but iron was largely used in Belgium until quite recently, and most of the tracks there must still be of iron.

THE SILVER KING MINE.*

By Prof. William P. Blake.

(*Concluded from page* 256.)

Mineralogy.—The mine is prolific of minerals and silver specimens of great beauty, highly interesting to mineralogists and collectors. There is, as usual, a great contrast between the surface ores and the ores from the lower levels. The surface ores are partially oxidized and decomposed, and are more earthy and less metallic in appearance than the ores from below. The rock inclosing them is also changed to a rusty brown color. The surface ores were, however, brilliant in the coloring, generally presenting masses of malachite-green and of azure blue, due to the carbonate of copper, with small sheets and filaments of snow-white pure silver in beautiful contrast. Here, also, were the nuggets, generally in irregular nodular forms, with smooth surfaces, and jet-black in color. Pyrites was rarely found. But when the mine was opened below the open cut, the true mineralization of the mass was found to consist, generally, of sulphides—the sulphides of silver, of lead, of zinc, and of copper, disseminated, together with native silver, in the quartz veinlets through the rock.

The following list comprises the principal mineral species which I have found occurring in the mine: Native silver, stromeyerite, argentite, sphalerite, galenite, tetrahedrite, bornite, chalcopyrite, pyrite, quartz, calcite, siderite, barite. Near the surface, in the decomposed parts of the vein, where the ores are partially oxidized and desulphurized, we find in addition horn-silver (cerargyrite), malachite, azurite, native copper, cuprite, besides oxides and carbonates of lead, and possibly embolite, the chloro-bromide of silver; also the argentite, in pure black lumps.

Development.—The mine is now opened to a vertical depth of 830 feet below the initial point of the cross at the summit of the open cut. This includes the open cut and the sump 36 feet deep. The summit is about 80 feet above the level of the mouth of the main engine-shaft. The shaft, exclusive of the open cut and the sump, is thus 714 feet deep. This shaft is vertical and is well and thoroughly timbered in the best manner from the top to the bottom. There are two compartments, each four feet in the clear, and fitted with guides and cages. It is in perfect order, as shown by the smoothness with which the cages run. There is not sufficient water to require a pump; what there is comes from the 114-foot level, and does not exceed 2000 gallons a day. It is hoisted by a tank fitted to the cage. A large sump reservoir at the seventh level serves to hold it while accumulating.

There are seven main levels, as follows:

Number.	Depth from surface.
I.	114·6
II.	256·0
III.	354·9
IV.	408·0
V.	570·0
VI.	612·0
VII.	714·0

An intermediate level, between II. and III., is at a depth of 302·9 feet below the surface.

Level I. passes throught 80 feet of quartz and extends some 30 feet into the country-rock, or ore-bearing rock, beyond it. It has not been cross-cut, and can not be considered to be a full test of that level of the mine. At the time it was run, the distribution and the position of the ore were not as well understood as they now are.

Level II., 256 feet, passes through about 75 feet of quartz, and shows very rich silver ore in detached bunches throughout its mass.

The next level below, the 302·9 feet, or intermediate level, follows the lower side of the quartz for 30 feet, and has a cross-cut extending at right angles for 50 feet, all in quartz. The underlying ore-ground back of the quartz has not been explored.

Level III., 354·9 feet, extends on both sides of the shaft, and has been driven around the quartz chimney so that the two levels started in opposite directions are now connected. This level penetrated a large body of fine ore of high grade, rich in silver, underlying the quartz, upon which considerable stoping has since been done but without reaching, as yet, any definite limits of the ore. The size of the floor is approximately 63 by 43 feet, or 2700 square feet.

Each floor in succession upward, to the 303-foot level, is smaller in area than the one below it. There are seven such floors or stopes from the sill-floor, on the third level, to the upper one just under the 303-foot level. This opening upward is one of the largest stopes of the mine, and represents an excavation in the aggregate of 97,921 cubic feet, which, taking 10 cubic feet to a ton, would represent about 9792 tons. I found the specific gravity of a sample of dark porphyry with some ore in it to be about 3, which would require about 10·7 cubic feet to weigh a ton. A considerable part of the rock-ore taken out should be estimated at from 11 to 12 cubic feet to the ton. This stope has been one of the best of the mine. Large quantities of silver sulphides were turned out of these floors and were rich enough to be sorted out by hand and shipped directly without being passed through the mill. The assays of ores from this stope were very high, and for the roasted ore were from $250 to $400 per ton for months in succession. For the present, the work on these floors is not prosecuted. They remain as they were a year ago. It is believed that the stopes may be considerably extended on the sides, so as to extract a large additional quantity of ore from each of the floors.

Level IV. Stoping has been extended on this level up to the 356 and above to the 300-foot level. A body of quartz, about 8 feet thick, is cut in the extreme northwest corner. The area of this sill-floor is 2557 square feet, and the cubic measurement of the stopes above it to the third level is 133,788 feet, representing an extraction of 13,378 tons, as nearly as can be calculated by measuring each floor. A portion of the excavated space for one and a half sets up is filled in with rock waste, to aid in supporting the ground above. This work is now in progress. The waste is hoisted from the fifth and the seventh, instead of being sent to the surface. It is carefully piled between the timbers, so that mining can be extended at will beyond the limits of the present excavations.

Level V. This level is but partially opened. It looks remarkably well, showing an abundance of ore on the north and northwest sides of the sill-floor. The porphyry is very dark-colored on the western side, and appears to contain chlorite. Amethystine quartz and galena ore are abundant.

The area of this excavation is approximately 3348 square feet. There are no stopes above; the ground is all standing up to the fourth. The cubic measurement of the ore extracted is 28,457 feet, and the tonnage may be placed at 2845 tons. Two winzes connect this level with those above and below for the purpose of ventilation. One extends down to the sixth and the other up to the fourth. The other levels are similarly connected.

Level VI. This consists of a mere drift, extended 82 feet from the shaft on the northwest side, to connect with a winze from the seventh level. It is also connected by winze with the fifth level above. No stoping has been done here, but the ground is ready to be opened out when required. The cubic measurement of the ground removed is, as estimated by calculation of the dimensions of the drift at 3150 feet, equivalent to 315 tons. The direction of this drift is the same as that of the seventh level, directly under it.

Level VII., 714 feet. This is the lowest level in the mine, and it is also the largest. It extends northwest from the shaft, and is ore-bearing from the shaft to the extreme face. The limits of the ore are not yet ascertained. The faces around the excavation of the sill-floor are still in ore, and are showing finely, especially at the bottom. The floor of the whole level is said by the miners who worked it to be very rich. It is the most brilliant level of the mine, and gives great promise for the extent and value of the ground below and above it. The distance between the posts is six feet from center to center, and the total area of the floor as now excavated is 5904 square feet. Stoping has been carried upward three floors higher, or 32 feet above the sill-floor. The aggregate extraction from this level and the connected floors above, including the winze to the sixth, is 166,228 cubic feet, or about 16,623 tons.

The aggregate extraction from the mine below the open cut, or rather from the 304-foot level to the seventh, inclusive, may be summed up as follows, the extraction from each level and the stopes above it being recapitulated from the foregoing descriptions:

AGGREGATE OF EXTRACTION FROM THE LEVELS BELOW THE 300.

Levels.		Cubic feet.	Tons.
Number.	Number of feet deep.		
III.	354–303	97,921	9,792
IV.	408–354	133,788	13,378
V.	510	28,458	2,846
VI.	612	3,150	315
VII.	714	166,228	16,623
		429,545	42,955

In calculating the number of tons, 10 cubic feet have been allowed to the ton. The pure dark porphyry, without ore, is found by experiment to have the specific gravity of 2·68, or 12 cubic feet to the ton.

The sump, 36 feet lower than the sill-floor of the seventh, is reported to be in ore, thus proving the continuous existence of ore from the surface to the lowest point yet opened in the mine.

The strength of the ore-ground in the lowest level is very encouraging for the future of the mine below, and it indicates, also, that the upper levels may be more extensively opened to advantage. So far, there is nothing to indicate any giving-out of the ore in depth. The changes of grade of ore from level to level are as likely to be in favor of higher grades of ore as of lower grades.

Production of the Mine.—The records, if any exist, of the earliest workings of the mine before its incorporation, are very imperfect. It is therefore difficult to ascertain with precision the aggregate production. Much ore is known to have been taken out and sold before the incorporation of the Silver King Company. It is believed that the value of the ores so sold is not less than $1,000,000.

The production since the incorporation up to the end of 1881 (January 1st, 1882), was $1,973,458.68 gross, in value. It was estimated by the general manager that 19,200 tons had been reduced and concentrated up to the 31st of December, 1879. The sale of ore for the same period amounted to $819,141.58.

The exceptionally rich character of the Silver King ore is best shown by the records of the shipments and sales, and by the assays of average samples. It varies of course in different parts of the mine. Some of the levels yield richer ore than others, as, for example, the third and the fourth, where an unusual amount of rich sulphide of silver was found. Before the construction of the railroad from San Francisco to Arizona, at Fort Yuma, access to the mine and transportation to and from it were not only tedious but very expensive. The development of the mine was therefore not only retarded but it was impracticable to work ores of a grade that ordinarily would pay a handsome profit. During that period of isolation and inaccessibility, the shipments were of necessity restricted to hand-sorted ore of high value, carefully selected, and averaging $1000 per ton, being such ores as would bear the great cost of extraction and transportation. All these extraordinary expenses have been gradually reduced, and since the completion of the railroad through the territory it has become practicable to ship ores of ordinary average grade with advantage. Much of the lower-grade ore, which for a time was laid aside, has since been sorted over and concentrated.

It is now found most profitable to crush and concentrate the ore and to ship the concentrates for sale to reduction-works. Considerable quantities have been sent to Castle Dome Mining and Smelting Company at Melrose, California, to the Selby Works, and to the Omaha Smelting-Works.

The mill of the company is at Pinal, five miles from the mine, and 20 stamps are kept constantly running. The amount crushed per day ranges from 50 to 57 tons. In the month of November last, 1532 tons were crushed, being an average of a little over 51 tons a day. The stamped ore, wet, flows to eight Frue concentrators, which are made to "handle" the entire product. For the same month of November, the total product of concentrates was 78·944 tons, being 5·2 per cent of the amount of ore

*Abstracts from a work entitled *Description of the Silver King Mine of Arizona.* New Haven, March, 1883. 48 pages.

stamped; the tailings, by difference, amounting to tons 1453·056, or 94·8 per cent. These tailings contained, by assay, $4.95 per ton in value of silver, and the concentrates, by assay, contained $1094.15 in value per ton in silver, being a total value of $86,377.01, which, deducted from the gross valuation, by assay, of $93,574.56, shows a loss of $7197.55 in value, or 7·69 per cent.

The battery samples for the period averaged $61.08 in value.

There is unusual difficulty in the way of obtaining closely correct samples of the concentrates, owing to the amount of native silver they contain. Samples taken from the same lot, and in the same way, will often give very different results. Great care has to be exercised to take every particle of the bottom layer of dust next to the rubber cloth upon which the powder is mixed.

These concentrates are dried and sacked for shipment in strong canvas sacks. The average content in lead, as determined from many shipments, is 21½ per cent, and of zinc 18 per cent. The chief value is in the native silver disseminated in the stamped mass in the form of irregularly shaped scale-like fragments.

At the time of my first visit to the mine, in the spring of the year 1880, desiring to check the statements of the value of the ore-bearing rock by assays entirely under my own control, I took four samples, as follows:

I. On 356-foot level. Along drift for 10 feet, corresponding to the part sent to mill.

II. On 356-foot level. Face of drift for 10 feet.

III. On 304-foot level. Quartz and "Horse-flesh" copper ore with some "yellow copper."

IV. On 256-foot level (second). Large pieces of quartz, with some gray copper and yellow copper.

I took these samples to Messrs. Huhn & Luckhardt, of San Francisco, for careful assay, and received the following returns, as per the original certificate, a copy of which is subjoined:

RESULTS OF ASSAYS.

SAN FRANCISCO, May 15, 1880.

SAMPLE NO. 9876—Marked "No. I." Silver King. One parcel of ore. The whole was crushed and pulverized, and an average sample proved to contain—Gold, none; silver, 114·23 ounces = $147.69 per ton (2000 pounds).

SAMPLE NO. 9877—Marked "No. II." Silver King. Small sack of ore. The whole was crushed and pulverized, and an average sample proved to contain—Gold, none; silver, 243·05 ounces = $314.24 per ton (2000 pounds).

SAMPLE NO. 9878—Marked "No. III." Silver King. Small sack of ore. After being crushed and pulverized, an average sample proved to contain—Gold, none; silver, 77·99 ounces = $102.13 per ton (2000 pounds).

SAMPLE NO. 9879—Marked "No. IV." Silver King. Small sack of ore. The whole was crushed and pulverized, and an average sample proved to contain—Gold, none; silver, 14·58 ounces = $18.85 per ton (2000 pounds).

The seventh level yields beautiful masses of native silver, associated with stromeyerite and blende. Specimens have been sent forward since my last visit in December, and are equal to any seen in the upper levels. The area of the excavation has been extended, and full details are given in the Annual Report of the Superintendent, dated January 1st, 1883.

Since then, some important additions have been made to the facilities for crushing and delivering ore to the mill, and to the plant for concentrating.

A large crushing-mill has been erected at the mine, where the ore is passed through a large-sized Blake rock-breaker, and is stored in bins with chutes and gates, so that it is loaded directly into the wagons to be taken to the mill at Pinal.

The batteries have been changed so as to deliver from both sides, and four additional Frue tables will be set up. It is expected that with these improvements the daily product can be increased to seventy-five tons of concentrates.

IRON-MAKING IN NEW ZEALAND.

For many years past, the deposits of iron-sand on certain parts of the shores of New Zealand have been well known, and have been the object of much solicitude on the part of the New Zealand government, as well as of those who have endeavored to use the raw material to commercial advantage. It was urged, says the *Ironmonger*, that the absence of suitable fuel within reasonable distance of the deposits would always be an insuperable obstacle in the way of using up the sand on the spot; yet that obstacle, serious as it seemed, would appear to have been overcome, judging from information just at hand. As is well known, there are immense deposits of the iron-sand along the West Coast of the North Island, and these have been the scene of many costly efforts to produce the iron. The Titanic Steel Company, of New Plymouth, for instance, spent thousands of pounds in vain attempts to reach the goal it had in view, and other speculators also failed to reduce the sand into the iron of commerce. While these experiments were going on in New Zealand, however, a New Jersey man named Joel Wilson had grappled with and conquered the difficulty. He patented his invention, and it is now in use in several parts of the United States. It is by means of his process that the iron-sand of New Zealand has at length been successfully dealt with. The enterprise has been carried out by Mr. John Chambers, one of the managing directors of T. & S. Morrin (Limited), Auckland, in conjunction with Mr. Gardner, of New York. They have selected a site at Onehunga, Manukau Harbor, where there are millions of tons of iron-sand on the foreshore. A furnace has been erected under the superintendence of Mr. Jones, formerly of the Rockaway Iron-Works, New Jersey. According to the New Zealand *Herald*, the plant on the ground at present consists of a furnace 32 feet in hight and 7 feet diameter; a reverberatory puddling-furnace with the deoxidizer over it, in which the sand is deoxidized by the waste heat from the puddling-furnace; and a magnetic separator. The iron-sand is brought by sea from the Manukau Heads, and is in the first instance taken to the separating-shed, where, by the aid of magnets, the iron is separated from the other foreign matter, and they fall into separate chutes. The iron-sand contains from 70 to 75 per cent of pure iron after the separating process; but it is estimated that 5 per cent is still left in the refuse, which is partly beach sand, with a small percentage of titanium. The iron-sand, thus cleansed, is then hoisted to the top of the furnace, into which it is introduced by a number of small openings into a series of retorts, where it is subjected to a reducing process. Upon opening a valve, any required quantity of red-hot sand is run into the puddling-furnace, where the carbon is burnt out of it, after which the iron is treated as in an ordinary puddling-furnace, blooms being taken from the furnace and finished. It is stated that the yield from the sand is greater than from pig-iron, as regards puddling, twenty blooms of 1¼ cwt. each being produced daily by a furnace of the size just mentioned. Greymouth coal was used at the preliminary trials, but it is stated that Waikato coal will answer well enough for all practical purposes. According to one of the principals, the cost is set down as under: Pig-iron for iron-making was worth in England from 45s. to 80s. (say 60s.) for good quality per ton. Against this they placed 1¼ tons of iron-sand, at 10s., making 15s.; charcoal, 20s.; making 35s. for charcoal iron, or 25s. for ordinary iron made with coal. It was not proposed to use any thing but slack coal, which could be placed here for 10s.; and as the right to use Wilson's patent gas-producers had been secured, Waikato slack would answer every purpose for these works. The quantity of imported bar iron last year was 8122 tons; hoop-iron, 757 tons; sheet-iron, 543 tons; plate-iron, 705 tons; fencing wire, 9215 tons; total, 21,928 tons. It was proposed at present to manufacture only bar-iron and wire, but the manufacture of hoop, sheet, and plate-iron would no doubt come in time.

FURNACE, MILL, AND FACTORY.

The Bennington (Vt.) Machine-Works are now building gunpowder machinery for the American Powder Company, Boston, and for the Pennsylvania Powder Company. Besides this, they have just shipped to the Miami Powder Company, of Xenia, Ohio, a large drying apparatus, capable of drying 25,000 pounds of saltpeter per day. The machine is furnished with Colonel Scott's automatic devices for handling the material.

T. C. Snyder & Co., of Canton, Ohio, have recently made a shipment of their roofing, packed in bundles, so as to be readily transferred from the railroad on pack-mules to the mine.

Jefferson furnace, located in Schuylkill County, Pa., a short distance above Auburn, which had been idle since December, was blown in few days ago. It is a charcoal plant, and is owned and operated by J. M. and H. Y. Kauffman.

Charles F. Elmes, of Chicago, is building another batch of hydraulic pumps and Harrison coal mining machines.

The Link Belt Machinery Company, of Chicago, is building a coal elevator for the Soddy Coal Company, of Chattanooga, Tenn.

The Cummer Engine Company, of Cleveland, will soon break ground for the new additions to its works, which additions will comprise new boiler and pattern-shops. Rodee & Bill, Ogdensburg, N. Y., have ordered this week of the above firm a 200 horse-power engine, with boilers, independent condenser, and complete outfit. Hill, Clark & Co., the Boston agents of the Cummer Engine Company, have also this week sent in orders for two of the Cummer automatic engines, to be placed in the last-named city.

The Lebanon Iron Company, located on the grounds of the old pipe-mill, at Lebanon, Pa., started up on Tuesday last. Four furnaces were started at first. The mill will turn out muck iron, to be used in the nut and bolt-works.

The Gates Iron-Works, of Chicago, have just shipped to Topeka, Kansas, one of their largest-sized rock-crushers, for ballasting the Atchison, Topeka & Santa Fé Railroad.

The French Spiral Spring Company is getting ready for an open-hearth steel plant.

It is announced that the North Chicago Rolling-Mills, which have been idle for the past six months, and furnish employment to 2000 men, will resume work early next week.

Citizens of Mercer, after raising $10,000 to secure the Union Tube-Works, of New Castle, were informed by the proprietor that he had concluded not to move.

The Gaylord Rolling-Mill and Steel-Works, having received offers of large donations from other cities to move there, are considering the same, and the chances are, that Portsmouth, O., may lose them unless liberal inducements are offered by the citizens to retain them there. Steps are taking toward this end.

The Oregon Iron and Steel Company, recently incorporated, is to erect mills at Portland, Or. Capital stock, $3,000,000. The plant has been purchased, and it is expected that the mills, furnaces, etc., will give employment to 2000 men.

The large and valuable property formerly owned and occupied by the Revere Copper Company has been sold to a couple of enterprising capitalists for improvement. It comprises more than forty acres, and constitutes nearly the whole of the peninsula known as Point Shirley, in the town of Winthrop, Mass., the exception being a few acres within whose boundaries stands Taft's Hotel. The total water frontage of the purchase is 6000 feet, 2500 feet of which is a capital sand beach, while the inner land forms a long hill, which affords an extended view inland as well as to the sea. It is accessible by the Boston, Winthrop & Point Shirley Narrow-Gauge Railroad. The Revere Copper Company occupied the premises from 1844 to 1870, at the latter date centering its interests in Canton, the present location of the mills.

Messrs. Fraser & Chalmers, of Chicago, report that they have the following orders on hand: One 75 horse-power engine, with boilers, shafting, pulleys, etc., complete for driving two 40-light dynamo machines for lighting the city of Albuquerque, N. M., by the Albuquerque Electric Light Company; and the following smelting plant: One 36 by 60 wrought-iron water-jacket furnace, with No. 5 Baker blower, slag-pots and all fixtures, and a 40 horse-power engine and boiler for the Republic Mining Company of Bozeman, Montana; a 36 by 84 and a 42-inch wrought-iron water-jacket smelting furnace, with No. 6 Baker blower, for the Benson Mining and Smelting Company, of Benson, Arizona; and a 36 by 48 water-jacket furnace for the Aurora Smelting and Refining Company, of Aurora, Ill. They are building a 30-stamp gold mill, with engine, boilers, etc., for the Santa Cruz mine, Honduras; a 20-stamp mill, with Corliss engine and boilers, to go to Venezuela; a 20-stamp gold mill, with engine, boiler, and Frue vanners, for the Golden Rule mine, Dragoon, Arizona; and a 5-stamp mill, with Frue vanners, for the Ropes Gold and Silver Mining Company, of Ishpeming, Mich. Two Frue vanners each have been ordered by the Argyle Mining Company, of Winnipeg, Manitoba; the Little Annie Gold Mining Company, of Summit, Colo.; Mr. M. V. B. Gillette, of Boulder, Colo.; and the Terrible mine, Silver Plume, Colo.; and one Frue vanner by the Iowa & Colorado Mining Company, of Summit, Colo. A complete hoisting and pumping plant has been bought by the Corralitos Mining Company, of Mexico. In addition to these, Messrs. Fraser & Chalmers are building a six-foot Murphy Champion ventilator for the Osage Coal and Mining Company, of Missouri, and for the Mining Association, of Halifax, Nova Scotia, and a four-foot Champion ventilator for the Coal Run Coal Company, of Streator, Ill.

Mr. George Miles has moved from his old boiler-works, on Granite street, South Boston, where the firm has carried on business for nineteen years, to his new building on A street. He has purchased new tools and machinery, and in a few months' time will have facilities for a large business.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY.

COPPER QUEEN.—The product of this company from January 1st, 1883, to April 30th, is officially reported at 2,835,799 pounds of copper. The superintendent reports, May 1st: Production last month (768,097 pounds of copper) is a few tons greater than we have hitherto produced in any one month. During the past week, the ground in incline has become softer, and our progress has been six feet. Depth now below 300 level is forty-three feet. We are not bothered with much water at bottom of incline; the tank just below the sill-floor of 300 level catches the greater portion. You will notice from monthly statement that more than one half of the ore mined last month came from the stopes of 300 level. These stopes continue to look very fine.

PEABODY.—One of the smelters has started up and the other is expected to be ready to start up on the 15th.

TOMBSTONE DISTRICT.

CONTENTION.—A dispatch says that the superintendent has gone to San Francisco, to purchase pumps for use in the mines to aid the Grand Central in controlling the water. A twenty-foot ledge of ore at the water-level in the Contention assays higher than any other ever taken out of the mine.

WORONOCO.—Considerable work has been done on the San Diego mine, the main shaft being down 475 feet, while numerous drifts and cross-cuts on various levels have exposed large bodies of good ore, the average of which may be safely stated to be 75 ounces per ton, silver, with 20 per cent lead. La Grande claim, which the company has bonded, lies north of the San Diego, and has a shaft down 100 feet, with drifts running to the north and south, 20 feet each way. The ore assays 20 per cent lead, with results in silver running from 20 to 60 ounces per ton. A thirty-ton water-jacket smelter, which was successfully completed a few days ago, has been started up.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended April 28th shows: Tons of ore crushed, 163·62; average assay value of pulp, $31.04 per ton; of tailings, $4.17. North drift, 1000 level, is now 70 feet long. North drift, 800 level, is 404 feet long. North drift, 672 level, is in 113 feet. Work was resumed in the south drift from winze No. 6 at the 640 level; the drift is now 134 feet long. On the 21st, a winze on the rich seam was begun from the north drift at the 780 level. This winze is to be known as No. 5; was sunk four feet during the week.

STANDARD CONSOLIDATED.—The official report for the week ended April 28th shows: Ore extracted and shipped to mills, 686 tons; bullion shipped, $29,720.10. East cross-cut, 1000 level, is in 1348 feet. Uprise from south drift, 700 level, is up 42 feet, and shows 3 feet of vein. West cross-cut from north drift is 200 feet long, and is still in hard ground. North drift No. 1, 500 level, is in 663 feet, and shows 10 feet of vein. The winze from north drift is 88 feet long; vein 10 feet wide. North uprise is 100 feet high. South uprise No. 1 is up 200 feet. West cross-cut No. 1 is 412 feet long. South drift No. 2, 885 level, is in 494 feet, and shows 5 feet of vein. Uprise from this drift is up 176 feet, where the vein is 5 feet wide. Uprise No. 5 is up 115 feet, and north uprise is up 98 feet. North drift No. 3 is in 95 feet. The stopes are looking well.

CANADA.

PROVINCE OF NEW BRUNSWICK.

QUEEN MANGANESE MINES.—A cargo of 105 tons has been shipped to Liverpool. New crushing machinery is going up.

COLORADO.

CHAFFEE COUNTY.

It is stated that not far from Calumet, in Cree camp, and on Monarch Mountain, are immense ledges of white and variegated marble, that are attracting much attention. The marble runs nearly 100 per cent pure carbonate of lime, and is pronounced by experts of a No. 1 quality.

Reports from different mines in Monarch District show that the Columbus, at Columbus City, is working forty men in the mine, and the mill of twenty stamps is running night and day. Six companies have been doing development-work all winter on Middle Fork, and several of them have cut their leads and have large ore-bodies in sight. On Monarch Mountain, work is steadily going on. The Monarch and Fairplay are shipping ore steadily. Only a few men are at work now at the Madonna mine, but early in the season a large force will be put on and the ore will be shipped to Pueblo. The Eclipse has large ore-reserves in sight. The Silent Friend is 65 feet in solid ore. The North Fork Consolidated Mining and Smelting Company will resume work early in the season. Its tunnel is now over 1300 feet.

CLEAR CREEK COUNTY.

LITTLE MATTIE.—In the lowest level, a fine body of ore measuring about two feet in width, of a fine average, was struck near the shaft. At a short distance farther on, what appeared to be the hanging-wall was blasted away, and a streak was found constituting what seemed to be the wall. This contains an unusual amount of gray and yellow copper.

PAY ROCK.—The machinery was started May 5th for a test of its working.

SEVEN-THIRTY.—The ore mined last month netted about $8000 over mill charges. A mill-run has been had on ore from the 80-foot level east as follows: First-class, 192 ounces of silver, 30 per cent lead per ton; second-class, 120 ounces silver, 27 per cent lead. From forty to fifty men are constantly employed.

DOLORES COUNTY.

A larger amount of steady development-work is going on in the vicinity than at any previous period, while large sums of money are waiting the advent of good weather to begin operations in many mines owned by companies. The Rico Pasadena Mining Company, of Rico, is well supplied with capital and is ready for active operations. At the Dolores Valley Mining Company, work will be commenced on its many properties.

There are three smelters and reduction-works in operation, and the Rico smelter is expected to fire up soon.

PIGEON.—While running a cross-cut, a body of ore was recently struck, fully three feet in width, and within the vein, which is enormously wide, that gave 240 ounces in silver and a mill-run of 160 ounces in silver and 26 per cent galena.

SOUTH PARK.—The mine is developed by a 300-foot tunnel. In a cross-cut hirty feet from the main tunnel, some manganese silver and galena ore was truck which assays high.

FREMONT COUNTY.

The oil-well near Cañon City is now 1400 feet deep. Its capacity is about 10 barrels per day of a very superior lubricating oil. The present bottom of the shaft is still in sandstone, and it is expected that when greater depth has been attained or the sandstone cut through, a well of greater capacity will be developed. The company contemplates sinking another well about three miles north and west of the present one.

GARFIELD COUNTY.

Prof. B. Clark Wheeler, who has recently visited Garfield County, states, according to the Denver *Republican*, that it has vast and easily accessible fields of coal, excelled by none this side of Eastern Pennsylvania, with bodies of iron ore near at hand, together with timber, grazing, and agricultural lands. He feels great confidence in the carbonate section, which is quite extensive, at least ten by twenty-five miles. It is not a mountain range, but an elevated rolling plateau, averaging 10,000 feet above the sea, with all the Carboniferous, Devonian, and other rocks eroded away down to the dolomitic limestones in the Silurian measures, in which the mineral characteristics are of two kinds—one similar to Leadville, the other like portions of Utah lime fissures. Large bodies of mineral exist, low grade at the surface, to be sure; but what little development has been made shows great improvement, yet surface assays frequently run as high as 70 ounces silver and 40 per cent lead.

GILPIN COUNTY.

The coming season, says a correspondent of the Denver *Tribune*, will undoubtedly be one of the most important and interesting in the history of this county. Among the different mines with good prospects near Central City are the Anglo-Celt, with a shaft 118 feet deep. The Tryone lode, with a shaft 80 feet deep; the last ore shipped milled $180 to the ton. The Argo lode has been leased to a Denver company, and will begin operations with as little delay as possible. The mine is said to be of surprising richness. The Harlem lode is in good condition. The pay-streak is well-defined. From the shipments of ore made by the Barnacle and London mines, recently, the discoveries show up well. The Manitoba, in Vermilion District, has struck silver ore between 3 and 4 feet thick in the 105-foot level running west. Near Black Hawk some fine prospects have been discovered. The mines are north of the Gray Copper lode.

LAKE COUNTY.

Reports state that Governor Grant intends to erect a new smelter in Leadville, the location to be but a short distance from the one destroyed by fire.

The latest Leadville exchanges state the following:

CARBONATE.—Considerable work is done in the Little Grant, Shamrock, and Carbonate shafts. The ore carries from 45 to 135 ounces in silver, and from 3 to 13 per cent in lead, and the shipments are averaging about 15 tons per day.

CHRYSOLITE.—The Bulcher shaft is looking exceptionally well at present, a lime contact having been struck upon which there has almost invariably been found mineral.

CLIMAX.—A body of iron ore has been encountered in a drift run from shaft No. 6.

EAGLE'S NEST HILL.—The property of this company is located near Twin Lakes, and consists of seven full claims. The Dutch Kate is developed by a tunnel 160 feet in length. A vein of ore has been tapped which runs from $70 to $540 per ton. Three stamp-mills will be in operation at the lakes this season, and this company, in conjunction with the Falls lode, will probably furnish from ten to twenty tons of ore per day.

IRON.—Work has been resumed on the Mayer shaft in California Gulch.

LITTLE DIAMOND.—A body of chlorides, which is said to be from six to eight feet on the face, has been struck.

LITTLE PITTSBURG.—At the annual meeting of the stockholders, the following trustees were elected: W. H. Barnum, D. S. Draper, William Bond, C. J. Canda, T. E. Canda, and H. A. Kirkham. The old officers were re-elected. The report of the managing director shows the total surplus April 1st, 1883, $76,056.08, of which $53,727.36 is cash. Ore shipped during the year, 10,573 tons; settled for, 10,343 tons; unsettled for April 1st, 379 tons. Cash received for ore during year, $103,054.79. The official report for the month of April shows: Tons of ore shipped, 999 tons, about two thirds of which came from the leased grounds. These leases expired May 1st, and the subject of renewing them is now under consideration. Prospect-work is pushed vigorously, mostly in the north end of the property. The northwest drift from shaft No. 6 has been run 131 feet during the month. Most of the distance has been in iron, with small stringers of galena carrying from 50 to 150 ounces of silver. Some of the iron assays as high as 30 ounces silver. A drift from shaft No. 9, parallel to this, is also pushed rapidly. In other portions of the mine there is no material change.

MIKE & STARR.—The breast of copper ore is eight feet in thickness and has been cross-cut for a distance of nineteen feet. The smelter returns are forty-six ounces silver, two tenths of an ounce of gold, and about 14 per cent copper. The refractory nature of this ore has forced the owners to have it treated in Denver, and an average of fifteen tons per day is now shipped to Eddy, James & Co.'s sampling-works. This body is capped by a stratum of red iron of a carbonate nature, which carries twenty-seven ounces of silver, and will admit of treatment here. The entire mineral body is pitching almost directly south at an angle of ten degrees, and lies between lime walls, about one foot of talc covering the red iron.

PRINTER BOY HILL.—The *Herald* says that of all the hills surrounding Leadville, Printer Boy Hill is now attracting the most attention. The Iowa Gulch side especially presents a scene of activity similar to Fryer Hill during the early days of the camp. Development is pushed with great vigor.

At the Siberia mine, the shaft has attained a depth of 215 feet.

Adjoining the Brian Boru is the Blacktail, which is one of the oldest and best known producing properties on the hill. The tunnel is in a distance of about 200 feet, and shows a breast of ore three feet in thickness. This ore is a lead carbonate and nets between twenty and twenty-five dollars per ton above all expenses. The property is worked under a lease.

Little is done at the Oro Boy's mine at present, owing to a law suit.

At least five leases have been made on the Brian Boru property, and three of these leases are in mineral. The largest and most important strike has been made in the upper lease, adjoining the Nellie S. The shaft is down thirty-one feet. The ore is of at least two varieties, one of which is a gray sand running very high in lead, and the other a hard lead carbonate. All of the ore carries gold. The ore nets about twenty-two dollars per ton over all expenses.

The McClelland lease, south of the upper lease, is worked through a tunnel, which is in a distance of forty feet. A five-foot body of contact, carrying some mineral, has been passed through, and the workings are looking well.

In the lower lease on the old workings of the Brian Boru, some ore is exposed. This ore carries gold, silver, and lead, and although no shipments are made at present, the ore in sight would justify a regular output.

Under the new arrangement, the Cliosophic is known as No. 1 lease of the Altoona Consolidated, which embraces the Altoona, the Minnehaha, and the Cliosophic. A tunnel is now in a distance of about ten feet. A shaft has also been started and mineral uncovered at a distance of twenty feet from the surface. The Altoona is worked under a lease. Work is done on the surface and ore-bins and shaft-houses are in course of construction. The mine is developed by a tunnel 275 feet in length, from which an uprise has been run for a distance of 138 feet. A contact body eighty feet in thickness has been exposed, and there is a fine body of mineral shown in the uprise.

Adjoining the Brian Boru, and within twenty feet of the upper lease, a shaft has been sunk on the Little Fraction, a strip of ground which is only thirty-five feet wide by 130 long. This shaft is now down 75 feet, and has gone through between eight and ten feet of mineral.

The most productive property on the Iowa Gulch side of Printer Boy Hill is the Nellie S. About seventy men are worked in the mine, and the shipments are between 80 and 90 tons per day. This ore nets above all expenses about twenty dollars per ton. The shipments will be increased shortly to over one hundred tons per day. The formation is very irregular, and the ore-body pinches and widens continually.

PARK COUNTY.

BOAZ.—This company is a consolidation of five claims. The property is now worked under a lease on twenty-five per cent royalty. A new strike was reported

Digitized by Google

recently of ore carrying crystallized silver and sulphurets. The mineral before this last strike carried 251½ ounces silver and fourteen per cent lead.

LONDON.—The new twenty-stamp mill and concentrator at London Junction is fast approaching completion.

POOR MAN'S HOPE.—This lode, situated in the carbonate field south of Platte station, is making a good showing. The shaft on this claim is down eighty-five feet, and mineral was struck at thirty feet. The ore runs from twenty-seven to forty-two ounces in silver. Regular shipments will soon be made to Denver.

SAN JUAN.

A mining suit which involves an aggregate of about half a million dollars worth of property in, and dividends from the San Juan Consolidated Mining Company, the Bull Dog Gold Mining Company, and the San Juan Consolidated Gold Mining Company, has been filed in the United States Circuit Court, at Denver. The complaint is filed by Charles F. Gillett, of Chicago, and the defendants named in the complaint are the mining companies mentioned above and Thomas M. Bowen and Charles W. Tankersley.

DAKOTA.

BLACK HILLS PLACER MINING COMPANY.—The company owns some valuable claims, and there is every indication of activity about the works. Men are now at work putting in order the bed-rock flume, two miles below Rockerville.

FATHER DE SMET.—The superintendent writes, under date of April 19th, as follows: Herewith express company's receipt for bar No. 157, 701·42 ounces gold, the result of run of mill for the first half of April. This is a pretty light bar; but I promise a larger one for the last half of the month. The body of ore on the third level is improving in size and quality as work progresses. On the second level west cross-cut from Cook's chamber, we have a fine body of ore, sampling an average of $8 per ton; it is quite hard, but it will prove of much real value, as the body must be quite extensive. On 15th inst., I drew for $22,000, expenses for March.

HAMMOND.—The five-stamp mill, five miles below Galena, has been purchased by the St. Elmo, and will immediately be removed to that location. A sufficient stream of water runs in close proximity to the St. Elmo to supply motive power to the mill.

HARNEY HYDRAULIC MINING COMPANY.—This company has leased for the season the ground known as the Mitchell Bar, together with flumes, water rights, etc. The lessee is to have from the product $4 a day to the man; the remainder to go to the company. No work will be done directly by the latter this season. A contract will, however, shortly be awarded for running a drain ditch 2500 feet long, beginning below Harney. The gulch has been thoroughly prospected, and the presence of gold in large quantities established.

IRON CITY.—This company is successfully operating the old Lexington ten-stamp mill and the Foote mine. The latter under a five-year lease.

ORO CACHE.—One tunnel is now in 280 feet and another 300 feet, with 60 feet of cross-cuts, all in ore of average value, $7.50. It is probable that a mill will be erected at an early day.

IDAHO.

FLORIDA MOUNTAIN MINES.—Work is doing on a number of mines with satisfactory results. At the Empire State, a good quality of quartz is taken from the ledge, which holds its average width. As soon as the weather will permit, ore will be hauled to the mill, and a larger force of men put on the mine.

Work at the Leviathan is progressing, and good quartz is extracted as the drift is pushed into the hill. The ledge is of good size, and is easily worked.

WAR EAGLE MOUNTAIN.—There is nothing of importance to report from the different mines. The work of development continues, and the product of some of the mines shows a fine quality of ore.

MAINE.

Our correspondent "Dirigo" writes us as follows from Blue Hill, under date of May 7th:

DOUGLASS.—The large cupola furnace, four feet by ten feet, at the Douglass, has been running nearly three weeks, smelting about 20 tons per day. One reverberatory is just now in use as a calcination furnace, but the other is treating the matte from the cupola. The refining furnace is completed and ready for use. Every available team is now at work hauling coal and coke from the wharf to the mine, and every thing about the premises looks lively and prosperous.

STEWART.—The underground work is progressing without interruption. It is proposed to put on sufficient force to run the drifts and levels in the shortest possible time, so that the mine may be having a regular output and established value before putting in any concentrating-works. The difficult and annoying portions of the work of opening the mine are well-nigh passed.

SULLIVAN.—The force of miners is increased.

MEXICO.

Two rich lodes of gold have been denounced in the State of Oaxaca.

Five hundred petroleum claims have already been staked in the State of Vera Cruz. The last four were discovered in the vicinity of Ozuluama and Tantoyuca.

Considerable interest prevails over the recent discoveries of rich lodes of silver and cinnabar in the State of Puebla.

The legislature of Zacatecas has granted *amparo* of one year to the following mining properties: Ave Maria mine, of the district of Pico de Teira; San José y Concordia; and the mines of William Patterson.

HIDALGO.

The stockholders of Santa Gertrudis, at a recent meeting, by a majority vote censured the directors for mismanagement. Although the mine was never in better condition, internal discord has a marked influence upon the stock.

Work on the Encino mine has been discontinued for a period of three months.

Telephone communication has been established between the mines of El Cristo, San Cayetano el Bordo, and the reduction-works of La Purisma Chica, Pachuca.

Work is pushed with favorable results in Californias, Real del Monte. The mines of Santa Rosa District are looking well. Cueva Santa continues to yield, although work is not pushed at present.

Dr. J. A. Skilton, who for years has possessed extended mining interests at and about Pachuca, is preparing the way for the establishment of a cosmopolitan mining journal, to be published at Mexico City. Mr. Skilton, from a personal knowledge of Mexico and her mineral resources, is equal to the demand of such an enterprise, and doubtless will meet with the co-operation of American merchants and friends of Mexico as well as the press of both countries. Frank A. Skilton, of Jacksonville, New York, represents his interests in the United States.

MICHIGAN.

The product of the following mines for April was: Calumet & Hecla, 1642 tons 505 pounds; Quincy, 250 tons 310 pounds; Franklin, 170 tons 1505 pounds; Atlantic, 152 tons 794 pounds; Pewabic, 70 tons 370 pounds.

BELT.—A large mass of copper has been struck in the shaft of the Knowlton vein, the extent of which is not yet known. The Butler vein is producing good stamp rock.

NEW BARNUM.—The mine is shipping ore.

ROPES.—The five-stamp mill to be erected at this mine has been purchased from Messrs. Fraser & Chalmers. The water for the mill will be pumped from the adjoining creek, which is of a size large enough to operate a mill of fifty stamps.

MONTANA.

LEWIS & CLARKE COUNTY.

BOSTON & MONTANA.—According to the Helena *Independent*, some successful experiments have been made recently, at the Gloster mine, with results that reach as high a saving as ninety-two per cent of the gold in the ore and fifty-six per cent of the silver. Considering the magnitude of the mine and the importance of the works, this success is worthy of note. While the gold in the Gloster does not decrease, the silver seems to increase, and the great difficulty has been to save it on the plate of the battery; but this question seems to be solved, and it only remains to put the requisite pans into the mills, when the product from the stamps will be more than double the present output.

CONSOLIDATED GREGORY.—The blast-furnace will start up shortly, and run out about 300,000 pounds of base bullion. Another run will be made about the first of June, when about 200,000 pounds more will be added. The quantity already made and on hand amounts to 434,000 pounds, which makes nearly one million pounds of base bullion that will be ready for shipment when the Northern Pacific Railroad reaches Helena. The works will be improved somewhat after the close of the run to be made in June. The concentrator is to be reconstructed and enlarged to such an extent as to enable it to produce enough concentrations to run four reverberatories constantly, and that will result in the production of about six tons of argentiferous lead daily; for it is thought that, with the contemplated improvement, the blast-furnace will be kept running almost continuously. The mine continues to show well, and the output of ore is about sixty tons per day. In making a cross-cut from the fifth level toward the north, from the hanging-wall of the main vein, and about twenty feet outside, four feet of excellent galena were encountered, and it has been found to hold for a distance of 150 feet along the vein and as far as the stoping has been prosecuted, or for nearly forty feet above.

SILVER BOW COUNTY—SUMMIT VALLEY DISTRICT.

ALICE.—The surface strike in the Magna Charta, 500 feet east of the main shaft, promises to prove a bonanza. An open cut 10 feet deep has been run for a length of 50 feet along the vein, and the average width of $75 ore is seven feet. Twenty tons a day are now taken out of the cut, and as a result the battery samples in the mill have been raised to $40.

ANACONDA.—It is stated by the *Inter-Mountain* that the location of the smelter has at last been definitely determined. The smelter will be built on Warm Springs Creek, and the construction of the works will begin as soon as the required building material can be got on the ground. The smelter will begin operations with a capacity of 300 tons per day, and the facilities for reduction will be increased as rapidly as advisable until the productive capacity of the Anaconda mine shall be fully taxed. A town-site located near the proposed works will be surveyed and platted, and post, express, and telegraph offices will be established. During the approaching summer, a branch of the well-known banking house of Hoge, Brownlee & Co. will begin business. The sinking of the Anaconda shaft, which was suspended for some months, has been resumed, and without any further delay it will be sunk to the depth of 1000 feet. It is now something over 600 feet in depth. The main shaft of the St. Lawrence, which is now 300 feet deep, will also be sunk 1000 feet.

BELL.—The smelter continues in successful operation. Only the east furnace is running, and the amount of ore reduced daily averages 25 tons. Enough ore is on hand to supply the furnace until the new workings of the mine shall be opened, after which both furnaces will run full blast, and at least 60 tons of ore will be treated every twenty-four hours. The shaft at the mine is 245 feet deep, and is going down at the rate of five feet a day, a change having occurred in the rock in the bottom which renders the sinking much easier than formerly. About 65 men are now employed. The matte shipments average about ten tons daily, assaying 55 per cent copper and from $70 to $150 in silver per ton.

SILVER BOW.—In the face and shapes of the drifts run from the bottom of the 130-foot shafts in the Mount Moriah, work is actively progressing on a vein of ore varying in width from two to six feet, with an average width of four feet, and assaying between $35 and $40 per ton. The daily output is 15 tons, which is shipped regularly to the Silver Bow mill for reduction.

NEVADA.

MARTIN WHITE.—There is no important change in the appearance of the mine or in the value of the ore extracted. All of the work in the mine is done in the northerly end of the 160 level. The amount of ore put in the dump for the week ended on the 22d was 35 tons, assay value $30.02 per ton.

NAVAJO.—The superintendent reports: Have begun work on the station at the 550 level, making good progress. Drift south, 450 level, has been advanced 14 feet. No material change in the vein-matter. It carries a little good ore at some points along the vein. South drift, east lateral vein, 350 level, extended 15 feet It shows a good, strong vein, and fair indications of ore. The usual quantity and grade of ore have been milled.

YELLOW JACKET.—The water in the mine remains at the same hight. At the Winters shaft, about 140 tons are extracted and shipped daily. The north lateral drift on the Sagebrush level is now within 60 feet of the north line; the old stope is still on the east side of this drift. Work has been resumed in the north drift on the second level. This drift is found to be in very bad condition and expensive to reopen.

PENNSYLVANIA.

The ore-washers in Berks County belonging to the Allentown Iron Company have been stopped. Business has also been suspended at some of the washeries of the Temple Iron Company.

A large vein of iron ore, which has been pronounced very rich by experts, was discovered a few days ago on the farm of Rev. William Hertzler, near Elizabethtown.

Mr. Randolph Brandt, manufacturer of Seldon's packing and general mill, mine, and steamship supplies, has removed to No. 38 Cortlandt street, New York City.

UTAH.

SAMPSON.—The manager telegraphs from Salt Lake City that he has received and sold two cars of ore, netting the company $1600—$62.50 per ton. Two cars received later netted $75 per ton. Roads continue bad. Reports received by mail state that from four to five tons of ore are taken from the Sampson daily, and that the quantity will be increased to fifteen tons as soon as the new shaft is down.

TELEGRAPH.—The Salt Lake *Tribune* says that a very important mining transaction has just been consummated, by which the well-known Telegraph West Extension mine, Bingham, has passed into new hands. Messrs. Knight, Sutton, and Avis, of Brooklyn, New York, have arrived in Salt Lake City for the purpose of receiving the property and making payment in the name of the Brooklyn Mining Company. The amount paid for this valuable property is a private matter, but we understand it is in the neighborhood of $100,000. The property is known as a lead mine, and the body of ore is said to be large. It is provided with fine machinery for operating, and with concentrating-works which have been turning out 600 tons of ore per month, assaying 55 per cent lead and 10 ounces silver per ton.

SILVER REEF.

STORMONT.—Full returns for the month of April just received show gross bullion product for April $19,676.54. Under date of April 28th, the superintendent at Silver Reef estimates about 3000 tons of ore in sight. Assays for the week ended April 28th ran from $18 to $27.33.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, May 11.

The mining market continues very dull, and there is nothing in the transactions this week worthy of mention. The Pipe Line certificates occupy all the attention of the brokers, and mining stocks are almost entirely neglected. Of the stocks dealt in, Robinson and Sonora hold the lead, while some of the low-priced fancies have been moderately dealt in. A complete summary in detail is given below. The total number of mining shares sold at all the Exchanges aggregates 173,917, as against 240,374 last week.

The Comstock shares have been very quiet at steady prices. California sold to the extent of 2250 shares at 25@23c. Consolidated Virginia was quiet and irregular, selling from 50@55@52c. Sierra Nevada was also irregular, under a small business, and sold from $4.25@$3.60@$3.80. Union Consolidated records a transaction of 100 shares at $3.80. Best & Belcher has been quiet and steady; it sold from $3.55@$4. Sutro Tunnel, with a business of 10,870 shares, sold at 21@20c.

The Leadville stocks were very moderately dealt in and prices were steady. Amie was active and steady, selling to the extent of 12,000 shares at 20c. Chrysolite had a small business at steady prices, selling from $1@$1 05. Leadville sold to-day at 64@60c., and Iron Silver at $2.95. Little Chief sold to the extent of 900 shares at 55@52c. Little Pittsburg was strong under a small business, selling from 58@63c. Climax was moderately dealt in at irregular prices; it sold from 8@10@9c.

The Bodie stocks were quiet and steady. Bodie Consolidated sold at $1.15. Standard records a small business at steady prices, selling at $6.50. Bulwer was moderately dealt in, and was weak; it sold from 70@60c., the sales aggregating 925 shares.

The Tuscarora stocks record but moderate transactions at steady prices. Grand Prize was quiet and steady, selling from 90c.@$1. Argenta sold at $1.05 with one transaction. Belle Isle was quiet, and a little weak, selling from 45@40c. Navajo records a fair business at strong prices; it sold from $2.35@2.45. Independence was quiet and steady, selling from 57@60c. Elko Consolidated sold at 20@21c., assessment paid; the transactions were small, amounting to 5900 shares.

In the miscellaneous list, Alice was quiet and steady, selling at $3.25. Bassick records a small business, and was weak; it sold from $9@$8. Eureka Consolidated was irregular, selling from $5.38@$4.75@$5, under a small business. The Green Mountain stocks were quiet and steady. Green Mountain was strong at 75@83c. Rising Sun sold at 3c., and Cherokee at 4c. Hall-Anderson had a small business, and was weak; it sold from $1.45@$1.25. Homestake declined from $16.25@$15.75, and was strong to-day, closing at $16.25; the business was small. Horn-Silver has been quiet and weak; it sold from $7.75@$6.50@$6.75. Hukill sold to the extent of 450 shares at 11@9c. Northern Belle has been very weak, selling as low as $7.70 to-day from $8.75 on Tuesday; the transactions have been small. Quicksilver, Common, records a fair business at irregular prices; it sold from $8.25 @$7.75@$8. Robinson Consolidated has been active at irregular prices; it sold from 80@92@89c. Sierra Grande was moderately dealt in at irregular prices during the week, but reacted and closed strong to-day; it sold from $1.25@$1@$1.25.

Alta-Montana has been quiet and steady at 4@3c. Bradshaw records a small business at steady prices, selling from 42@40c. Caledonia (B. H.) was quiet and steady at 80c. Decatur had a small business at irregular prices; it sold from 5@3@4c. Durango sold at 5c., the transactions aggregating 6000 shares. Harlem has had a fair business at strong prices; it sold from $1.45@$1.50. Lacrosse was quiet and steady at 11@13@12c. Oriental & Miller was quiet and steady, selling at 14@15c. Sonora Consolidated has been active and weak; it sold from 47@37c., with a business of 26,406 shares. South Pacific was quiet and steady at 6@5c. The State Line stocks were almost forgotten, only Nos. 2 & 3 being dealt in, to the extent of 1500 shares at 5@4c.

The Jocuistita Mining Company has issued the following statement of the business of the company from March, 1882, to March, 1883:

RECEIPTS.

Balance in the hands of treasurer, last annual statement	$440,216.86
Balance in the hands of superintendent Jocuistita, last annual statement	1,503.10
Net proceeds, bullion, 631 bars, Nos. 1075 to 1644 and new Nos. bars 1 to 61	653,494.37
From merchandise, sales in excess of purchases	12,470.94
Current accounts—From superintendent mine and mill	2,175.19
Horse and mule account—Mules sold	386.00
Materials account—Consumed in excess of purchases, Jocuistita	14,554.43
Exchange—Premium on drafts	32,216,09
Total	$1,157,016.98

DISBURSEMENTS.

Mine expense—Jocuistita	$106,987.88
Mill expense, "	85,270.24
Bullion expenses—Export duty, freight from Jocuistita to Mazatlan, etc	71,581.84
General expenses—Jocuistita and Mazatlan	6,719.22
Wood—Purchase in excess of consumption	2,489.11
Ore account—Jocuistita and Mazatlan expenses	82.99
Incidental expenses—San Francisco & N. Y.	1,389.09
Current accounts—Paid account superintendent's salary, S. F.	3,449.50
Office rent, clerk and secretary's salary, N. Y. and S. F	3,300.00
Directors' fees, New York	670 00
Advertising dividends, etc., New York	399.55

Cash in hands superintendent Jocuistita	533.43
Cash in hands of treasurer	384,155.46
Total	$1,157,016.98

MEETINGS.

Dana Mining Company, of Michigan, No. 70 Devonshire street, Boston, Mass. Annual meeting of stockholders and election of trustees, May 21st, at three o'clock P.M.

The Young America Copper Company, No. 39 Broadway, Rooms 16 and 17, New York City. Annual meeting of stockholders and election of trustees, May 24th, at half-past one o'clock P.M.

DIVIDENDS.

The Carbonate Hill Mining Company, of Colorado, has declared a dividend (No. 5) of five cents per share, payable June 1st. Transfer-books close May 19th, and reopen June 2d.

The Jocuistita Mining Company, of Mexico, has declared a quarterly dividend of $50,000, being fifty cents per share, payable at the office of Lounsbery & Haggin, Mills Building, No. 15 Broad street, New York, on May 31st.

The Silver King Mining Company, of Arizona, has declared a dividend of twenty-five cents per share, payable on the 15th inst.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum brokers, No. 49 Broadway, report as follows for the week ended May 11th at half-past twelve P.M.:

One week ago, the market opened at 91¾c., and since that time 95⅛c. has been the highest point reached, which was attained Thursday by a gradually hardening process. The market yesterday afternoon, however, yielded to 92⅞c., on reports of the opening of the Balltown Oil Company's well No. 6, which started off good for about 25 barrels per hour, and the announcement that the Anchor Oil Company's No. 15 was doing better than reported on its opening the evening before. The market this (Friday) morning opened at 93c., and rose to 94⅞c., closing at half-past twelve at 94¾c.

The news this morning is rather bullish in its tendency. It shows the Cooper production from 56 wells to be 4158 barrels. The Glatzau well, lot 324, and Markham, lot 740, both "wild-cats," are reported to be dry, and the market would probably be more buoyant were it not that another important well is expected in to-day. This is the Murphy or Porcupine No. 3, which is 600 feet north of the No. 1 well, which started off at the rate of 800 barrels the first twenty-four hours. This well should be good, and the market might in consequence sell off a trifle; but there is a large short interest which may easily be frightened to cover, thus insuring a good demand for oil on a turn. The statement for April of the United Pipe Line Company is decidedly bullish, as it shows an increase in net stocks of only 11,700 barrels. The company was itself a purchaser of 443,000 barrels of oil during the month for "surplus and sediment account." This adds 25 per cent to its holdings, and would indicate that it does not believe in lower prices. It is a noteworthy fact that it reduced its surplus account last October by about 500,000 barrels, and it so happened that dollar oil prevailed at that time. A large fire occurred in the yards of the National Storage Company yesterday, destroying about 100,000 barrels of oil. The runs from the oil-wells to the Pipe Line Company during the first seven days of this month are considerably less than the deliveries, and they would indicate that the visible supply of oil on June 1st will be less than on May 1st, notwithstanding all the new wells we hear so much about. Petroleum is good goods, and buyers in the neighborhood of from 90 to 93 cents will probably see good profits during the next few weeks.

The following table gives the quotations and sales at the New York Mining Stock and National Petroleum Exchange.:

		Opening.	Highest.	Lowest.	Closing.	Sales.
May	5....	$0.91⅞	$0.92	$0.91¼	$0.91⅝	1,059,000
	7....	.91¼	.93¼	.91⅝	.93	1,722,000
	8....	.93⅝	.94¼	.93	.93½	1,974,000
	9....	.92⅞	.94⅜	.92¾	.93¾	2,319,000
	10....	.95	.95⅛	.92⅜	.93	2,129,000
	11....	.92⅞	.93⅞	.92½	.92¾	2,153,000
Total sales						11,356,000

At the annual election of the New York Petroleum Exchange, Mr. L. H. Smith was re-elected President without opposition. The rest of the ticket elected is as follows: First Vice-President, W. H. Johnson; Second Vice-President, D. R. Offley; Treasurer, Henry M. Curtis; Secretary, William Fisher; Directors, Nicholas Mehlen, E. K. Willard, James A. Waugh, H. L. Hotchkiss, P. V. C. Miller, C. E. Orvis, Frank Kimball, H. L. Horton, P. B. Crosby, W. H. Henriques, James L. Anthony, J. W. Copmann, G. R. Gibson, Livingston Roe, F. H. Cohn, F. D. Stead, Irving S. Bernheimer, H. O. Beebe, Minott Mitchell, Josiah Lombard.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, May 10.

The market continues to rule generally dull, and with a single exception prices are fairly steady. Ingot copper is firm at about 16c., which tends to hold the dividend-paying stocks firm, while the absence of any speculative demand for low-priced stocks has a tendency to render the market dull and uninteresting. The feature of the week in coppers is the rise in Quincy, which, in the early dealings, sold very freely at $40⅛@$40½; but the market being cleared of all the

Digitized by Google

floating lots, the price readily advanced on small sales to $45⅛, closing quite strong to-day at $45 bid. There is nothing that we can learn to warrant the advance beyond the fact that it has been unduly depressed, and that for a dividend-paying mine like the Quincy forty dollars seems a very low price, and this naturally brought in buyers. Calumet & Hecla declined from $234@$232, but rallied later and sold at $233. The April product of the mine was over 1600 tons. Franklin advanced from $10@$10¼ on sale of 25 shares only. Pewabic improved from $4@$5. There is but little of this stock offered in the market at present, holders being disposed to pay the assessment and wait for results. Osceola continues to be heavy, and declined from $21½@$21. Huron sold at $1⅛, same as last week.

In silver stocks, Bonanza, which last week sold up to $2⅛, has been heavy, and declined to $2. Catalpa advanced from 67½@77½c., and has been fairly active. Sullivan sold as before at $1¼. Harshaw, at $⅝@$½. San Pedro, at 50c.

At the Boston Mining Exchange, there has been no feature of interest, and prices are without material change.

3 P.M.—At the afternoon Board, Quincy sold at $45⅛@$45, closing at $44½ bid. Osceola, $21. Allouez, $2 asked. Atlantic, $11 asked. Bonanza, $2@$2⅛. Catalpa, 72½@75c. Franklin, $10 bid. Pewabic, $4½@$6. Silver Islet, $4@$5. Sullivan, $1 bid. San Pedro, 50c. asked. Huron, $1⅛ bid. Harshaw, $½@$¾.

BULLION MARKET.

NEW YORK, Friday Evening, May 11.

The declining tendency of the market noted by us for several weeks past has been more marked the past few days. But for an advance in sterling exchange, the rate would be only about 109 per fine ounce. The market in London is very dull and nominal, with no demand for the East Indies.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended May 11th, as compiled from various sources, amounted to $157,000, as against $130,000 reported for the previous week. The receipts from January 1st, 1883, to date are $4,836,713.53.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended May 5th	$98,000
Corresponding week last year	2,534,760
Since January 1st, 1883	5,326,867
Corresponding period last year	17,454,113

Imports.

Week ended May 5th	$29,251
Corresponding week last year	37,798
Since January 1st, 1883	6,495,259
Corresponding period last year	1,504,879

United States Assay-Office at New York.—Statement of business for the month ended April 30th, 1883:

Deposits of gold:		
Foreign coin	$960,000.00	
Foreign bullion	43,500.00	
United States bullion	470,000.00	
United States bullion (re-deposits)	47,200.00	
Jewelers' bars	59,300.00	
Refined gold	127,000.00	$1,707,000.00
Deposits of silver:		
Jewelers' bars	16,000.00	
Foreign coin	4,700.00	
Foreign bullion	23,000.00	
United States bullion (contained in gold)	6,000.00	
United States bullion (re-deposits)	200.00	
United States bullion, Arizona	7,500.00	
United States bullion, Colorado	23,000.00	
United States bullion, Dakota	12,400.00	
United States bullion, L. Superior	600.00	
United States bullion, Montana	58,500.00	
United States bullion, Nevada	7,.00.00	
United States bullion, N. Mexico	20,700.00	
United States bullion, Utah	109,300.60	
Refined silver	109,000.00	398,000.00
Total deposits		$2,105,000,00
Gold bars stamped	1,351,472.99	
Silver bars stamped	326,300.21	1,714,673.20

Foreign Bank Statements.—The governors of the Bank of England, at their regular weekly meeting, advanced the bank's minimum rate for discount from 3 to 4 per cent. During the week, the bank lost £462,000 bullion, and the proportion of its reserve to its liabilities was reduced from 34 1-16 to 33 7-16 per cent, against 42¾ per cent at this date a year ago. The weekly statement of the Bank of France shows losses of 537,500 francs gold and 1,675,000 francs silver.

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.11 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 14⅛ per cent, to arrive at actual value.

METALS.

NEW YORK, Friday Evening, May 11.

Copper.—So far as Lake copper is concerned, the position is better, and it could not be possible to do much better than 16c. even in round lots. Small parcels have already sold at that figure, and 15⅛c. is in vain bid for rounder lots. In sympathy therewith the best brands of outside copper, like "Anchor" and Baltimore-Arizona, are more firmly held, while some outside brands have still been sold as low as 14¼c. England cables this week £68@£68 15s. for Best Selected, and £62@62 5s. for Chili Bars.

Tin.—Our market has been quiet, with limited transactions at 21¼c. cash for Straits, and 21⅛c. for futures, 21⅛c. for Australian, 22c. for Banca, and 21⅛c. for Lamb & Flag. England cables at the close £96.

Lead.—The market has been very quiet and dull. We hear that offers have been solicited at 4·30c. for Common, without leading to any business, while the best offer for Refined has been 4.40c.; the outlook is not promising.

From St. Louis, Messrs. John Wahl & Co. wire us as follows to-day:

The market is a little easier. Sales for the week run up over 350 tons. Refined at 4·67½c., a small lot at 4·15c., 140 tons at 4·12½c., and 90 tons of Hard lead at 4·05c.

Messrs. Everett & Post telegraph us from Chicago to-day:

Our market is quiet and dull. Sales amount to 400 tons at 4·15@4·10c. Refined is nominally 4·15c.

Spelter.—There have been small sales of good ordinary brands at $4.75, while other brands are quoted as low as $4.70.

Antimony.—Nothing has been done. We quote Hallett's 9¾@9⅞c., and Cookson's 10¾@10⅞c.

Quicksilver.—The San Francisco *Commercial Herald* says that sales are making from the wharf at 35½c., as occasion offers. The market is flat and devoid of all animation, quotable at 35@35½c., or $27.25@$27.50 per flask.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, May 11.

Mr. James M. Swank has compiled from the reports of Mr. Edward J. Shriver, of the New York Iron and Metal Exchange, the following table of the imports of iron ore, iron, and steel at the port of New York in the first four months of the present year, in gross tons:

Articles.	Jan. Tons.	Feb. Tons.	March. Tons.	April. Tons
Iron ore	2,539	7,598	1,756	5,·55
Pig-iron	7,801	8,815	9,673	5,205
Spiegeleisen	1,106	1,010	3,169	4,312
Old rails	1,624	852	740	54
Scrap-iron	3,569	798	2,806	1,655
Scrap steel		370	1,051	1,344
Steel blooms	138	100	14	
Steel rails	270	403	2,460	1,559
Steel wire rods	11,641	8,898	12,873	9,661
Iron wire rods	714	1,378	202	493
Swedish iron	619	981	1,306	839
Iron bundles and bars	21	44	213	43
Iron beams	652	123	408	269
Hoop iron		310	370	144
Sheet iron	246	182	356	214
Steel bundles, bars, etc.	675	567	480	382
Steel tires and forgings	177	291	303	362
Tin plates	6,965	6,821	8,181	8,494
Total, except ore	36,018	31,943	44,605	35,069

American Pig.—The market is a little better; sales during the week, chiefly small lots, aggregate from 2000 to 3000 tons of Foundry, standard brands, at prices very near $20@$22. Outside brands are selling for 50c.@$1 less, but there are indications that the supply of Foundry pig will be soon reduced to a proportion more closely approaching the consumption. We learn that one or two furnaces have already blown out, and that eight in all in the Lehigh and Schuylkill valleys will follow at an early date. Until definite news to that effect has been obtained, and buyers have the assurance that there are no surplus stocks to work off, they will continue to operate very cautiously. We quote, as last week, good to choice brands at tide-water, $21.50@$22 50 for No. 1; $19.50@$20.50 for No. 2; and $18@$19 for Gray Forge.

Nothing of interest is to report in Bessemer pig, while Speigeleisen moves off fairly at $26.50@$27 for 10 to 12 per cent, and $32 for 20 per cent.

Scotch Pig.—The market is quiet, sales being light and being chiefly in very small lots. Arrivals are moderate, the iron partly going into store and partly into consumption. Freights are 5s. We quote: Coltness, $24@$24.50 ex ship; Glengarnock, $22@$22.50; Eglinton, $21@$21.50; and Summerlee, $24@24.25.

Steel Rails.—Eastern mills are well supplied until fall, and some of them as late as November, and it is difficult to place orders for any thing earlier than September. Little business has been done, and quotations remain nominal at $38 at mill.

Old Rails.—There is nothing of interest to report. We quote $23@23.50 for Ts.

Scrap.—Scrap is dull and weak, with values at $24@25 ex ship.

Philadelphia. May 11.

Leading consumers in the iron trade who have been interviewed this week in regard to the outlook for trade during the summer are of opinion that consumption will be large; but they look for declining prices, and are unwilling to accept offers made by furnace companies for ninety days' delivery at present quotations, which are $20@$22. A few consumers have made offers of $21.50@$19.50 for standard Foundry

brands, but these figures are not even considered for good Lehigh irons. Some inferior stuff from the Lehigh Valley would be sold at this figure, and small sales have been already made under $20 @$22. The local mill-owners are reticent as to the probable condition of trade. They are not buying more iron than is needed from week to week, and have declined concessions made by furnace representatives to buy at $18 at furnace. Inferior brands have been offered at $17@$17.50; but consumers look for a weakening of prices of standard brands, in consequence of a probable suspension of consumption in the West. At least until this uncertainty is disposed of, they will not place large orders. Forge iron was bought at $18 at furnace this week, and this is about a fair quotation for good iron. Bessemer is offered at $22@$22.50, but no transactions of note are heard of. The offers of $21@$21.50 are still on the market. Handlers of Scotch iron report a dead market.

Muck Bars are quoted all the way from $33.50@$35. A good many sales have been made at an average of $34.50, mill. Charcoal Blooms are in dull request at $62@$64. Anthracite are quoted from $53@55. The downward tendency has induced buyers to hold off, though consumption is as large as heretofore.

Merchant Iron.—The store-keepers are selling iron in small lots to the retail trade at 2·30c. Manufacturers are seeking business at 2·20c. Large lots could be sold at 2·15c. Small orders are not so much desired as two or three weeks ago. Mills have very little business on hand. Common iron is in quite active demand at country mills at 1·80@2c. Mills in the interior are better supplied with business than in this city. Skelp iron is moving in occasional large lots, but at very low prices.

Wrought Pipes and Tubes.—Discounts on wrought pipes are 70 per cent off, and even this figure is shaded in occasional instances. Tubes are 60 off. There is a very fair consumption, but buyers are purchasing mostly in small lots.

Nails.—Manufacturers of nails are quite satisfied with the past and present condition of the trade and its prospects. Country mills are selling at $3.05, and city mills are filling orders at $3.10@$3.20. Prices are perceptibly firmer, and, with the heavy consumption going on, there is every indication that business will continue in its present satisfactory shape.

Structural Iron.—Two or three specifications have been submitted by bridge-builders for iron for August and September delivery. The present is considered a good time to place orders, and manufacturers are shaving very closely to secure the business. Trade, as a general thing, is confined to small lots of from 10 to 25 tons. Retail quotations are 2·40@2·50c. for Angles and 3½c. for Beams and Channels.

Plate and Tank.—There is less to say of Plate and Tank than usual. Quotations are given at 2½c. for Common Plate, 4¼@4½c. for Flange, and 3¼c. for Shell. The business is in retail lots; but few large orders have been brought before the market.

Sheet-Iron.—Sheet-iron manufacturers are doing a fair business in a retail way, but large buyers still hold back.

Steel Rails.—Nothing of an unusual character has taken place for a week, but inquiries have been responded to at $38 for large blocks for fall delivery. Rail-makers are still anxious to secure business, especially in large orders. Small lots are $39@$40. Light sections, $42@$43.

Old Rails.—Old rails are dull at $24 for Tees and $28 for Double-Heads. There are buyers around, but they will not pay these prices.

Scrap.—Cast scrap sold as low as $17.50@$18. No. 2 Scrap sold at $23.50@$24.50; No. 1, $25.50@$27.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, May 11.

Anthracite.

We can not record any changes in the situation. The only point of interest discussed to some extent is whether or not half-time work will be decided upon for the rest of the month. The feeling is, that it is decidedly desirable, unless the much more efficient course of stopping for a whole week or two is adopted.

Navigation of the lakes is fairly opened, and shipments to lake ports have begun.

The election of the New Jersey Central Railroad was held to-day, and a Gowen-Garrett board was elected, which decides the question of the lease. The proposition of the Reading Railroad is, to acquire the Central road from September 1st, under a lease for 999 years, paying all fixed charges, and guaranteeing a dividend of 6 per cent a year, semi-annually.

Bituminous.

The bituminous coal trade is in an attitude of suspense. The annual battle for the control of the season has been practically fought, and nothing but one or two railroad and steamship contracts remain to be fought over. The Cumberland interest has been badly beaten, the bulk of the business having been carried off by the Clearfield operators, who have not alone held the ground captured during the past few years, but have conquered additional territory. It is estimated that while the Cumberland operators have taken 500,000 tons of tide-water to order, the Clearfield operators have secured three times that amount. When it is remembered that the former district has no local trade worth speaking of, while the latter has an important outlet along its line, it will be conceded that the situation is a very painful one. It is of no use to inquire into the manner in which this victory has been achieved. The question at issue now is, What are the great Cumberland mines and the Baltimore & Ohio Railroad Company going to do about it? It is regarded in some quarters as being too late; while in others the opinion is held that there is a prospect of a heavy fight, and there are indications that this struggle will be made. It is understood in the trade that the Baltimore & Ohio Railroad is now giving special rates, and it is argued that, if the railroad company were to decide to make a heavy cut, and thus run prices at tide-water down, the result would be that contractors would back out of their engagements, and supply themselves with the cheaper coal obtainable in the open market. This argument, forcible as it is, presupposes, however, that such a condition of affairs would be kept from the shippers who supplied contract coal, and that the Pennsylvania Railroad would not promptly follow. It is urged that, even if not much coal would be thus diverted to the Cumberland region, the loss to the Pennsylvania Railroad would be immeasurably larger than to the Baltimore & Ohio, and might be adopted by the latter as a retaliation. Such is the current talk among the trade, and it has its foundation in the recent concessions by the Baltimore & Ohio, which were too late in most instances, but early enough to secure a portion of the Old Colony Railroad contract of 20,000 tons to the Cumberland Company shipping from Baltimore, the rest going via Georgetown.

The contract for supplying the Long Island Railroad was taken for $3.75 alongside, the lowest figure of any yet reached, and entirely exceptional. The bulk of the steamer contracts, including that of the Inman line, was taken by Clearfield.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended May 5th, and year from January 1st:

TONS OF 2240 LBS.	1883. Week.	1883. Year.	1882. Week.	1882. Year.

Horsford's Acid Phosphate

In Sick Headache.

DR. FRED. HORNER, JR., Salem, Va., says: "I know of nothing comparable to it to relieve the indigestion and so-called sick headache and mental depression incident to certain stages of rheumatism."

WANTED.—A POSITION AS A BOOK-keeper or cashier in banking or manufacturing firm. Competent and references. Address R. G., P. O. Box 1833, New York.

KERL'S ASSAYER'S MANUAL

JUST READY.

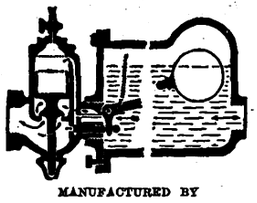
The Assayer's Manual. An abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor of the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brannt. Graduate of the Royal Agricultural College of Eldena, Prussia. Edited by William H. Wahl, Ph.D., Secretary of the Franklin Institute, Philadelphia. Illustrated by 65 engravings. In one volume, 8vo, 30 pages. Price $3, *by mail, free of postage, to any address in the world.*

EXTRACT FROM THE PREFACE.

"In view of the well-known thoroughness and accuracy of Bruno Kerl's various metallurgical works, the preparation of the present edition of his abridged Manual of Assaying has been undertaken with the conviction that it would be doing a real service to English-speaking students and teachers of the subject. Though presented in very condensed form, every method of importance will be found to have received notice, and its practical value duly estimated at its proper worth."

CONTENTS.—GENERAL DIVISION.—I. Mechanical Manipulations. II. Chemical Operations. III. Assay Furnaces IV. Assay Vessels. V. Balances and Weights. VI. Tools and Implements. VII. Assay Reagents. SPECIAL DIVISION.—I. Lead. II. Copper. III. Silver. IV. Gold. V. Platinum VI. Nickel. VII. Cobalt. VIII. Zinc. IX. Cadmium. X. Tin. XI. Bismuth. XII. Mercury. XIII. Antimony. XIV. Arsenic. XV. Uranium. XVI Chromium. XVII. Manganese. XVIII. Sulphur. XIX. Fuels. APPENDIX.—A. Tabular Synopses. B. Lower Harz Working Assays. C. Schaffner's Assay of Zinc as modified by Bunnlechner. Index.

☞ The above, or any of our books, sent by mail, free of postage, at the publication price, to any address in the world.



☞ Our new and revised CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS—86 pages, 8vo—and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one, in any part of the world, who will furnish his address.

DURING the course of a discussion before the Hanover Section of the German Society of Engineers, on a paper dealing with the Loiseau process of manufacturing artificial fuel, some points were brought up in regard to the treatment of lignites which may be of value to those in the West to whom only that fuel is accessible. Experiments have been made by F. FISCHER with lignite containing 60 per cent of water and having a calorific value, when coming from the mine, of from 1000 to 1500, and when dry of from 3000 to 3500. He found, after a series of trials with an experimental plant, that the best temperature for coking lignite with the aid of steam was 450 degrees Celsius, obtaining thereby 32 per cent of the weight of the moist lignite in the form of coke, holding from 6 to 7 per cent of ash, and having a calorific value of 7500, equal to a fair bituminous coal. Coking lignite with superheated steam has been for many years in practical operation at Vordernberg, Austria.

FRANCE glories in a new mining paper, paying special attention to gold, silver, copper, and diamond mining enterprises. The *Bulletin des Mines*, as our new friend is called, appears to be quite an enterprising journal, and has a wonderfully well-posted American "correspondent," who, we shall be rash enough to presume, resides somewhere in this country. That person promptly appropriated an article on the Lexington mill, written by Mr. C. A. STETEFELDT; but finding it impossible to appreciate some of the most important sections of the paper, dealing with intricate metallurgical questions, let them severely alone, simply sweeping them aside, because lacking the brains to understand their value. He took unto himself all the facts submitted to the public through the ENGINEERING AND MINING JOURNAL by Mr. MEDHURST, of the Lexington Company, and calmly submitted them as the result of his own profound researches, until, emboldened by success, he threw aside a thin disguise, and appeared upon the scene as the editor in person! In our issue of March 31st, Dr. EDWARD D. PETERS, Jr., of this city, warned our readers against the processes for the electro-amalgamation of gold ores, which are now attracting so much attention in England, and it seems in France. In the last issue of the *Bulletin*, we find this communication in full, but without any signature, prefaced with the following words, "The following letter has been sent to us," and to its end we find tacked the following bit of editorial comment: "Without wishing to displease our correspondent, we persist in believing that the last word has not been spoken on the treatment of ores by electricity. We shall perhaps before a long time prove that it is capable of being practically solved." We are glad to see that the editor is afraid to displease Dr. PETERS, although an ocean rolls between them, and although that gentleman probably does not know of the existence of the polite but unscrupulous editor of the *Bulletin*, who is welcome to the valuable matter he finds in the ENGINEERING AND MINING JOURNAL, which he may "translate" as much as he likes without giving credit, so long as it does not bear the full signature of a correspondent or appear as an original paper by a contributor whose full name is published. In such cases, we cease to be indifferent, and must insist that full credit be given at least to the writer, if not to the JOURNAL.

THE island of Elba has for many centuries enjoyed the reputation of being an inexhaustible treasure-house of iron ore. These illusions have been rudely shaken of late by the careful study of the deposits by competent engineers. FABRI, PELLATI, MELLINI, and CZYSZKONSKI have in turn cut down the estimates of the ore in sight, and now MM. JEAN BECO and LEON THONARD, in a very interesting paper contributed to the *Revue Universelle des Mines*, furnish additional evidence pointing to the early exhaustion of the mines of Elba. The source of the enormous aggregate production of iron ore from the island was five deposits, named, in their order going from north to south, Rio Albano, Rio, Vigneria, Terra-Nera, and Calamita. Large quantities of mineral were and are still obtained by washing the ancient dumps. The greatest mine, the Rio, is estimated to have yielded between twenty and twenty-five million tons of ore; and yet, with the adjacent Vigneria, it does not contain more than three million tons still in place. Terra-Nera is practically exhausted, while Rio Albano is still good for two million tons. Calamita has apparently two million tons of magnetite, and may develop great resources; but as the ore is much mixed with rock and copper pyrites, many believe that the deposit does not hold much marketable ore. MM. BECO and THONARD put it down for one million. The old dumps have been similarly overestimated, and, according to recent observations, are not regarded as capable of furnishing one million tons; thus carrying the total to approximately seven millions of tons, which would furnish supplies for only thirty-five years at the rate of 200,000 tons per annum. If any effort is to be made to build up an Italian iron industry consuming at the rate of 100,000 tons of ore per annum, an export of iron ores to any extent can not be thought of. MM. BECO and THONARD urge that, however gloomy this outlook for Elba may appear, the prospects are not much better for Africa and Spain. The mine at Bone, Africa, is exhausted, and the Mokta, which, twenty years since, held out such a brilliant future, is not far from its end, so that the company owning it had to buy at a high price the Tafna mines, east of Oran, and was forced to provide at great expense new shipping docks. The famous Sommorostro mines near Bilbao, Spain, have been similarly overestimated. A few years ago, the ore in sight was placed at one hundred millions of tons; but recent investigations have cut that figure down to one tenth.

Should these statements be borne out by the facts—and so far as Elba is concerned, they can not be much shaken—then the year 1890 may witness some very important changes in the iron industry of the world. England, France, and Germany are getting to be more and more dependent for supplies of ores upon the very countries named, and are taking ever-increasing quantities of foreign ores. Should the more accessible deposits become exhausted, or be unable to maintain their present enormous rate of export, the prices of ores would be increased by the greater cost of developing new ore ground at a greater distance from the coast, thus bringing foreign iron-masters closer to our level so far as access to ores is concerned. The prospect is one which may well serve as a consolation to our poor Lake Superior ore miners, who are now subjected to such intense suffering because they can not sell all the ore they have mined, and propose to take out this year at the bed-rock price from $5 to $8 per ton at Cleveland.

Our Mining Interests.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: There are some facts in the mining statistics from Colorado this year, which unavoidably set one to thinking whether taking out from the earth's depths its mineral deposits of gold and silver is not a safer and more profitable and legitimate business than much that Americans have heretofore considered as their secure and more conservative enterprises.

We see by the statistics in regard to Leadville production, that the output of bullion has steadily increased since 1879, when its gigantic stock companies were floated, from $10,333,740.69 to $18,220,892.64 in 1882. Notwithstanding the gross mismanagement which at that early period loaded the entire district down with stock companies of monstrous size, there has been a steady increase annually of the output of the precious metals.

The whole bullion product of the State for 1882 was $26,750,898, which, according to a mathematical authority, would provide each family in the State with a sum of over $400, which is, we believe, considerably in excess of the results shown per family in the agricultural and manufacturing States. In one county, San Juan, we notice that, with the advent of a railroad in July last, the bullion output sprang from an average for several years of about $25,000 to an average of over a million dollars. There certainly seems to be something worth thinking about in all this. If, with poor management and ill-tempered speculation, and hostile criticisms, and holdings aloof by capitalists, mining districts can go steadily forward, increasing by solid millions each year their product of gold and silver, and almost doubling it in the course of five years, it is a question whether there is not a field in Colorado, and probably in other Western States, for the immediate employment of American capital in safer and vastly more profitable investments than those usually made in other forms of business. We speak entirely of legitimate mining and not of illegitimate stocking. And it would also seem that, unless we seize the opportunity, the English and other people will realize the better part of the business. Already during 1882, several of the lodes or mineral veins of the San Juan have changed hands, and the new owners have been English parties. These people have for a great many years made mining a legitimate and profitable business in other countries than the United States. That many of their investments here have not proved profitable has been because hitherto they have purchased stocks in outrageously overstocked mines, as they have also done in some of our outrageously overstocked railroads, and losses in both cases have been the result. Their present system seems eminently the wise one, that of buying at fair figures the controlling interest in mines, and then working them for the output.

This is legitimate mining, as building a railroad at fair cost is legitimate railroading. The statistics of mining show that, even as badly managed as the business has been in this country by speculators, yet the actual capital invested in mining has given a profit of something over 18 per cent. Of course, capital invested in mining does not include amounts for which property may be stocked. A mine that would be cheap property at one hundred thousand dollars, and possibly prove a bonanza to its owners, can be crushed and loaded down with a stock issue of from five to ten millions of dollars, and then "skinned" for a year, in order that a forced production of ore may sell the stock on the market. Then the next step may be to "hammer" the stock and decry the mine, so that the great multitude is glad to get out at any price, while a few sharp tricksters get the property at pretty much their own figures.

The great showing of Colorado for 1882, with only part of its mines yet reached by railroads, and the fact that much-abused Leadville has constantly increased its bullion product, and almost doubled it since the days of the big excitement, show that even mismanagement, while it may bring stock speculators to grief, yet can not crush the business of mining, which is as old as man himself. Take this same Leadville, as perhaps the most ready example at hand. Suppose that any of the ill-managed banks, iron mills, or railroads, the ownership of stock in which has caused considerable grief, were asked for a show of assets since the time their stock went down with a run. It would be a novel showing indeed for them could the assets be proved to have increased annually, notwithstanding their troubles, and at the end of five years to be yielding almost double what they did in their time of greatest prosperity.

Indeed, it seems very much as if the miners of the Centennial State could very fairly twit their conservative brethren of the East with being engaged in very much the most hazardous kinds of business.

The number of highly respectable banks, rolling-mills, railroads, factories, and what not that have plunged their stockholders and owners into weeping and wailing in the twelve months sets one to thinking and asking, How shall American capital be invested? And why can not the taking out of the precious minerals be the safest business that speculative man indulges in to-day? Suppose that a man or a set of men purchase a mining property, for instance, a fissure-vein that has been developed sufficiently to demonstrate the existence of a body of promising mineral. Suppose they set men and appliances at work to mine the ore, the same as coal is mined for shipment to a market, using the same good judgment and the same economical use of labor that the owner of a coal mine uses in mining his coal and shipping it to market for a profit. With gold and silver ores, the immediate product is cash, solid cash, and nothing else; no credit given, no trusting on time sales with payments running into months and years; no material and no manufactured stock to carry, subject to the ups and downs of commercial and manufacturing life.

If they find the mining and shipping of ores profitable, well and good; they are satisfied, and the business goes steadily forward year after year, yielding its 10, 20, 50, or more per cent of profit. Should a time ever come when the ores can not be profitably mined and shipped, they stop work. There would be comparatively little dead material on hand except the mine itself, which, in its past working, may have paid for itself a hundred-fold, as mines have done time and again. At any time, and on very short notice, they can stop work and be quit of it all, at least, and need not take a year, or five years, to be able to let go of the thing, as it does in many other forms of business.

As a fair illustration perhaps of what legitimate mining may accomplish, the Rio Tinto mine, capital six million pounds sterling, managed by English capital, and the Tharsis, capital one million pounds sterling, also owned and managed by an English company, and both situated in Spain, may be cited. The total value of the different minerals taken from these mines is but $10 per ton, being less than one seventh of the value of what would be called very ordinary ore in America. And yet the Tharsis mine, which is now an old one, sells in London at £45 for £10 shares. The Rio Tinto, which is yet but a few years old, sells at £17 for £10 shares, with a constantly increasing value. These figures may fairly give an inkling of the future that awaits the great mineral deposits of Colorado when business management has fairly taken, as it is now rapidly doing, the place of mere stock speculation.

An eminent English engineer, while lately examining the large fissure-veins of the San Juan region, in Colorado, declared that English companies could make all the money they desired from such masses of mineral if they should yield but $20 per ton of silver. As the average of the large bodies of mineral in the San Juan is stated to be about $60 per ton, it would seem as if legitimate mining might be made rather profitable there.

From the statistics of mining the world over, it would at least seem fairly certain that *legitimate* mining can rather more than hold its own, in comparison with other methods of popular investment. One can have the reins of venture more firmly in hand if he will, than either in railroading or manufacturing, and whatever product he may get certainly possesses the advantage of a universal and fairly regular market. He can own and entirely control his venture, which is rather more than can be said of the ordinary stocks and bonds that seek and very often ingulf the investing public. As we have before remarked, mines can be stocked illegitimately and worked disastrously, as many railroads and financial institutions are, or they can be worked legitimately for their output, and fortunes be realized by their owners. We believe also that they can be worked on a prudent basis more easily, and let go of more quickly when one wishes, than is the case in many other ventures.

NEW YORK, May 10, 1883. W. E. W.

The Bessemerizing of Copper Matte.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In your issue of April 21st, I stated that I *believed* that oxidizing copper sulphides by a blast of air so rapidly as to generate a great quantity of available heat (to which I perhaps too closely restricted the term Bessemerizing) had been first described by Hollway, as applied to rotating Bessemer converters, and first by myself, as applied to reverberatories. I did not then, nor can I now, make a positive statement, not having leisure for the complete study of the history of the subject which should precede such a statement. Perhaps I should have limited the supposed priority to utilizing the heat so generated for fusing fresh portions of sulphides, which is indeed the important point claimed by Hollway and by Eustis and myself.

Messrs. Johnsson and Raht reply, in your issue of May 5th, by quoting the processes of Raht, of Jossa and Laletin, of Rittinger, and of Stridsberg and Kollberg. The patent of W. L. Raht, which I suppose to be the one referred to, as given in your 27th volume, page 260, does not even suggest the generation of heat at all. Jossa and Laletin indeed treated matte in a Bessemer converter. But I can not find that they looked for any *great* generation of available heat. In their calculations, they counted on making two blows a day in each converter. Besides strongly preheating the converter, they evidently considered that it might be necessary to add fuel, and even melted cast-iron, to keep up the heat. Their blows lasted as long as two hours, while Hollway's required only from 11 to 18 minutes in his first series of trials.

From this, I infer that they hardly contemplated generating more heat than that needed to make up for the losses by radiation, etc. As with this process, so with those of Tessié du Motay, of Rittinger, of Keates, and others, it was, perhaps, foreseen that a certain amount of heat would be generated; but I find no proposal to generate in this way an amount of available heat which could be called great, when compared with that projected by Hollway and by Eustis and myself. Of course, my failure to find such a proposal recorded does not prove that it does not exist.

From what Mr. Johnsson says as to the origin of the ideas which he claims, we must admit that he may be simply the victim of an unfortunate chain of circumstances. H. M. HOWE.

BOSTON, May 15, 1883.

Arsenic and Zinc in Pyrites.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: I must take exception to some parts of Mr. Whitmore's article in your issue of the 12th inst. He says he has "been informed" that the Rowe ore (Davis mine) contains as much arsenic as the Milan. This I most emphatically deny. The ore from the Davis mine has no trace of arsenic in its composition. We have a laboratory at the mine, with all the necessary chemicals and apparatus for arsenic tests by at least two methods, our chemicals being bought from Messrs. Eimer & Amend. I challenge Mr. Whitmore, or any reputable chemist he may send to our mine, to take samples from the mine directly and obtain therefrom in our laboratory the faintest trace of arsenic.

Mr. Whitmore further says (probably has been informed) that on top of pyrites deposits are usually found zinc and galena. I beg to say that I have seen several pyrites mines, and so far the only one of which this is true is the Milan mine.

He also states that J. D., Jr., says our ore is soft. If I remember correctly, J. D., Jr., says that it is granular in structure, rendering it easily broken. To this fact is largely due its remarkable free-burning quality and its dense gas. With our ore, at least one third less brick is required to build the kilns, and one third less iron for

Digitized by Google

supporting pont, etc. This is an important item in first cost. An average of several thousand tons of our ore actually made into acid by different firms shows over 45 per cent sulphur recovered. Our ore contains no deleterious impurity, and almost no silica.

Nearly one thousand tons of our ore are burned monthly at present, and the quantity is gradually increasing. I shall be glad to have any one interested in burning pyrites personally or by representative visit and examine our mine, and obtain ocular information. We have two hundred thousand tons of ore that can be seen in the mine, and ten thousand tons which we have raised to the top of the ground. We are raising two thousand tons monthly, and have sufficient hoisting power erected to increase this to seven thousand tons.

I think too many wild statements have been made on this subject by parties interested in the sale of ore. Acid-makers can accurately calculate the relative cost of brimstone and pyrites after they know for a certainty where a permanent supply of first-class ore can be obtained, and its price, delivered at a certain point. As far as transportation to market is concerned, we certainly are advantageously situated.

The Davis mine is in the town of Rowe, Franklin County, Mass.; is four miles from the railroad at Charlemont, and eight miles from the Hoosac Tunnel. Every rod of the road is descending from the mine to the railroad. We can easily and cheaply build a gravity or tram railroad whenever required. The railroad is owned by the State of Massachusetts, and all connecting lines have equal privileges and rates. Four lines already run over this road, namely, the Boston, Hoosac Tunnel & Western and the Troy & Greenfield Railroad run to tide-water at Troy, 60 miles; the Fitchburg Railroad to Boston, 119 miles; and the New Haven & Northampton Company, to New Haven, 108 miles. We are now shipping to these points. Thanking you for your valuable space,

I am, yours truly, H. J. DAVIS.

CHARLEMONT, MASS., May 16.

NEW PUBLICATIONS.

ELECTRO-MAGNETS: THE DETERMINATION OF THE ELEMENTS OF THEIR CONSTRUCTION. By TH. DU MONCEL. (Translated from the Second Edition.) New York: D. Van Nostrand. 1883. 18mo, 122 pages.

The reputation of the Count du Moncel as a practical electrician, a scientific investigator, and a writer on subjects connected with electrical science is so thoroughly established that this little book scarcely needs a recommendation. To all who are engaged in the practical construction of electro-magnets, it will be extremely useful. The mathematical investigations connected with this subject are of so high an order that it is difficult to separate that which is practical from that which is purely theoretical. This Du Moncel has done, verifying the formulas adopted by the most careful experimental research. If we are not mistaken, this intelligent and satisfactory translation was made by Prof. G. W. Plympton, the accomplished editor of Van Nostrand's *Engineering Magazine*.

POCKET LOGARITHMS TO FOUR PLACES OF DECIMALS, *including Logarithms of Numbers and Logarithmic Sines and Tangents to Single Numbers; to which is added a Table of Natural Sines, Tangents, and Cotangents.* New York: D. Van Nostrand. 1883. 18mo, 139 pages.

To the practical computer, a table of four-place logarithms is extremely useful, especially in astronomical, geodetic, and electrical field-work. For office use, the card form is perhaps the most desirable; but for use in the field, nothing could be more convenient than this little book. It is clearly printed, and small enough to be carried in the pocket. The table of Natural Trigonometrical Ratios is a very useful addition. It is rarely given, though it always ought to be, in connection with logarithmic tables.

TECHNOLOGISCHES WÖRTERBUCH IN ENGLISCHER UND DEUTSCHER SPRACHE. (Technical Dictionary, English and German.) By GUSTAV EGER. Part I. English-German. Revised by OTTO BRANDES. Brunswick: Vieweg und Sohn. New York: B. Westermann & Co. 1882. 8vo, 710 pages. Unbound, $4.40.

Technical dictionaries are of all the most difficult to compile, and are usually among the most unsatisfactory. In all branches of arts and manufactures, there are so many local terms, and in the different languages there are words used to designate so many different things, that the task becomes fairly bewildering. There is another circumstance which tells against such works. Technical dictionaries often fall into the hands of persons who have not even a faint notion of the subject they have taken in hand. Such persons seize at haphazard one out of many words before them, and build up with much toil and much ignorance those wonderful translations that occasionally startle and amuse the public. Naturally an incompetent translator tries to fix the blame on the technical dictionary. In the work before us, brief explanations are occasionally given of obscure terms. Examination of words in engineering, mining, and metallurgical practice shows careful work, and the long list of names of gentlemen who have aided in the compilation gives assurance that other departments have not been neglected. Prof. J. G. Lunge, of Zurich, has supervised chemistry and chemical industries; Mr. G. Schaeffer, of Newcastle-on-Tyne, engineering; Dr. Bedson, of Manchester, mining and metallurgy; Dr. Burghardt, mineralogy; Dr. Carnelly, botany; and Mr. W. Carleton Williams, forestry, these three last-named gentlemen being also of Manchester.

SMELTING PLANTS. By JOSEPH M. LOCKE, C.E., M.E. Cincinnati: Published by the Lane & Bodley Company. Square 8vo, 26 pages, illustrated.

With the object of educating their customers, many of our manufacturers of machinery are beginning to publish brief monographs, elementary in their character generally, on the particular branch of their business in which experience has taught them such enlightenment is necessary. However much the fact may be deplored that parties having no knowledge of the working or the adaptability of a given kind of plant are the ones who order it, our machinery firms have to meet the case as they find it. They take orders from any responsible party; and though it can not be a matter of indifference to them whether the machinery will rust away in some nook in the mountains after a brief spurt of activity, they do the best thing under the circumstances, in advising and instructing their customers. The little book before us, containing only 26 pages, handsomely printed and well illustrated, is a good example of the class of literature which these circumstances have called forth. It does not pretend to give any data with which every practical smelter is not thoroughly familiar; but it does furnish information, well arranged, to those who probably never saw a copper or lead smelting furnace before. The first chapter contains a good description of the water-jacket furnace built by the Lane & Bodley Company; the second is entitled, "The Selection of the Site of Smelting Plants, and the Adaptation and Equalization of the Plant." We are particularly struck with the utility of the latter chapter. By following the hints there given, many stupid blunders committed in the past may be avoided in the future.

DESCRIPTION OF THE PORTER-ALLEN ENGINE. By CHARLES T. PORTER. Philadelphia: Published by the Southwark Foundry and Machine Company. 1883.

After many years of work, sustained by an enthusiastic conviction of the correctness of his views on steam engineering, Mr. Charles T. Porter has had the gratification of seeing the engines built in accordance with his plans gaining rapidly in favor as mill engines, in rolling-mills, steel-works, etc. The work before us—for it rises far above the level of the ordinary trade catalogue—gives a description in detail of the different parts of the engines, and enters into a discussion of the advantages of high speed, of the conversion of heat into work in the cylinder, of the attainable limit of economy, the merits of superheating, as against steam-jacketing, etc. The book is beautifully illustrated, and should be studied closely by all who have the management of undertakings in which economy of fuel and efficiency are important factors.

THE ASSAYER'S MANUAL. By BRUNO KERL. Translated from the German by WILLIAM T. BRANNT. Edited by WILLIAM H. WAHL, Ph.D. Philadelphia: Henry Carey Baird & Co. 8vo, 301 pages. (*Index.*) $3.

Prof. Bruno Kerl's great merits as a book-maker as well as his faults are fully understood by metallurgists and mining engineers, his treatises having served generations as works of reference and of study. His industry as a compiler is occasionally marred by his lack of judgment and by his apparent faith in every thing that has received the dignity of print. The practicability of easily and thoroughly testing the accuracy of methods of assaying proposed, and a very long personal experience as a teacher, have made it possible to eliminate faults which his other works exhibit; and therefore both his treatise and his manual on assaying are more accurate and complete than his metallurgical works. His earlier and larger work, of which a second edition was recently published, is extremely elaborate, and is a very valuable book of reference for the assayer's office. Professor Kerl, however, in 1879, wisely published an abridgment, and it is this manual which has now been made available to American readers. Professor Kerl is methodical in this as in all his works. He carefully describes the mechanical and chemical operations, furnaces, tools, appliances, and reagents. In the second part, he goes into a detailed account of the different methods of assaying lead, copper, silver, gold, platinum, nickel, cobalt, zinc, cadmium, tin, bismuth, mercury, antimony, arsenic, uranium, chromium, manganese, and fuels. Iron and steel are entirely omitted as having a field of their own. He has carefully brought up to date all the methods, and we note only a few minor omissions: for instance, the addition of fine silver in assaying slags for lead.

The translation is good, although we notice that occasionally translator and editor have evidently despaired of rendering some of the German technical words, and have printed them without a word of explanation. Thus, on page 134, we find "Darrkupfer," "Fluthafter," "Kiehnstöcke." We may state that "After" or "Fluthafter" are the tailings of dressing-works. "Darrkupfer" and Kiehnstöcke" are the residues of working argentiferous copper by two obsolete processes, by fusion with lead and by subsequent liquation.

The book is well printed and strongly bound, fitting it to resist the hard usage to which such books are occasionally put in the laboratory.

LARGE ANVIL-BLOCKS FOR STEEL-WORKS.

Owing to the rapid and very extensive growth of the manufacture of Siemens steel in Scotland, there has been a somewhat extraordinary demand, says *Engineering*, for large anvil-blocks north of the Tweed within the past few years, and during the past week two, of immense size, have been cast. Until now, there has not been any anvil-block in Scotland weighing more than 140 tons; but on Saturday of last week, one was cast at the Dalziel Steel-Works, Motherwell (Messrs. Colville's), which is said to contain 170 tons of metal, and there is in progress at the steel-works of the Govan Forge and Steel Company, Glasgow, an anvil-block which is estimated eventually to contain about 165 tons of metal. In both cases, these anvil-blocks are intended for use with 12-ton steam-hammers, of which there are already several in regular work in Scotland. The Govan anvil-block will be in two pieces, the larger of which, weighing about 140 tons, was cast last Saturday, in the presence of a large number of representatives of the engineering and allied branches of industry. It was cast in a mold occupying the position which the block will eventually occupy after it has been slowly cooled, and has been canted over upon its proper base. The other portion, which will form the top piece or swage-block, and will weigh about 25 tons, will be cast within the next few days. The mixture used in the anvil-blocks under consideration was about one fourth No. 3 Gartsherrie pig-iron and three fourths scrap cast-iron, two of Ireland's patent cupola furnaces, each capable of melting six tons of metal per hour, being used in the operation and the blast being obtained from a No. 7 Root's blower. The manufacture of this anvil-block is intrusted to Mr. William Ireland, of Manchester, who, during the last fifteen or twenty years, has had a most extensive and peculiar experience in connection with the casting of such blocks, both in this country and in Germany; indeed, in the last-named country he has superintended the construction of somewhere about thirty, of which no fewer than thirteen, of a total of 2000 tons, were made for the Union Company, of Dortmund, five of them being blocks of 175 tons each. For the Osnabrück Steel and Iron Company Mr. Ireland made three blocks, one of which weighed 250 tons, which, like the Govan and Motherwell blocks, was intended for use with a 12-ton hammer.

THE APPLICATION OF ELECTRICITY TO EXPLOSIVE PURPOSES.

Sir F. A. Abel, in the course of a recent lecture before the Institution of Civil Engineers, spoke on the application of electricity to the explosion of submarine mines, for purposes of defense and attack, which received some attention from the Russians during the Crimean war under the direction of Jacobi; thus a torpedo, arranged to be exploded electrically when coming into collision with a vessel, was discovered at Yeni-Kale, during the Kertsch expedition in 1855. Some arrangements were made by the British, at the conclusion of the war, to apply electricity to the explosion of large powder charges for the removal of sunken ships, etc., in Sebastopol and Cronstadt harbors. In 1859, a system of submarine mines, to be fired through the agency of electricity by operators on shore, was arranged by Von Ebner for the defense of Venice, which, however, never came into practical operation. Early in 1860, Henley's large magneto-electric machine, with a supply of Abel fuses, and stout India-rubber bags, with fittings to resist water pressure, was dispatched to China, for use in the Peiho River, but no application appears to have been made of it. The subject of the utilization of electricity for purposes of defense, however, did not receive systematic investigation in England or other countries until some years afterward, when the great importance of submarine mines as engines of war was demonstrated by the number of ships destroyed and injured during the war in America. The application of electricity to the explosion of submarine mines was very limited during that war; but arrangements for its extensive employment were far advanced in the hands of both the Federals and confederates at the close of the war; men of very high qualifications, such as Captain Maury, Mr. N. J. Holmes, and Captain McEvoy, having worked arduously and successfully at the subject.

The explosion of submerged powder charges by mechanical contrivances, either of self-acting nature or to be set into action at desired periods, was accomplished as far back as 1583 during the siege of Antwerp by the Duke of Parma; and from that period to 1854 mechanical devices of more or less ingenious and practical character have been from time to time applied to some small extent in different countries for the explosion of torpedoes. The Russians were the first to apply self-acting mechanical torpedoes with any prospect of success, and had the machines used for the defense of the Baltic been of larger size (they only contained eight or nine pounds of gunpowder), their presence would probably have proved very disastrous to some of the English ships which came into collision with and exploded them. Various mechanical devices for effecting the explosion of torpedoes by their collision with a ship were employed by the Americans, a few of which proved very effective. But although, in point of simplicity and cost, a system of defense by means of mechanical torpedoes possesses decided advantages over any extensive arrangements for exploding submarine mines by electric agency, their employment is attended by such considerable risk of accident to those at whose hands they receive application that, under many circumstances which are likely to occur, they become almost as great a source of danger to friend as to foe.

The most important advantages secured by the application of electricity as an exploding agent of submarine mines are as follows: They may be placed in position with absolute safety to the operators, and rendered active or passive at any moment from the shore; the waters which they are employed to defend are therefore never closed to friendly vessels until immediately before the approach of an enemy; they can be fixed at any depth beneath the surface (while mechanical torpedoes must be situated directly or nearly in the path of a passing ship), and they may be removed with as much safety as attends their application.

There are two distinct systems of applying electricity to the explosion of submarine mines. The most simple is that in which the explosion is made dependent upon the completion of the electric circuit by operators stationed at one or more posts of observation on shore; such a system depends, however, for efficiency, on the experience, harmonious action, and constant vigilance of the operators at the exploding and observing stations, and is, moreover, entirely useless at night, and in any but clear weather. The other, which may also be used in conjunction with the foregoing, is that of self-acting mines, exploded either by collision with the ship, whereby circuit is completed through the inclosed fuse, or by the vessel striking a circuit-closer, whereupon either the mine, moored at some depth beneath, is at once fired, or the necessary signal is given to the operator on shore.

Continental nations have followed in the footsteps of the English, in providing themselves with equipments for defensive purposes by submarine mines, and the Danes, Swedes, and Norwegians have pursued the subject of submarine mines with special activity and success. In the United States, the subject of the utilization of electricity as an exploding agent for war purposes is actively pursued, and important improvements in exploding instruments, electric fuses, and other appliances have been made by Smith, Farmer, Hill, Striedinger, and others already mentioned, while no individual has made more important contributions to the development of the service of submarine explosions than General Abbot, of the United States Engineers.

Illustrations of actual results capable of being produced in warfare by submarine operations have hitherto been very few; but of the moral effects of submarine mines there have already been abundant illustrations. In the war carried on for six years by the empire of Brazil and the republic of Uruguay and the Argentine Republic of Paraguay, the latter managed by means of submarine mines to keep at bay for the whole period the Brazilian fleet of fifteen iron-clads and sixty other men-of-war. In the Russo-Turkish war, submarine mines and torpedoes were a source of continued apprehension, and the French naval superiority was paralyzed during the Franco-German war by the existence, or reputed existence, of mines in the Elbe.

The application of electricity to the explosion of military mines and to the demolition of works and buildings has been of great importance in recent wars in expediting and facilitating the work of the military engineer. The rapidity with which guns, carriages, etc., were disabled and destroyed by a small party of men who landed after the silencing of the forts at Alexandria illustrated the advantages of electrical exploding arrangements, combined with the great facility afforded for rapid operations by the power possessed of developing the most violent action of gun-cotton, dynamite, etc., through the agency of a detonator.

The application of electricity to the explosion of mines for land-defenses during active war is not an easy operation, inasmuch as not only the preparation of the mines, but also the concealment of electric cables and all appliances from the enemy, entails great difficulties, unless the necessary arrangements have been made in ample time to prevent a knowledge of them reaching the enemy.

But few words need be said to recall to the minds of civil engineers the facilities which the employment of electricity to explosive purposes affords for expediting the carrying out of many kinds of works in which they are immediately interested. Electrical blasting, especially in combination with rock-boring machines, has revolutionized the operations of tunneling and of driving galleries; and although, in ordinary mining and quarrying operations, the additional cost involved in the employment of fuses, conductors, and the exploding machine, is not unfrequently a serious consideration, there are, even in those directions, many occasions when the power of firing a number of shots simultaneously is of great importance. There is little doubt, moreover, that accidents in mining and quarrying would be considerably reduced in number if electrical blasting were more frequently employed.

The conveniences presented by electric firing arrangements, under special circumstances, were interestingly illustrated by a novel proceeding at the launch of a large screw steamer at Kinghorn, in Scotland, which was recently accomplished by placing small charges of dynamite in the wedge-blocks along the sides of the keel, and exploding them in pairs, hydraulic power being applied at the moment that the last wedge was shot away.

In the deepening of harbors and rivers, and in the removal of natural or artificial submerged obstructions, the advantages of electric firing are so obvious that extended reference to them is unnecessary.

A substitute for electrical firing, which has been applied with success to the practically simultaneous firing of several charges, consists of a simple modification of the Bickford fuse, which, instead of burning slowly, flashes rapidly into flame throughout its length, and hence has received the name of instantaneous fuse or lightning fuse. The fuse burns at the rate of about 100 feet per second; it has the general appearance of the ordinary mining fuse, but is distinguished from the latter by a colored external coating. Numerous lengths of this fuse are readily coupled up together, so as to form branches leading to different shot-holes, which may be ignited together, so as to fire the holes simultaneously. In the navy, this fuse is used as a means of firing small gun-cotton charges, to be thrown by hand into boats when these engage each other, the fuse being fired from the attacking boat by means of a small pistol, into the barrel of which the extremity is inserted.

JAMES NASMYTH'S GEOLOGICAL VIEWS.

The following abstract from Mr. James Nasmyth's autobiography are of interest as showing what peculiar views that great engineer, whose judgment was so sound in mechanical matters, held on geology. In speaking of an ascent to Vesuvius he says:

"During my visit, the mountain was in its normal state. I mounted the volcanic ashes with which it is strewn, and got to the top. There I could look down into the pit from which the clouds of steam are vomited forth. I went down to the very edge of the crater, stood close to its mouth, and watched the intermittent uprushing of the blasts of vapor and sulphureous gases. To keep clear of these, I stood to the windward side, and was thus out of harm's way.

"What struck me most was the wonderfully brilliant colors of the rugged lava rocks forming the precipitous cliffs of the interior walls of the crater. These brilliant colors were the result of the sublimation and condensation on their surfaces of the combinations of sulphur and chloride of iron, quite as bright as if they had been painted with bright red, chrome, and all the most brilliant of tints. Columns of all manner of chemical vapors ascended from the clefts and deep cracks, at the bottom of which I clearly saw the bright, hot lava.

"I rolled as big a mass of cool lava as I could to the edge of the crater, and heaved it down; but I heard no sound. Doubtless the depth was vast, or it might probably have fallen into the molten lava, and thus made no noise. On leaving this horrible pit-edge, I tied the card of the Bridgewater Foundry to a bit of lava and threw it in, as a token of respectful civility to Vulcan, the head of our craft.

"I had considerably more difficulty in clambering up to the top edge of the crater than I had in coming down; once or twice, indeed, I was half choked by the swirls of sulphureous and muriatic acid vapor that environed me before I could reach the upper edge. I sat down in a nook, although it was a very hot one, and made a sketch of two of the appearances of the crater, which may, perhaps, interest my readers. But I feel that it is quite beyond my power, either by pen or pencil, to convey an idea of the weird, unearthly aspect which the funnel-shaped crater of Vesuvius presented at that time. An eruption of unusual violence had occurred shortly before I saw it. Great rounded blocks of lava had been thrown high into the air again and again, and had fallen back into the terrible focus of volcanic violence. Vast portions of the rugged and precipitous sides of the crater had fallen in, and were left in a state of the wildest confusion. When I visited the place, the eruption had comparatively subsided. The throat of the crater was a rugged opening of more than forty feet diameter, leading down to—where? Echo answers, Where?

"And yet there is no doubt but that the great mass of materials which lay around me, as I made my sketch, had been shot up from inconceivable depths beneath the solid crust of the earth. There still remains an enormous mass of molten materials that has been shut up beneath the crust since the surface of the globe assumed its present condition. The mineral matter had converged toward its center of gravity, and the arrestment of the momentum of the coalescing particles resulted in intense heat and the molten lava of the volcano.

"This seems to me to be the true origin of volcanic heat. It has played a great part in the physical history of the globe. Volcanic action has been, as it were, the universal plow; it has given us mountains, hills, and valleys; it has given us picturesque scenery, gorges, precipices, water-falls. The upheaving agent has displayed the mineral treasures

Digitized by Google

of the earth, and enabled man, by intelligent industry, to use them as mines of material blessings. This is, indeed, a great and sublime subject."

In another part of his work, we find the following somewhat glowing account of the greatest Swedish iron mine:

"My visit to the Dannemora mine, at Osterby, was one of peculiar interest. I may, in the first place, say that the immense collection of iron at that point has been the result of the upheaval of a vast volume of molten igneous ore, which has been injected into the rock, or deposited in masses under the crust of the earth. In some cases, the quarried rock yields from fifty to seventy and even as much as ninety per cent of iron. The Dannemora mine is a vast quarry, open to the sky. When you come near it, the place looks like a deep pit with an unfathomable bottom. Ghost-like, weird-looking pinnacles of rock stand out from its profound depths, but beyond these you see nothing but wreaths of smoke curling up from below. The tortuous chasm in the earth caused by the quarries beneath is about half a mile long and about a thousand feet wide.

"The first process of the workmen in the quarries below is devoted to breaking into small fragments the great masses of ore scattered about after the previous night's explosions. These are sent to the surface in great tubs, attached to wire ropes, which are drawn up by gins worked by horses. Other miners are engaged in boring blast-holes in the ore, which displays itself in great wide veins in the granite sides of the vast chasm. These blast-holes are charged with gunpowder, each with a match attached. At the end of the day, the greater number of the miners are drawn up in the cages or tubs, while a few are left below to light the slow-burning matches attached to about a hundred charged bore-holes. The rest of the miners are drawn up, and then begins the tremendous bombardment. I watched the progress of it from a stage projecting over the wild-looking, yawning gulf. It was grand to hear the successions of explosions that filled the bottom of the mine far beneath me; then the volumes of smoke, through the surface of which masses of rock were sometimes sent whirling up into the clear blue sky and fell back again into the pit below. Such an infernal cannonade I have never witnessed. In some respects it reminded me of the crater Vesuvius, from which such dense clouds of steam and smoke and fire are thrown up. In the course of the night, the suffocating smoke and sulphureous gases had time to pass away, and next morning the workmen were ready to begin their operations as before."

THE INTRODUCTION OF IRRIGATION INTO NEW COUNTRIES, AS ILLUSTRATED IN NORTHEASTERN COLORADO.

At the meeting of the British Institute of Civil Engineers, a paper was read on the Introduction of Irrigation into New Countries, as Illustrated in Northeastern Colorado, by Mr. P. O'Meara, the object of which was stated to be three-fold: First, to give an account of the development of irrigation in Northeastern Colorado; secondly, to inquire into the principles which should guide the introduction of irrigation into new countries; and thirdly, to examine how far the methods pursued in Northeastern Colorado were in accord with them. The *Engineer* gives the following report of the paper in question: The development alluded to was influenced by most of the defects manifested in older countries, such as inaccurate measurement of water, growth of ill-defined rights, excessive waste water, etc., but there was a prospect of improvement through better legislation. The climate of Colorado was described as such that agriculture was all but impossible without irrigation. Both were begun in 1860. There were 155,000 acres under cultivation in 1880, and it was estimated that in 1883 there would be 465,000 acres, with prospects of still further development. The amount of irrigation possible would be limited by the quantity of water obtainable, and by the area which each unit of it could be made to irrigate. It would amount to 9,750,000 acres under an hypothetical water duty of twelve inches in depth for one season.

It was laid down that the duty of water in irrigation must vary with (1) the character and condition of the soil; (2) the rain-fall, temperature, and evaporation; (3) the method of application; (4) the kind of crop; and, in some cases, (5) the depth of the water-line below the surface of the ground. As regards (1) the influence of different soils, this must affect the duty of water, because on the nature of the soil depended the quantity of water it should absorb, and the rate of filtration and of evaporation from within it. The author gave details of experiments made by him to ascertain the amounts of water, and the times required to moisten two different typical soils in the Cache La Poudre Valley, and he drew some inferences from them. The formation of swampy lands and the prevalence of rust in wheat on some of the older farms were held to indicate that the quantity of water required for beneficial irrigation became gradually less year by year for a few years after the commencement. (2) The rain-fall of the season should be added to the artificial irrigation, and account should be taken of the surplus water not absorbed by the soil, otherwise all estimates of water duty must be misleading. The use of ordinary statistics of temperature and evaporation was at present vague and unsatisfactory, owing to the absence of experiments on the drying of soils. Nevertheless, the question of evaporation was so important that it was doubtful if any loss of irrigating power occurred in Colorado other than that which was due to it. (3) Irrigation methods were conducted on two antagonistic principles, namely, to increase to the most profitable extent, in the one case, the quantity of water supplied to a given area, and in the other the area irrigated by a given volume of water. The "Marcite" cultivation of Italy and the "asbestine sub-irrigation method" of California were cited as instances of these. Methods of irrigation were classed under four heads: by sprinkling, by flooding, by distributing through furrows, and by distributing through pipes or drains underground. Sprinkling had been tried in Scotland on seven acres of land by the Duke of Sutherland. The methods of flooding with compartments and of distributing through furrows were described in detail, as also the method of flooding without compartments, as practiced in Colorado. This was characterized as extremely wasteful. It was shown from the experiments on dry soil, before alluded to, that 6 inches or 8 inches in depth, instead of 42·84 inches, as at present extended, ought to suffice for cereals in Colorado. The experience of Professor Blount, of the State Agricultural College, was quoted to show that excellent crops of wheat could be grown with a rain-fall of 4½ inches only without irrigation. As regards (4) the water duty for different crops, it was the degree of moisture required in the soil around its roots, and not the absolute quantity which the plant itself absorbed, that had to be considered. The author furnished, in a tabular form, a list of statistics, derived from various sources, in which he had endeavored to include the essential elements. He considered it, however, to be nothing more than an approximation, because of the incompleteness of almost every statement of the kind. In the column of "totals," the limits of water duty appeared much narrower, because of the rain-fall being added to the irrigation depth, than they would be otherwise. Countries where good crops were grown without irrigation were included in the table, being considered to furnish a "natural duty of water," which should be useful for comparison with water duties in places where irrigation was practiced. Some remarks followed with respect to the peculiarities of certain crops, namely, rice, alfalfa, sugar-cane, summer meadows, potatoes, cereals, and tea. The author then discussed the sources and works of supply, and the legislation of irrigation. The sources were stated to be two, namely, springs and rivers. The supplies were made available for direct irrigation by canals, and for indirect irrigation, after storage, by reservoirs. The works of the North Poudre Irrigation Canal, of a capacity of about 300 cubic feet per second, which had been carried out under the author's charge, were described. Those most worthy of remark were a crib-dam, 30 feet 6 inches high, some shelf-work, tunnels, and "gulch" bridges. Details were also given of a larger canal, the Northern Colorado. These works show a considerable departure from the practice of older countries, owing to the abundance of timber and to the preference of Americans for economy and rapidity in construction over durability. The principal supplies of water in Colorado came from the snows of the Rocky Mountains. The rivers rose, reached their maximum, and fell again, frequently before the end of the irrigation season. Hence measurements of the snow remaining on the mountains were of importance to agriculturists. The construction of reservoirs was dealt with as a means of reducing risk in cultivation in countries where the rivers failed in the crop season. Reservoirs were distinguished as of three kinds: "River-bed" reservoirs for equalizing the flow; "main" reservoirs, which received the entire volume of a canal; and "detached" reservoirs, which received a portion only. A serious error in the construction of some reservoirs in Colorado was pointed out. The gauge first used for measuring water in Colorado was the Max Clark's gauge, and the improved system at present in use, with the formula of Francis: $Q = 3{\cdot}33\,(l - 0{\cdot}1\,n\,h)\,h^{\frac{3}{2}}$, were described and commented on. A short account of the legislation affecting irrigation in Colorado followed. The legal definition of an "inch of water" was given in full. Those laws were such that any holder of land in the State was entitled to take and use the waters of the rivers, and any one could construct reservoirs and store unappropriated water. A fruitful crop of litigation had, as a matter of course, been developed in the State; and some cases were still pending. A series of laws was passed in 1879 to determine the order and priority of existing and future claims, to fix the price of water, and to control its distribution. The author finally directed attention to the report of the State Engineer of California on similar laws, concurring generally with the principles advocated therein, and suggesting a free exchange of water rights, and the condemnation of such reservoir sites as were used for direct irrigation only.

THE EFFECT OF REPEATED HEATING ON STEEL AND IRON.

Mr. J. F. Barnaby has lately presented to the Controller of the British Navy a report giving the results of a series of experiments which he made at the Cyclops Works, Sheffield, to ascertain the effect of repeated heating and cooling on the strength of different makes of iron and steel. The metals submitted to trial were Siemens or open-hearth steel, and Bessemer steel, of about the maximum and minimum strengths allowed by conditions of contract, and Bowling iron and iron of B. B. quality, as made by Messrs. Cammell & Co. for use in her majesty's service. In making the tests, it was endeavored to subject the several samples, as far as possible, to treatment similar to that which they would receive if forming portions of a boiler in actual use. Herewith we give a table showing the average results of the tests of the higher strain Siemens and Bessemer plates, and of the B. B. iron plate:

Treatment of Sample.	Siemens or open-hearth steel.		Bessemer steel, ⅝ boiler plate.		C. Cammell & Co.—B. B. boiler.		Bowling iron.	
	Tensile strain per square inch in tons.	Percentage of elongation in 8 inches.	Tensile strain per square inch in tons.	Percentage of elongation in 8 inches.	Tensile strain per square inch in tons.	Percentage of elongation in 8 inches.	Tensile strain per square inch in tons.	Percentage of elongation in 8 inches.
Normal condition.....	31·115	24·60	31·26	19·14	22·66	7·41	21·08	13·67
Sample heated 3 times ...	30·080	26·56	33·15	21·48	.....	.....	20·28	14·64
" 8 times....	30·580	25·97	32·70	22·06	20·56	7·22	20·36	15·71
" 12 times...	30·620	25·38	33·10	22·06	21·51	9·17	20·64	17·96
" 20 times....	30·750	24·99	32·43	22·45	20·15	7·81	20·02	16·79
" 40 times....	30·750	25·97	32·80	22·45	20·75	8·28	20·70	18·54
" 60 times....	31·440	26·75	32·63	23·25	20·83	8·60	20·35	16·40
Sample placed in the flue of a stationary boiler 16 days	30·770	26·55	28·64	20·11	21·68	7·22	20·20	14·65
Sample placed in smoke-box of a locomotive 16 days...	30·010	26·16	31·09	24·60	20·97	8·17	20.50	13·28
Samples placed in annealing furnace 16 days.....	26·100	28·51	28·25	24·61	15·27	5·85	15·24	11·32

Each result is the average of four tests, two lengthwise of the plate and two across it, except those of the first horizontal line, which are deduced from two experiments only. These show the normal tensile strengths and percentages of elongation of the several plates, each five eighths thick, from which the samples were cut. In the second to the seventh lines inclusive, are shown the strengths per square inch and the elongations obtained after the samples had been heated in a furnace arranged similarly to an oven, so that the heat should be uniform. They

Digitized by Google

were exposed until they attained a heat of about 800 degrees Fahr., which was ascertained by withdrawing them and noting if small pieces of zinc would melt if placed upon them. They were then allowed to cool and the process repeated 3, 8, 12, 20, 40, and 60 times, as recorded in the table. The samples from which the tests shown in the eighth line were obtained were placed in the flue of a stationary boiler for sixteen days, care being taken to keep them clear of ashes, so that they received the heat from the boiler on their under sides, while their upper surfaces were exposed to the heat radiating through the fire-bars from the fire. Mr. Barnaby considers that the heat of these samples was often up to 800 degrees, and at other times was very much below that point. The determinations shown in the ninth line were obtained from samples suspended for sixteen days from a bar fitted in the smoke-box of a colliery locomotive. As the engine was subject to considerable variations of work, and was idle at night, the samples would be alternately heated and cooled. Experiments with various alloys showed the maximum temperature to be about 800 degrees Fahr. The last line gives the results of tests made on samples which had been placed under the bridge of an annealing furnace in such a position that the flames could not impinge upon them. They were kept in this situation for sixteen days, the furnace being allowed to cool down each evening, and being got up to the required heat again next morning, so that the samples were exposed to a black heat at night, and during the day time to a red heat, sufficient in the sixteen days to scale them to the extent of one eighth inch.

The results of the tests showed that Siemens steel retains all its good qualities, except after the very severe treatment of being subjected to long and continued red heat; that Bessemer steel suffers no deterioration except a slight falling off in its flexibility; that, even after being heated and cooled sixty times, it has only slightly increased in tensile strength, while it has maintained its percentage of elongation; and that, after the samples had been subjected to the continued red heat, the results obtained were most satisfactory, and greatly superior to those of iron; that the irons only deteriorated under a continuous red heat, under which circumstances they suffer much more than the steel.

After the samples had been broken in the testing-machine, they were bent by a hammer over a bending-block as far as they could go, and illustrations are appended to the report showing how far the process was carried before cracks were developed. As might be expected, the results were very uncertain; but on the whole, the Siemens steel came the best through the trial, after bending into horseshoe shape without the development of a flaw. The preliminary stretching appeared to have completely destroyed the flexibility of the iron, which cracked upon the slightest curvature.

THE RIO TINTO COMPANY.

The report of the directors, prepared for presentation at the forthcoming meeting, states that, unlike the accounts of the two previous years, those now submitted show no change in the capital account, except in respect to the 5 per cent bonds of 1880, which are further reduced by £33,220, the amount of the year's drawings. This amount has, as usual, been charged to the revenue account, and written off the cost of mines, which is thus reduced to £3,572,460. The profit on sales of produce and other items at the credit of revenue account, including £10,456 2s., brought down from the previous year, amount to £748,764 3s. 7d. After providing for all interest and expenses of administration, and the £33,220 amount of drawn bonds, there remains a net profit available for dividend of £477,183 16s. 4d., which the directors propose to appropriate thus: Interim dividend of 12s. per share, paid November, 1882, on 325,000 shares, £195,000; dividend now recommended to be paid, 16s. per share on 325,000 shares, £260,000, making together 28s. per share. or 14 per cent per annum = £445,000, and leaving a balance of £22,183 16s. 4d. to be carried forward in revenue account.

For the development of the property, 556,610 cubic meters of overburden on the south lode have been removed during 1882. Balance at debit of overburden account at end of 1882 was £196,624 7s. 9d. In both the San Dionisio and the North lode, the quantity of ore already laid open and prepared is such that the output can at any time be largely augmented. The tunnel to connect the north with the south lode is also steadily driven with the same object in view. The large masses of ore made available by the works already carried out will render any further heavy outlay unnecessary, whether on account of overburden of extensions and development-works, or of buildings, machinery, etc., and the charge which is regularly made upon the ore as extracted will steadily reduce the balance of overburden and of extension and development-works until they are finally liquidated.

The quantities of pyrites extracted were, in tons: In 1880, for shipment, 277,590; for extraction of copper by local treatment, 637,567= 915,157. In 1881, for shipment, 249,098; for extraction of copper by local treatment, 743,949=993,047. In 1882, for shipment, 259,924; for extraction of copper by local treatment, 688,307=948,231. The quality of the mineral is well maintained, and its average copper contents over the entire quantity have been 2·805 against 2·75 per cent for the previous year. The amount of the company's pyrites actually consumed in England, Germany, etc., during the year has been 272,826 tons, against 256,821 in 1881, and 274,201 in 1880. The copper produced during the year by treatment at the mines was estimated at 10,822 tons of 1000 kilos., and there were brought to market and realized 9651 tons of 21 cwts., leaving the balance to be carried forward to the current year at cost price. The comparatively small increase of production this year is entirely due to the exceptionally dry season, and, owing to the unprecedented scarcity of water, the expensive pumping back of used liquors has added to the cost of the copper to the extent of about 10 per cent. As regards water supply, it was reported last year that means had already been adopted to construct a large reservoir to contain about 2,500,000 tons of water. This reservoir is now nearly finished, and as rain began to fall in January of this year, it contains about two fifths of its full capacity—over 1,000,000 tons—available for 1883, besides the ordinary storage of water in the previously erected reservoirs of about the same quantity, which are now full. The railroad and pier have been maintained in good order, and are in full operation. All repairs and cost of maintenance have been charged to revenue.

THE VENTILATION OF COAL CARGOES.

Messrs. William Lindsay & Co., of Greenock, have addressed the following letter to the British Board of Trade:

"The question of spontaneous combustion of coal cargoes on long voyages is of such vital importance to ship-owners and underwriters, and has received so much attention from your board, that the following information, which we have to-day received from the captain of our bark Inchgreen, concerning his experience on a voyage from Dundee to San Francisco with a coal cargo, is our excuse for troubling you with a long letter. The Inchgreen sailed from Dundee on the evening of the 22d April, 1881, with 1509 tons of Watson's splint coal on board for cargo. These were shipped during fine weather, and, so far as we can remember, were perfectly dry when being loaded. The vessel has got two decks, between decks being laid, with the exception of a middle space of three feet, running right fore and aft, for which there are hatches, but with coal cargoes these are not put on. With this particular cargo, the coals were about two feet from the main deck from the after-hatch to the fore-hatch, sloping down at both ends, leaving a free space of about forty feet aft, and about the same forward on the between decks. The ship is very well ventilated, having two bell-mouth ventilators on the forecastle, the forward one 7 inches diameter at deck and 14 inches at bell-mouth, the after 9½ inches diameter at deck and 16½ inches at bell-mouth, ventilating both lower holds and between decks; a ventilator of 11 feet by 9 inches through the house on deck between the fore and main hatches for the between decks only; another, 3 feet square, ventilating lower holds and between decks abaft the mainmast; another, 2½ feet square, ventilating between decks about twelve feet from the after collision bulkhead. With ordinary cargoes, such as sugar, etc., the forward and after ventilators alone are used, and so well has the ventilation been arranged that, with a cargo of low Manila sugar, it was impossible to detect that there was sugar on board from the smell on the vessel's arrival in London; and at present, with a cargo of Java sugar, there is not the slightest appearance of sweat or discoloration on any of the baskets so far as can be seen, thus showing the thorough efficiency of the ventilation. On the 12th of May, after being three weeks out from Dundee, in latitude 36° 14′ N., longitude 19° W., Captain Miller discovered that the coals were heating, and that there was a dense vapor rising from them, which the ventilation then in use did not seem capable of carrying off. He caused a passage to be dug from the main hatch forward, and, with the view of improving the ventilation, cut a circular opening in one of the fore-hatches, into which he shifted one of the forward ventilators, erecting a small windmill at its mouth, he believing this would draw off the vapor and heated gases much more rapidly than by the ordinary action of the ventilators. The coals at this time had become so heated that it was almost impossible to stand on them, and Captain Miller was very apprehensive of the safety of his ship. Soon after the application of the windmill, an improvement was observed, which daily continued, until at the end of three weeks there was no sign of heat in the holds, the coals continuing cool until the termination of the voyage at San Francisco on the 2d of October, one hundred and sixty-two days from Dundee. At that particular time, nearly all the ships sailing from Dundee and arriving at San Francisco were more or less affected by fire in their cargoes. So far as we at present know, the Dunottar Castle, Caitlock, and Traveler had their cargoes on fire, and the British Sovereign, which succeeded the Inchgreen at the coal-crane, has never been heard of. We think it probable that the Inchgreen's immunity from fire is owing to the simple contrivance arranged by Captain Miller, and we bring the matter before you with the desire of its being made known to ship-owners and ship-masters loading similar cargoes.

THE CONDITION IN WHICH CARBON EXISTS IN STEEL.

Two series of experiments have been made recently by Sir F. A. Abel and W. H. Deering, the results of which have just been published. In the first series, disks of steel 2·5 inches in diameter and 0·01 inch thick were employed. They were all cut from the same strip of metal, but some were "cold-rolled," some "annealed," and some "hardened." The total carbon was found to be, "cold-rolled," 1·108 per cent; hardened, 1·128 per cent; and annealed, 0·924 and 0·860 per cent. Some of the disks were submitted to the action of an oxidizing solution consisting of a cold saturated solution of potassium bichromate with 5 per cent by volume of pure concentrated sulphuric acid. In all cases, a blackish magnetic residue was left undissolved. These residues, calculated upon 100 parts of the disks employed, had the following compositions: "Cold-rolled" carbon, 1·039 per cent; iron, 5·871. Annealed, carbon, 0·83 per cent; iron, 4·74 per cent. Hardened, carbon, 0·178 per cent; iron, 0·70 per cent. So that by treatment with chromic acid in the cold, nearly the whole of the carbon remains undissolved with the cold-rolled and annealed disks, but only about one sixth of the total carbon is left undissolved in the case of the hardened disk. The authors then give a *résumé* of previous work on the subject. In the second part, they have investigated the action of bichromate solutions of various strengths on thin sheet-steel, about 0·008 inch thick, which was cold-rolled, and contained—Carbon, 1·144 per cent; silica, 0·166 per cent; manganese, 0·104 per cent. Four solutions were used The first contained about 10 per cent of bichromate, and 9 per cent of sulphuric acid by weight; the second was eight tenths as strong, the third about half as strong, the fourth about one and a half times as strong. In all cases, the amount of solution employed was considerably in excess of the amount required to dissolve the steel used. A residue was obtained as before. With solution 1, the residue contained, carbon, 1·021; solution 2, carbon, 0·969; solution 3, carbon, 1·049 (the atomic ratio of iron to carbon was iron, 2·694 : carbon, 1; iron, 2·65 : carbon, 1; iron, 2·867 : carbon 1); solution 4, carbon, 0·266 per 100 of steel. The authors conclude that the carbon in cold-rolled steel exists not simply diffused mechanically through the mass of steel, but in the form of an iron carbide, Fe_3C, a definite product, capable of resisting the action of an oxidizing solution (if the latter is not too strong), which exerts a rapid solvent action upon the iron through which the carbide is distributed.

THE HENDERSON GAS-FURNACE.

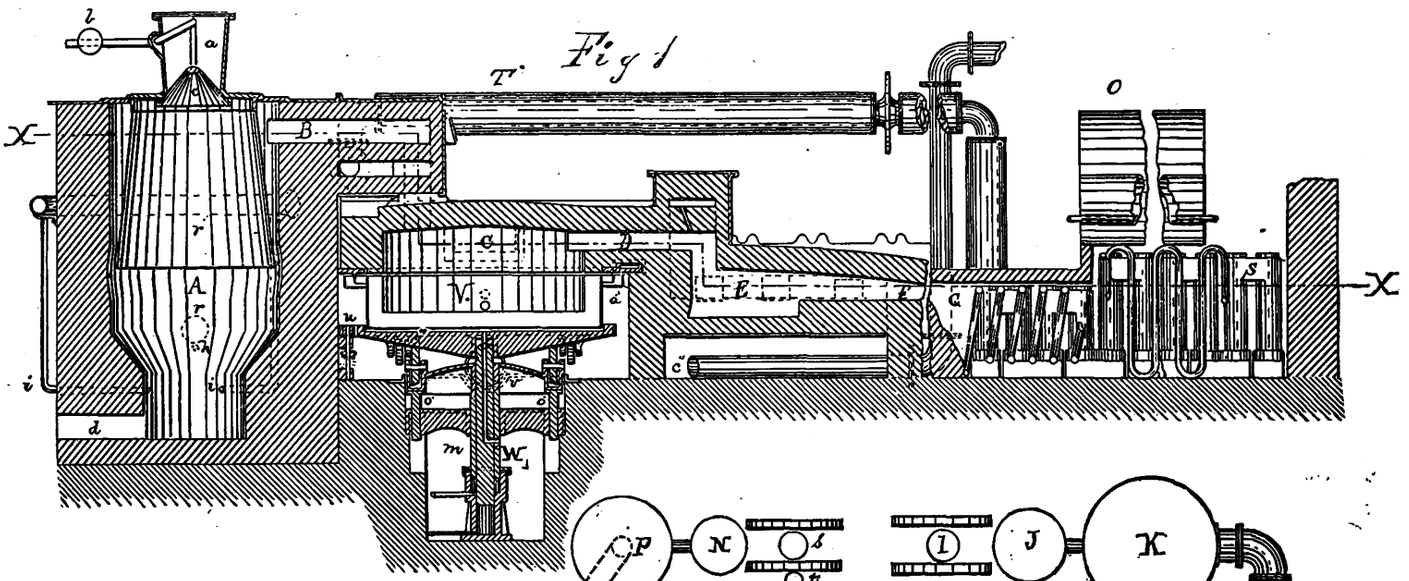
After years of study, Mr. James Henderson has designed a gas-furnace for metallurgical purposes which combines a number of details looking toward as complete a utilization of the fuel as possible, together with the rapid generation of the highest heats practically required. The principle which appears to have guided him is, that the supply of air for the generation of the gas in the producer and the quantity needed for its combustion—partial or complete as the requirements of the process may be—can only be supplied with the needed accuracy by separate engines.

In the plan of the drawing which we give this week, the air for converting the fuel in the producer *A* into gas is furnished by an engine—a vertical fly-wheel engine in this case—with a steam cylinder *s*, and an air cylinder *N*. In order to make the flow of air more regular, a receiver *P* is provided, from which it is carried to the blast-pipe of the producer, being distributed into the furnace by the tuyeres *i*. The coal is charged into the safety-hopper *a*, and falls into the upper part of the producer *r'*, provided with a boiler-iron skirt, serving as a retort in which the bituminous substances of the coal are partly distilled off and forced to pass downward into the current of gas. The aim of Mr. Henderson is to produce a gas containing one third by volume of hydrogen, and two thirds by volume of carbonic oxide, and he introduces steam whenever it is necessary to effect that end. Mr. Henderson has adopted the plan of removing the ash and clinker in the coal by fluxing it and tapping the cinder through *d*, the fluxes being so chosen that the cinder carries three parts of silica to two parts of lime and one part of alumina; and to effect this, varying quantities of lime are generally added. We are informed that this plan has worked very well at the experimental plant put up at Bellefonte, Pa. It will be noticed that, in accordance with modern practice, Mr. Henderson places his producer in close proximity to his furnace, thus avoiding any loss of heat by radiation in long flues. Flowing through the flue *B*, the gas passes downward at its end and mixes thoroughly with the preheated air, discharged, through the pipe *T*, through a large number of small holes in a direction at right angles to the direction of the current of gas. Thus thoroughly mixed, the burning gases enter the reverberatory chamber *C*, impinging upon the metal in the hearth *V*. The air for the combustion of the gas is furnished in the exact quantity needed by the blowing-engine *I J*. It passes through the regulating receiver *K*, the pipe *L*, into the hot-blast pipes *S*, placed under the boiler *O*, where the waste heat of the gases of combustion is utilized. To prevent radiation of heat, the blast-pipe *T*, conveying it to the point where it is to be burned, is well covered with non-conducting material, and an expansion-joint is also provided. The melter has it in his power to obtain a neutral, oxidizing, or reducing flame by regulating the quantity of air to be mixed with the gas. In the case of the two former methods of working, the gases of combustion leave the reverberatory chamber *C* through the flue *D*, and this heat is first utilized to preheat materials to be melted on the hearth *E*. The heat of the waste gases is further reduced by heating the air in the pipes *S*, and making steam in the boiler *O*. In case a reducing flame is required in the reverberatory chamber, the combustion of the gas has been only partial. In order to fully utilize it, Mr. Henderson diverts the excess of air for combustion not passed through *T*, into the pipe *c''* under the hearth of the preheating chamber *E*, carrying it upward in flues along the free side-wall of the hearth, to be further heated, and making it flow through the slanting holes in the roof at the end of the flue *D* into the current of unconsumed gases coming from the reverberatory chamber *C*.

The hearth itself is mounted on a rotary platform which can be raised into position by hydraulic power. A sand-box is used for sealing the joint. The hearth makes from 3 to 4 revolutions per minute. By lowering the platform, two wheels, with which it is provided, rest on a track over which it can be drawn out sideways.

The furnace we have described has been experimented with at Bellefonte, the capacity of the hearth being 2½ tons. It was principally built to test its performance compared with the Siemens regenerative furnace, the lack of proper handling appliances making it impossible to enter into any regular work in melting and casting steel. The furnace, of course, is capable of being enlarged to the dimensions given to modern open-hearth furnaces.

Fig 1



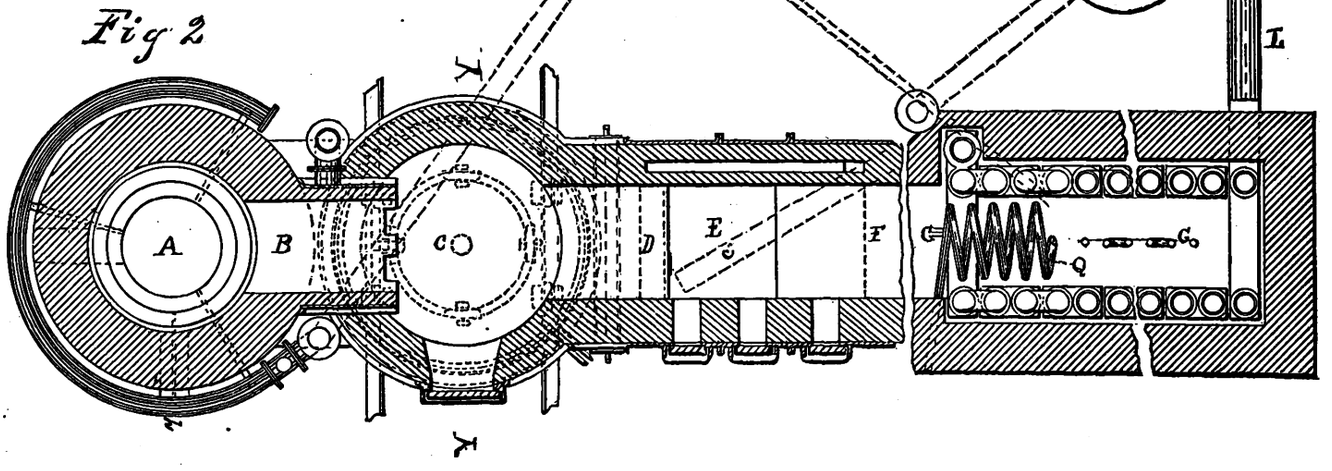


Fig 2

THE HENDERSON GAS-FURNACE.

Mr. Jonathan Jinks, steel-melter of the St. Albans Steel-Works, St. Albans, Vt., gives the following record of an operation of the Henderson direct-acting furnace:

MAY 1ST,	1	P.M.—Furnace lighted, using one sixth of a cord of wood.
	4	P.M.—Blast put on. The furnace was heated with coke for 12 hours during the night, to keep the producer hot and enable the men to rest.
MAY 2D,	4	A.M.—Furnace charged with gas-coal.
	8	A.M.—Furnace hot.
	12	M.—Began making bottom.
	12	P.M.—Bottom made. Furnace idle 4½ hours.
MAY 3D,	4.30	A.M.—Charged metal.
	9	A.M.—Tapped out the heat.

This makes a total of 44 hours, from which 16 hours must be deducted, leaving the actual working 28 hours. Comparing this with the Siemens furnace, we have: The latter requires one day's heating with wood fire at

Digitized by Google

the start, with a consumption of from 3 to 4 cords of wood. It takes 48 hours before it is hot with gas and from 2 to 3 days more to make a sand bottom. Working a charge of half pig and half scrap-iron is completed in from 11 to 12 hours, to produce as low a carbon steel as that made with the Henderson furnace. In the latter, the charge referred to was: 1000 pounds No. 2 Bessemer pig, 600 pounds of steel scrap from the former heat, 300 pounds of wrought scrap, 30 pounds of ferro-manganese, and 220 pounds of Lake Superior iron ore. Mr. Jinks estimates the waste at 6 per cent. It is claimed that the repairs to the Henderson furnace will not be more than those of an ordinary puddling-furnace, the principal parts, the inlet and outlet of the flue, being readily accessible. Mr. Henderson's furnace, which has been patented, is certainly well designed, and the fuel consumption, as shown thus far, 3 cwts. per hour for the 2½-ton furnace, is low.

THE SIEMENS REGENERATIVE FURNACE PATENT.

Judge Butler, in the United States Court in Philadelphia, has filed an important opinion, in which he dismissed a bill in equity of Charles M. and Frederick Siemens against the directors of the Midvale Steel Company, claiming a royalty upon the use of the Siemens regenerative gas-furnace from 1878 to 1881. The Midvale Company contended that the patent expired in 1878, and refused to pay any penalties after that date. The patentees claim that their rights did not expire until 1881, and demanded a royalty for the three years. A number of manufacturers paid the royalty. The Midvale Company contended that the furnace having been patented in England in 1861, the English patent limited the duration of the American patent under an act of 1839, as amended by an act of 1861, to seventeen years, to July 22d, 1878. The complainants contended that their patent, which was of March 1st, 1864, and on its face was for seventeen years from that date, was not limited by the English patent, because the improvements patented here were substantially different from those described and shown in the English patent, and because, even if it were otherwise, the act of 1861 gave all patents thereafter issued a term of seventeen years from their date of issue. The American patent, it was consequently contended, did not expire until March 1st, 1881. Judge Butler, in the course of his opinion, said: "The language of the act of 1861, that all patents hereafter granted shall remain in force for seventeen years from the date of issue, considered in connection with former and existing legislation respecting inventions first patented abroad, was well calculated to create the doubt and embarrassment which have followed. In the absence of decisions by other courts, I believe I would have reached the conclusion that the language first quoted was intended simply to increase the duration of all patents thereafter issued equally, giving to each an additional period of three years without interfering with the distinction so long maintained between inventions originally patented here and those patented abroad. The question, however, having been fully considered by Judge Blatchford in a case requiring his decision, I am content to adopt his views. The reasons on which he rests his conclusions commend themselves to my judgment."

SAMPLING AND ANALYZING ORES AND CHEMICAL PRODUCTS.

Prof. George Lunge, of the Zurich Polytechnic School, has sent out the following letter, the contents of which, though applying more directly to the chemical industries, touch questions which have long agitated those engaged in various branches of mining and metallurgy:

The committee of the German Society for the Promotion of Chemical Industry has resolved, upon a suggestion made by the representative of the chemical manure manufacturers, to submit to the next general meeting of the society the following proposal, namely:

"That steps may be taken for bringing about an international agreement concerning uniform analytical methods for estimating the commercial value of certain products."

I have been honored with the request to lay a report upon this matter before the meeting, and for this purpose I take the liberty of addressing myself to you, to obtain the favor of your opinion thereon.

It will not be doubted that the confusion at present reigning in that matter is very awkward indeed. In the transactions between manufacturers and their buyers and sellers, unpleasant discussions or even lawsuits are frequently caused by the employment of different methods of sampling or testing, or both—methods which must needs lead to differing results; and an appeal to a commercial analyst sometimes increases the confusion by the introduction of a third method. This would be avoided if all those concerned were agreed upon employing certain standards for sampling and testing the goods, the same specific gravity tables, and so orth.

It is, moreover, most desirable that the results of analysis should be expressed in a uniform manner. Mutual understanding is greatly impeded if, for instance, one party calculates phosphoric acid as such, the second as tricalcic phosphate, the third perhaps as monocalcic phosphate. The strength of soda-ash is expressed in a different way each in England, France, and Germany, and many other similar instances might be quoted. Not merely for commercial purposes, but also for comparing results of work, it would be most desirable to establish some such agreement. An English acid-maker, who learns that his German neighbor consumes so much nitric acid at 36° Baumé for each cwt. of sulphuric acid, has no notion what that may mean in terms of 96 per cent nitrate of soda per 100 parts of sulphur, etc., etc.

A considerable number of the German chemical manufacturers has taken steps for improving this state of affairs, at least within their own country. The chemical manure makers have agreed upon uniform and binding modes of testing, and the alkali trade is aiming at the same object by means of a *Manual for Alkali, Potash, and Ammonia-Works*, just published. The success already attained in this direction in Germany has been an encouragement to conceive the idea that the great advantage of uniform methods might be extended internationally, and it is just the object of the present communication to gather information about the possibility of realizing this.

Nobody, of course, will overlook the difficulties standing in the way of such an agreement. Some of the countries concerned do not even possess suitably organized unions of chemical manufacturers, and international unions of such a character are altogether out of the question. Even if such existed, they would never succeed in *compelling* their members to employ certain methods, or even the same way of expressing the results, and still less would they be able to exert such a compulsion upon the buying and selling public and the commercial analysts. Nor can it be denied that great differences of opinion exist as to the value of many analytical methods, and that constantly new, if not always better, methods come to the fore. Hence a rigid compulsory code, binding forever, or even for a long period, is not to be thought of. But, on the other hand, those go too far who for this reason deny the possibility, or even the desirability, of an agreement in this respect. Even in public matters no law can be made which embodies absolute truth and justice; in the long run, with changing circumstances, the best laws become unsuitable, and must be changed; but nobody pretends that therefore we must do without laws altogether. Without laying too much stress upon this simile, it will be conceded that an agreement among the leading manufacturers and chemists of the great industrial countries upon the matters concerned, even though it would not either possess or claim absolute binding power, would be invested with sufficient authority to serve, in a large majority of cases, as a standard in the intercourse between buyers and sellers. It would soon become a regular practice to stipulate for those standards in contracts and sale notes, and they would be acknowledged as decisive in courts of law.

With this view, I beg to lay the following questions before you, in the respectful hope of receiving as full an answer as possible, to be made use of, either with mention of name or otherwise, as you may wish, in my report to the meeting of German chemical manufacturers:

1. Do you believe that an international agreement concerning exact standards of *sampling* ores, raw products, and chemicals could be attained?

2. Do you believe that a similar agreement could be attained in the matter of *analytic methods*, and more particularly in which definite branches of industry?

3. Do you believe that in some definite branches of chemical industry a uniform international *way of expressing the results* could be agreed upon, and have you any specific proposals to make in this respect?

4. In case you should answer one or more of the above questions in the affirmative, what *organs* would you think suitable for establishing an international agreement?

5. Do you think that such agreements should be made for an indefinite time, or that their *revision*, evidently called for from time to time, should be from the first provided for by a periodical action of the just-mentioned organs?

6. In what *form* do you think that the results of such an agreement should be made accessible to the public?

Whatever your opinion may be upon these points, I shall consider it a special favor if you will impart it to me at your convenience, in order to make use of it in my official report.

A ROAD OF SILVER.—The following tall story is going the rounds, and is gravely printed: In Clinton County, N. Y., Peter Trembly, of the Trembly Iron Company, in making roads, has been using cinders resulting from the ore passing through the heat of the forge. It has been noticed that a road covered with these cinders has been glittering. An investigation showed that a rich vein of silver had been struck in the iron mine, and the precious metal melting in the forge had run through upon the cinders that had been so freely distributed along the road. Mr. Trembly gathered up his cinders, deciding not to have a road of silver in this world.

FURNACE, MILL, AND FACTORY.

Mr. A. T. Chur, agent of the Abernant Dinas fire-brick and cement, has removed to the Mills Building, Room 14.

The Graydon & Denton Manufacturing Company has opened an office for the sale of its Dynamic rock-drill at No. 1 Park Place, in this city.

Dr. Edwin Fowler, President, and Professor Theodore Stahl, General Manager, of the Southern Colorado Bismuth and Silver Mining and Smelting Company, of Silverton, Colorado, have placed their order with the Fort Scott Foundry and Machine-Works for the erection of a concentrator at their mines, of sixty tons capacity per day.

The No. 1 stack of the Saucon Iron-Works, at Hellertown, Pa., has been blown out for repairs. It is likely the furnace will remain out of operation until there is a larger demand for iron, and a consequent increase in its value.

In going over a pamphlet issued by the John Ashcroft Manufacturing Company, of this city, we came across the following figures relating to competitive tests made with ordinary boiler furnaces and with furnaces provided with the Ashcroft furnace-door and grate-bars. At the Manchester Print-Works, an ordinary furnace, during a trial-run of thirty-six hours, consuming Lackawanna anthracite, the evaporation of water from 212 degrees Fahr. was 10·97 pounds per pound of coal, while with the same fuel and the same type of furnace, fitted with the appliances referred to, the evaporation was 11·90 pounds, a gain of 8·47 per cent, while the amount of clinker taken out was considerably less than in the first case. Another test, carried out at the works of the Troy Steam Heating Company, showed a gain of 5·52 per cent in efficiency.

Uniform steam pressure being a necessity in the production of a perfect electric light, the Edison Light Company, of New York, has secured it by the use of the Curtis pressure regulator. The company uses 5-inch regulators on its large engines.

P. J. Dalton, of Latrobe, Westmoreland County, Pa., has closed a contract for the building of twenty coke-ovens at Clarksburg, West Va. They are for the Despard Coal and Coke Company, of Baltimore.

The Crozer Steel-Works, at Roanoke, Va., are nearly ready for work.

The Sarven Wheel Works, at Indianapolis, will soon be completed. Messrs. Hadley & Wright are furnishing the boilers and engine and are now turning up the large belt-wheel, 14 feet in diameter and 24 inches face, said to be the largest wheel of the kind ever made in Indianapolis.

The Reading *Herald* says: The Harrisburg Nail-Works have been experimenting in the manufacture of nails from steel, and have succeeded in producing a fine article. The nails are manufactured from steel made at the Pennsylvania Steel-Works, the quality the same used in making rails; the nails are pronounced

Digitized by Google

to be superior in quality to the iron nail. They are nicely finished ; and drive into the hardest of wood without bending.

Shawnee furnace, No. 2, at Columbia, Pa., is about to be closed for the present, on account of the limited demand for iron. Work will be resumed on the revival of business. The employés will not be discharged, but will be engaged in making repairs about the furnace.

The project of building a steel plate mill at Wheeling, West Va., for the common use of the nail mills there, is said to have fallen through.

Every portion of the Allentown, Pa., Rolling-Mill Company's Works has been closed, and work has also been suspended at the fire-brick works of Messrs. Ritter & Saylor, in that city.

At the Wando Phosphate Works, Charleston, S. C., the centrifugal mill of the Lucop & Cook Pulverizer Company, size D, has been running with marked success for several months upon the Charleston River rock. The product obtained is one ton per hour of fine powder, more uniform than the ordinary buhr-stone yield, and commanding a ready sale in preference to it. Woodward & Thiers, the well-known brokerage firm of Philadelphia, Pa., recently ordered from the Wando Phosphate Company three thousand tons of the centrifugal mill product, which is supplied as rapidly as possible, the Wando Works having ordered two more D mills, in addition to the one already running. The Lucop & Cook Company is also building mills to fill orders from the Atlantic and Ashepoo companies of Charleston, the Bradley Fertilizer Company of Boston, and others ; and the general introduction of its mill in place of the present cumbrous and expensive methods of buhr-stone grinding seems probable, as the power required by its centrifugal mill does not exceed eight horse, and it is prepared to guarantee that the cost of wear and tear and replacement of working parts will not exceed eight cents per ton of material pulverized.

The Grace furnace, Marquette, is to be put in blast in the near future, by a stock company, of which Sturges, Kruse & Travers, Chicago, are the prime movers. It is said that the money sufficient to put the property in shape is now ready, and that the work of improvement will be commenced at once. This will be a benefit of some little value to the district.

The Lechner Machine Company, of Columbus, O., is building a coal elevator at Straitsville, for the Columbus & Hocking Coal and Iron Company.

MINERAL PATENTS GRANTED BY THE UNITED STATES LAND-OFFICE.

The following patents bear date May 15th, 1883 :

ARIZONA.

TUCSON DISTRICT.

Woronoco Mining Company, San Diego lode. Lemuel J. Webster, Rescue and Champion lodes. Ferre Mining Company, Bee lode. Peter Whitman *et al.*, Silver Queen lode.

CALIFORNIA.

LOS ANGELES DISTRICT.

Seth Marshall, Jr., Rio Vista and Painsville lodes.

MARYSVILLE DISTRICT.

H. F. L. Strover *et al.*, Goods Flat quartz mine. Eben McKenney, Mountain placer mine. Alure Kerrigan *et al.*, Eastern Star placer. Red Hill Hydraulic Mining and Water Company, placer, Butte County.

SACRAMENTO DISTRICT.

William Irelan, Sr., Yuba and Arabian quartz mines. Frederick Safried, Yuba Extension quartz mine. C. E. Purington *et al.*, Golden Gem placer, Placer County. Lorenzo Herrick *et al.*, placer, El Dorado County.

COLORADO.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY.

Experts for the Copper Queen and Copper Prince mines have arrived, and the case will come up in the District Court in a few days.

TOMBSTONE DISTRICT.

BONANZA.—The mine, it is stated, has been bonded to Chicago parties for $20,000.

GRAND CENTRAL.—The pumps have been stopped for the present, and will remain idle until the Contention pumps are ready for work, when both companies will resume sinking below the water-level. It is expected that the delay will not exceed sixty days.

OLD GUARD.—Work has been resumed, and ten tons of ore are extracted daily. The milling ore is sent to the Randolph mill, and the smelting ore to the San Diego smelter.

PROMPTER.—A rich body of ore has been struck in the No. 5 shaft. The entire face of the shaft is in bromide ore.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

There is nothing new to report from the mines in this district. The production and work of development continue as usual.

PLUMAS COUNTY—GREENVILLE DISTRICT.

ARCADIAN.—A clean-up was made at the mill, and the bullion obtained left a profit of one hundred per cent on the total expenses of the mine and mill during twenty-five days' run. In this are included wages, timbering, mine supplies, liberal estimate for wear and tear of machinery, and the cost of water-power. All the ore milled on this run was taken from the upper tunnel in the Sunset ledge ; the stope on this ledge is now open 125 feet, and the vein runs from five to eight feet wide. The ore is low grade, but is soft and easily worked. Twenty tons are produced daily. Six hundred feet distant from where the above ore was taken and at a farther depth of 200 feet, another pay-chimney is open on the same ledge. This mine has only lately been opened, but the prospect thus far gives warrant to the belief that it will turn out to be a valuable property.

GOLD STRIPE.—The agent of this company, who now has charge of its affairs at Greenville, says the *Bulletin*, expects to be able in a few days to make a proposition to parties who have claims against the property to offer fifty cents on the dollar, in liquidation of the same.

INDIAN VALLEY.—This mine is now at a greater depth than any other in the district ; the shaft is six hundred and five feet deep, the entire distance being sunk on the ledge, and from top to bottom the ledge is less than two feet out of perpendicular. The ore is low-grade, and, being so hard, is expensive to work ; a fair profit is made ; but to secure this, the closest attention and most careful management are necessary in both mine and mill. In the mill, nearly all the rock has to be put through a rock-breaker before going to the batteries. Every precaution is taken to save the gold, which is very fine and difficult to catch.

CANADA.

PROVINCE OF MANITOBA.

HAY ISLAND.—This company has perfected arrangements for the active prosecution of the development of its claim, which is a continuation of the now well-known Keewatin. The sinking of a shaft has begun.

KEEWATIN.—Work is progressing very satisfactorily. Good ore was struck in the shaft recently. Some of this ore will be crushed and concentrated and shipped East for treatment.

ISABELLA.—Operations are active, and negotiations for the purchase of machinery are pending.

LAKE WINNIPEG.—Cross-cutting has been commenced, and the ore shows up well. Operations on a working-shaft will begin shortly. It will be started about 100 feet north of the trial-shaft.

WINNIPEG CONSOLIDATED.—The bullion produced shows $25.83 per ton saved, and the tailings a value of $16.61 per ton, giving a total of $42.44.

There is considerable activity in the phosphate regions of Canada. On the disappearance of the snow, numerous prospectors took the field, and new developments and discoveries are chronicled every day. The Cobden District is exciting the greatest amount of attention. Pan analysis made by Messrs. Ledoux & Ricketts of apatite, taken from a property worked by Messrs. Benedict & Cole, of New York, showed 89 per cent bone phosphate.

THUNDER BAY DISTRICT.

In Thunder Bay District, North Shore, Lake Superior, operations are carried on to a considerable extent, and several new companies have been formed for the purpose of working recent discoveries made in the district. The Jack Fish Lake mine promises to be one of the leading gold and silver producers. Prospecting will be carried on this summer to a greater extent than ever before.

WINNEPEG.

The assays of ore from the Canada Gold Mining Company's claim at Lake of the Woods are reported at $30 of gold per ton. Work is vigorously pushed forward at this and the Winnepeg Consolidated Company's two mines, between which it is situated. Mining claims are rapidly picked up in this vicinity.

Mr. Dobie has bought the Pine Portage mine for a sum said to be near $100,000. He is also bound to erect a ten-stamp mill.

At the Keewatin mine, three shifts have been employed for some time back, and sinking is proceeding in a satisfactory manner. The vein has not increased materially in width, nor is it at all likely to increase much before the lake level is reached. The shaft is down over sixty feet.

At the George Heenan mine, Superintendent Nagle is pushing work rapidly but substantially forward. He has lately made some valuable discoveries on the property. Three new veins have been found, not the most valuable of which is the uncovering of the Frenchman lead near where the present shaft is located, and where it had been industriously sought for years, but had eluded search. From what has been discovered, astonishing developments may confidently be expected in the next few months.

Arrangements have been made for the development of the Minnesaubie vein, on the lake, the property of Messrs. Rideout and Gibbons. Two shafts are sinking, each to be 7 by 10, 25 feet deep. The contract price for sinking is $28 per foot.

Mr. William Young, Superintendent of the International Mining Company, says work is progressing favorably at the Maiden location, although but a small staff is operating at present. The shaft is down some 18 feet. As soon as navigation opens, a double shaft will be put on, and the Climax, another valuable property belonging to the same company, will be opened.

COLORADO.

The following companies have filed articles of incorporation :

Bridal Veil Mining Company. Capital stock, $2,500,000. Directors : M. D Monsor, William H. Durham, and Samuel H. Gregg. Operations, Colorado

Digitized by Google

Principal office, Crawfordsville, Ind. Brittle Silver Mining Company. Capital stock, $200,000; shares, $10 each. Directors: George McGinley, H. M. Trueheart, Louis Wilbur, J. J. Hunter, and John Summers. Operations, Colorado. Offices at Galveston, Texas, and Silver Cliff, Colo. Buckeye State Mining Company. Capital stock, $1,000,000. Directors: Judge C. M. Hughes, W. B. Simons, R. Jones, and D. J. Roap. Bullion Prince Mining and Smelting Company. Capital stock increased to $600,000, and name changed to the Bullion Prince Mining Company. Bunker Hill Gold and Silver Mining Company. Capital stock, $1,000,000; shares, $10 each. Directors: E. H. O'Neall, W. T. Bensel, B. R. Russell, W. R. Risting, J. Q. W. Wilhite, T. H. B. McCain, and Charles A. Miller. Operations, Gunnison County, Colo. Principal office in said county, and branch office at Crawfordsville, Ind. Chicago & Kansas City Mining Company. Capital stock, $1,000,000; shares, $10 each. Directors: George W. Jones, W. Small, J. H. B. Beckford, F. Howard, and E. P. Hatch. Operations, Chaffee County, Colo. Office, Maysville, Colo. Clayton Mining Company. Capital stock, $500,000; shares, $10 each. Directors: Clayton French and David T. Burr, of Philadelphia, and Charles Buckland, of Montezuma, Colo. Operations, Summit County, Colo. Principal office, Montezuma, and branch office, Philadelphia, Pa. Columbus Mining Company. Capital stock, $3,000,000; shares, $10 each. Principal office, Columbus, Colo. Congress Copper Mining Company. Principal office, Silverton, Colo. Cosmos Mining Company. Capital stock, $3,000,000; shares, $10 each. Directors: Carl Wulsten, Edward Chiles, S. D. Hayward, and two others to be hereafter elected. Operations, Colorado. Principal office, Denver; branch office, Rosita, Colo. Denver Gold Company, Limited. Capital stock, £60,000; 240,000 shares. Directors: Francis Frederick Powell, Charles Henry Dunhill, Alfred Marshall, and Jay and Philip Bennett Marshall. Operations, Gilpin County, Colo. Office, Nevada, Colo. Enterprise Mine Developing and Milling Company. Capital stock, $15,000. The purpose of the company is to develop mines and to operate mills for the reduction of ores, take leases on mining property and mills, to acquire by purchase, lease, entry, grant, devise, gift, or otherwise, real estate or other property, etc. Directors: S. S. Griswold, J. G. Brown, H. M. Johnson, A. B. McGill, and F. E. Bushby. Fountain Mining Company. Capital stock, $1,000,000. Directors: S. H. Appel, President; I. N. Zeang, Robert Colton, John F. Miller, T. O. Batch, George H. Allen, George Rousberger, Harry Palmer, and George Brandel. Operations, Colorado. The principal office will be at Bellefontaine, Ohio, with a branch office at Salida, Colo. Goldfinch Mining Company. Capital stock, $300,000. Directors: Louis D. Oviatt, Henry W. Preston, Abraham Clawson, George T. Dell, and Lewis H. Dickson. Office, Longmont, Colo. Grand Duke Mining Company. Capital stock, $800,000; shares, $10 each. Directors: John C. H. D. Block, Henry L. Rozier, Gustavus St. Gem, Edward A. Rozier, and Joseph Meredith. Operations, Colorado. Principal office, St. Louis, Mo., with a branch office at Rico, Colo. Grant & Sherman Mining Company. Capital stock, $30,000. Operations, Chaffee County, Colo. King Mining Company. Capital stock, $400,000; shares, $5 each. Directors: Joseph K. Baker, President; Clarence F. Whitaker, Secretary; Stephen C. Perry, Daniel T. Copeland, and Thomas Appleton Operations, Colorado. Principal office, Portland, Me. Leadville & Aztec Mining Company. Capital stock, $500,000. Directors: Theodore Dugalshe, Simeon Dunbar, and William Laild. Mint Mining Company. Capital, $175,000; shares, $50 each. Directors: Relief Jackson, James K. Pattison, John Levering, William Wallace, H. W. Moore, Joseph S. Hanna, A. W. Abbott, Dr. J. M. Smith, William H. Keller, James S. Warwick, all of Lafayette, Ind.; and James M. Harris, of Georgetown, Colo. Operations, Clear Creek County, Colo. Principal office, Lafayette, Ind. Nestor Mining Company. Capital stock, $1,000,000. Operations, Park County, Colo. New York & Colorado Mining Syndicate and Company. Increase of capital stock from $100,000 to $200,000; shares, $100 each. Principal office, Denver, Colo. Pacific Mining Company Capital stock, $100,000. Directors: Eli Punston, William Stockston, S. P. Weller, R. J. McConnell, Benjamin Ives, J. Piccioli, and W. Smith. Operations, Garfield County, Colo. Principal office, Denver, Colo. Palmer Group Mining Company. Capital stock, $1,000,000. Park County Sampling and Concentrating Company. Capital, $32,000; shares, $100 each. Directors: Hon. T. M. Patterson, H. Butler, Cecil C. Morgan, William M. Clarke, and Felix Leavick. The officers are: Hon. T. M. Patterson, President; H. Butler, Secretary; Cecil C. Morgan, Manager; William M. Clarke, Superintendent of Works. Operations, Park County, Colo. The principal offices are at Denver, with a branch at London Junction, Park Co., Colo. Royal Gorge Smelting Company. Capital stock, $50,000; shares, $50 each. Directors: A. R. Gumaer, W. R. Harp, and J. W. Taylor. Operations, Fremont County, Colo. Principal office, Cañon City, Colo. Rustler Mining Company. Capital stock, $75,000. Directors: John W. Blades, Jeff Harper, William O. Parker, and William Brown, of Chaffee County, and John O. Fry, of Ringgold County, Iowa. Operations, Chaffee County, Colo. Snow Mass Mining and Milling Company. Capital stock, $150,000; shares, $10 each. Directors: James L. Peck, John S. Blankman, George H. Pays, and Henry T. Spring. Operations, Gunnison County, Colo. Principal office, Denver, Colo. Sterling Mining Company. Capital stock, $100,000; shares, $1 each. Directors: Oscar G. Roedel, Hiram A. Johnson, Jesse V. A. Craighead, Heinrich Hemmerling, and Reinhard T. Nicgold. Operations, San Juan County, Colo. Principal office, New York City, with a branch office at Mcgoldstown, Colo. St. Louis Syndicate Mining Company. Capital stock, $2,000,000. Directors: John F. Watkins, William A. Adams, and E. L. Davis. Union Reduction-Works. Capital stock, $50,000. Incorporators: William K. Burchinell, P. J. Cunningham, George W. Bittinger, E. A. Gilbault, Matthew Moynahan, William Walsh, and Christopher E. Bloome. Operations, Chaffee, Lake, and Pitkin counties, Colo. United Silver Mining Company. Capital stock, $1,000,000; shares, $10 each. Directors: John A. Reid, John T. Sheaver, and Martin Johnson. Operations, Saguache County, Colo. Principal office, Chicago, Ill. Ute Pass Mining Company. Capital stock, $1,000,000. Directors: James Hadley, George O. Willard, Charles A. Hunt, Leander W. Jones, and William Hamilton. Operations, Colorado. Principal office, Salida, Colo. Warrior Mining Company. Capital stock, $300,000. Directors: C. W. Burke, Samuel Batchelor, and J. M. Fitzpatrick. Principal office, Cincinnati, Ohio.

BOULDER COUNTY.

Among the mines now worked in the vicinity of Boulder are the Senator Hill, Little Pittsburg, Lamon, Alice Fay, Eclipse, Reliable, American, Mountain Lion, and several others. The Senator Hill has four shafts; but two of these are now worked, with a force of ten men. Good ore is shipped regularly every week. On the Little Pittsburg, rich mineral has been encountered in shaft No. 2, which is 40 feet deep, and is timbered to the surface. The ore mills 161 ounces gold per ton. The Ward-Lamon continues to show good prospects. At a depth of 20 feet, good ore has been encountered in the Alice Fay. The Eclipse, located east of the famous Kekionga, has encountered a large body of low-grade ore. The American Eagle continues to ship regularly. The Mountain Lion is nearly ready for the resumption of work. Men have been diligently at work getting out water and rubbish, and this week the lower levels will be cleaned, when a large force of men will begin work.

CHAFFEE COUNTY.

MADONNA.—It is estimated that there are more than twenty thousand tons of ore in sight. This mineral carries forty per cent lead and from seven to ten ounces of silver per ton.

MONARCH.—The mine shows a vein a foot and more in width of good ore; the property is worked.

CLEAR CREEK COUNTY.

DIAMOND TUNNEL.—A new lease has been taken on the surface of the Corry City, and arrangements are making to put up machinery to pump out the water in the shaft and to otherwise prosecute work. There is a fine body of milling ore in the bottom of the shaft, but the shaft will have to be re-timbered before any more work is done there. Drifting is done on the lodes cut in drifting through the Corry City in the main tunnel, and as work progresses, better results are obtained, the streaks becoming more solid. Work is pushed on No. 5 lode with good results, the lower grade from this lode going 60 ounces silver and 10 per cent lead. In the V lode west, water has been encountered.

GOLDEN DUSTMAN.—It is reported that a strike of two inches of carbonate of copper has been made in this lode, on Soda Creek, at a depth of twenty-five feet. The crevice is two and a half feet wide; and besides this, the carbonate of copper which is on the hanging-wall carries from two to five inches of iron on the foot-wall.

KOHINOOR & DONALDSON.—The company will have the extensive building for its new mill completed and all ready to receive the machinery by the end of the present month. The dimensions of the building are 160 by 150, with a wing. The mill, when finished, will be one of the largest in the State. During the past week, regular shipments of smelting and milling ore have been made from the Champion and Donaldson mills.

DOLORES COUNTY.

An idea of the vast mineral resources of our district, writes a correspondent of the Denver *Republican* from Rico, may be gained from the number of pay mines which are now profitably operated, namely, the Grand View, Phœnix, Yellow Jacket, Newman, Chestnut, Swansea, Swansea Extension, Uncle Ned, Puzzle, Puzzle Extension, Lillian Davis, Pigeon, South Park, Garfield, St. Louis, Little Maggie, Zulu Chief, Johnnie Bull, Iron Clad, C. B. & Q., Spanking Jack, Parole, Santa Clara, Waubath, R. E. Lee, Carbonate, Nora Lilla, Corsair, Tex, Utah, Legal Tender, Fort Wayne, Hog Back, Black Demon, Bilzora, Sundown, Bancroft, Mogul, Bay State, Hope & Cross, Paymaster, Nos. 1 and 2, Petzite, Sinbad, Lackawanna, Midnight, Grand Duke, Nevada, Shamrock, Uncle Jess, Rico, Gunshot, Elgin Boy, François, Australia, Silver Duke, Black Hawk, Mabel King, Maid of the Mist, Camp Bird, Franklin, Orphan Girl, Santa Rosa, Belle of Rico, and Aztec. About one half of the above list is now shipping ore daily. The others may properly be classed among the mines not at present operated. All the mines will be worked this season.

GRAND VIEW.—The mines of the company are among the early locations of the camp, and are in name the Grand View, Yellow Jacket, Pelican, Major, Aztec, and Elliott lodes. They are well developed, there being in the aggregate 2308 feet of tunnels, shafts, drifts, and rises. So far this season, they have produced 1650 tons of ore. The smelter has been running successfully for some time. The company owns extensive coal-banks, operates its own coke-ovens, has a fire-clay claim, mines its own coal, burns its coke, and makes its brick. Notwithstanding the fact that the works are extensive, large additions will be made this season.

GILPIN COUNTY.

COLORADO DRY ORE CONCENTRATING AND SAMPLING COMPANY.—This company has been organized at Central City, with a capital of $600,000, for the purpose of constructing and operating concentrating and sampling-works in Colorado. The concentrating mill of Messrs. Thurmond & Hamilton, in Russell Gulch, and the State right for the Thurmond dry ore concentrator, have, according to the *Register-Call*, been purchased. The company will build a mill of from sixty to seventy tons capacity at Bonanza, Saguache County.

GUNNELL.—The statement for April shows smelting ore sold, $4549.88; gold retorts, $2503.50; tailings sold, $261.66. Total, $7314.99.

KEYSTONE.—This lode is now opened up for a distance of over 400 feet. The main shaft is down 110 feet; another shaft has attained a depth of 80 feet; both are connected by a drift. West of the deep or main shaft, a level has been driven 40 feet in length, which thus far has passed through a good-sized body of ore. In fact, so far as the developments have been extended in sinking or drifting, the vein shows up well, and in places six feet of crevice-matter are exposed. The average of the ore is stated to be four ounces gold per cord. The average width of the pay-matter is fully four feet.

MARGARET GLENNAN.—This lode has been tapped through the working of the Midas tunnel, 600 feet in from the entrance. At the point where the vein was intersected, a wide body of crevice-matter has been passed through 300 feet below the surface. Work on this vein was closed down some months ago, awaiting the driving of the Midas cross-cut, which will drain the vein to the depth as above stated. Levels are driving each way from the shaft, and an uprise to make connection with the main shaft.

GUNNISON COUNTY.

A correspondent of the Denver *Republican* states that considerable work has been done during the past winter. Among the most promising properties worked are the Whopper, Lulu, Eureka, Brittle Silver, Scorpion, Gray Copper, and Clarke No. 2, which has a fine large vein, and is developed by a 150-foot tunnel. At the depth of 140 feet, they struck a large body of mineral, which carries silver glance and galena.

Rock Creek will show up considerable mineral the coming summer. As there is good coal, it would be well to erect a smelter or concentrator at Crystal City this season, this point being the richest section of Rock Creek, with very little snow to interfere with the operating of mills all the year round, and mines within 1000 feet of town, and coal-banks eight miles from here, with a wagon-road most of the distance.

LAKE COUNTY.

COLONEL SELLERS.—The lower portion of this property, on Iron Hill, is operated by lessees, and a shaft has been sunk in the gulch. This shaft is 128 feet deep, and a large body of contact has been struck and penetrated about three feet. Assays have just been made which returned thirty-two per cent in lead, one and a half ounces gold, and sixteen ounces silver per ton.

ELGIN SMELTER.—A company of Chicago capitalists will start up the smelter very shortly. The machinery is now overhauling and remodeling, and the smelter placed upon a basis equal to any of the others in the camp. Contracts will be made for ore.

IRON SILVER.—In the Seventy-Six portion of the Iron Silver property, which is operated under a lease, a new strike was made recently. New prospect-drifts have been run from the old workings, and a body of high-grade lead carbonates has been cut, which is five feet in thickness.

LA PLATA MINING AND SMELTING COMPANY.—The result of the working for the quarter ended March 31st shows, according to the London *Mining Journal*, a net profit of $20,500. The management states that the only indebtedness of the company consists of money required from time to time to pay for ore purchased, and that such borrowings are represented in the ordinary course of business by ore on hand awaiting smelting, or bullion in stock or in transit. The profits realized as above stated will go to improve the financial position of the company and reduce the amount of loans, for which the directors at present give the banks their personal guarantee.

A dispatch from Denver says that the Harrison Reduction-Works at Leadville, a branch of the St. Louis Smelting and Refining Company, was destroyed by fire May 17th. The loss is from $60,000 to $70,000.

SAGUACHE COUNTY.

The erection of a concentrator and sampling-works of the same pattern as those now in operation in Russell Gulch in Gilpin County, has begun.

JUNE.—Active work is doing in this mine, the extension of the Rawley, and large quantities of ore will be shipped as soon as the road is constructed.

Digitized by Google

SUMMIT COUNTY.

A very large and enthusiastic meeting of citizens and miners was held at Kokomo recently, for the purpose of making a united effort for the development of the mineral resources of Summit County, and especially to bring into prominence the rich mineral deposits lying adjacent to Kokomo. The Denver *Republican* says it is a well-conceded fact that this rich mineral district has largely contributed to the bullion output of Lake County, for which it has not been properly credited, and the miners and mine-owners are determined that in this year's output they shall not be misrepresented, but will take their place as the second largest mineral-producing county in Colorado, to which they are justly entitled.

ROBINSON.—The machinery for the new concentrator to be erected at the mine by Mr. Greer, the lessee, has begun to arrive. The process will be dry, and, according to the stipulations of the lease, must be capable of treating 144 tons per day.

QUEEN OF THE WEST.—It is stated that another pocket of sulphurets has been struck in the tunnel. The ore will probably mill-run one hundred dollars per ton.

DAKOTA.

It is reported that a group of five mines, the Emma, Carrie, Nebraska, Flora Temple, and Marietta, together with the Mountain Lion Gulch water-right, has been leased to two Toronto capitalists, who have the option to purchase the property on or before July 1st for $250,000. The mines are in Nevada Gulch, Bald Mountain District, and are said to be valuable.

The Estrella del Norte, Deadwood, and Rockerville hydraulic companies are working with large forces, and are engaged almost wholly in placer mining. Prospects are good.

FATHER DE SMET.—The superintendent's report from April 22d to May 1st shows ore extracted from first, second, and third levels, 2700 tons. Ore milled, 2700 tons. North end tunnel advanced 10 feet; tunnel in 884 feet. Golden Gate north header advanced 11 feet; header in 94 feet. Tramway level rise up 59 feet.

MINNESOTA.—A dispatch to the New York *Tribune* says that the bond held by Boston parties on this mine, Silver Creek District, has expired, greatly to the satisfaction of the owners, who, after having tied themselves through the bond, discovered that middlemen were endeavoring to make for themselves $60,000, or considerably more than the owners were to receive by the agreement. The mine would now doubtless be producing largely but for the circumstances mentioned.

PANTHEON.—A large force of men is at work on this group, Box Elder, recently purchased by an English syndicate. The property will be thoroughly opened prior to the erection of two 120-stamp mills this season.

SITTING BULL.—Work at the mill has been delayed by bad weather, and the enlargement will not be completed for several weeks yet. The old part—ten stamps—continues in operation.

GEORGIA.

A correspondent of the New York *Evening Telegram* writes that, owing to the recent opening of a new railroad—the Georgia Pacific—through this country, the gold fever has again broken out in places, and this section is attracting the attention of men who have the inclination and the means to test the real merits of Carroll County as an ore-producing region. The people of Villa Rica are not very much worked up over their prospects of making speedy fortunes, although they have the strongest confidence in the wealth of the surrounding country. The owner of an abandoned mine near the town has been offered $8000 for her property, but indignantly refused the offer, and announced $100,000 as the very lowest cash price. On rainy days—and such days are very frequent here during February and March—the farmers around the village economize their time by "surface mining" for gold. Some of these farmer-miners have succeeded in getting rich returns for their rainy-day work. While none of the old mines is developed by the regular processes, owing to the great cost of improved machinery, the amount of placer mining done is surprisingly large, and in many cases where this surface mining is followed as a regular business it is very lucrative. The region about Dahlonega, in upper Georgia, is quite different in its geological formation from the country about Carrollton. Until this revival of the gold mining fever in Carroll County, the fact that Georgia is a gold-bearing State has been associated almost entirely with the region about Dahlonega. Should the experiments in Carroll County turn out as well as it is expected, it will not be long before Georgia will rank well as a gold-producing region.

IDAHO.

The Paragon, Hawkeye, Bull Dog, and Silver Dome mines, located in Little Wood River Mining District, one mile north of the Solid Muldoon mine, have been sold for $10,000. An undivided interest of 1400 feet in the American mine, and an undivided interest of 1350 feet in the Gray Eagle mine, have been sold to the same parties for $4000.

DAVITT.—The mine improves in depth. The force of miners is increased. The shaft is 40 feet below the lower tunnel. The first lot of ore from the mine, thirty-five tons, has been taken to the Hailey Sampling-Works.

EMERY.—The ledge is 12 feet wide, of which 4 feet are mixed carbonate and galena, assaying from 63 to 210 ounces, and carrying from 60 to 76 per cent lead to the ton. It is tapped, at a depth of 45 feet, by a tunnel about 100 feet long.

MEXICO.

A correspondent of the Mexican *Financier* says that a number of miners have been discharged from the Encino mine. It is understood that, as soon as the new Progreso mill is finished, work will be resumed and the ores will be sent there for treatment. There are from six to seven thousand cargas (112 pounds to the carga) of ore ready for milling, of an average value of at least eleven dollars per carga.

The Real del Monte is sinking the San Ignacio shaft to the Aviadero water-level. This will open up a sixty-foot stope of ore thirty feet wide and averaging 150 per ton.

The lawsuit pending between Landero & Co., as representatives of the Real del Monte Company, and a Mr. Pascoe, for the possession of the San Patricio mine, promises to be a long and bitter struggle, which may help to explain to outsiders some of the recent proceedings of this powerful company. The almost undisputed monopoly long enjoyed by these people in this mining district has certainly been an immense detriment to the country; for foreign capital has hesitated to invest in a district where it might at any moment come in conflict with the claims or pretentions of this well-established monopoly. The above case will probably be fought out, although it is an open secret that large sums of money have been offered for a compromise and withdrawal of the suit. The decision in this case will determine many other cases of disputed possession here.

At the La Blanca, the perpendicular shaft has been sunk 140 feet with a windlass. The purpose is to drive it still deeper until it intersects the Santa Gertrudis lode.

The Rosario, in El Chico District, has just erected a small horizontal steam-engine, which has already drained the mine to a depth of 200 feet. The property was abandoned some years ago from inability to handle the water.

At the San Sebastian mine, they are driving a cross-cut to intersect the lode which yielded rich metals at a depth of about 80 feet. This new cross-cut will strike that lode at a depth of about 250 feet.

The Guadalupe reduction-works have begun operations. It is a combination of the patio process and the Cornish crusher. The first run has been made.

A report from Chihuahua says that Mr. James Hitchens, the owner of most of the slags situated within and around the city, has, in connection with some Eastern capitalists and first-class metallurgists, commenced a general and thorough sampling of the slags, for the purpose of ascertaining their value and to decide upon the best class of metallurgical works for their proper and most efficient reduction. It is also the intention of the company to provide for the purchase and reduction of large quantities of silver, lead, and copper ores from the numerous surrounding mines.

NEW YORK & HONDURAS-ROSARIO MINING COMPANY.—Important strikes are reported to have been made recently in the mines of this company. The superintendent has telegraphed that every thing was highly satisfactory, and he assures good shipments of bullion during the present month. The great difficulties to be overcome and the large amount of work necessary in putting up pans, building flumes, etc., prevented an earlier start of the mill. Mining Captain Smith reports large bodies of rich ore in the Rosario, Matraca, Encinos, and New York mines. The vein in the fifth level of the Rosario is five feet thick, and is improving. The rich ore reported in the Encinos last December has not been removed, it being thought best to leave it in position until the mill was ready to receive it. It is now the intention to extract it at once.

MICHIGAN.

JACKSON.—A curious occurrence of ore has been developed by a drift to the south from the second level of No. 7 pit. This drift has been driven nearly 400 feet south from the main ore-body, following a narrow lead of ore from 4 to 5 feet thick, and which shows indications of widening out as it goes down. This deposit or lead seems to lie almost at right angles with and across the jasper formation, which lies to the south of the main opening, and apparently with entire non-conformity to the surrounding rocks.

NORWICH.—It is stated that arrangements are making to reorganize this company.

MONTANA.

POSER.—This mine, located on the east end of the great Rainbow lode, is developing into a property of great productiveness. Two shafts are sinking on the claim, the east shaft now being down 95 feet on the vein, and showing good ore all the way from the surface. At the 100-foot station, a cross-cut will be run north and south, to determine the full width of the ledge. It is from the west shaft that the ore is extracted. It is down only to the water-level, about 45 feet; the east and west drifts are vigorously forwarded, and in each drift a breast of ore 8 feet wide is extracting. No attempt is made to extract the full width of the ledge. Three eight-hour shifts are employed, and the daily product of the mine averages 25 tons, which could readily be doubled if desired. The Poser is leased, and its product is treated in the Silver Bow mill.

NEVADA.

ALBION CONSOLIDATED.—The superintendent writes that the fissure drift for the last week has run into hard lime. I have started a cross-cut at the point where the drift showed the best indications, and am now running the cross-cut nearly under the old chamber found in the east rise workings. I have discontinued in the second drift, as it had run beyond the uprise of the ore-bodies found near the line, and have started a drift near the ledge cave, which is more promising ground. The Uncle Sam rise is still in good ground. I have opened the most southerly of the flue-drift tunnels, and will continue it into the hill. Some of the ore-bodies found near the line and a few feet below the level of this tunnel and this ground can be developed to good advantage from this tunnel. We have developed some ore making above the large caves, and are now taking out some rich ore from this point. Some ore has also been found making off from the inside chamber, but very little has been done in it yet.

NEW MEXICO.

An important strike of gold ore has been made thirteen miles southeast of Santa Fé, and four miles northwest of Glorieta.

A report states that at a sheriff's sale at Socorro, the Silver Bar and Olla mines were purchased by J. D. Caughran, the highest bidder, for $55,600. These mines compose the Cooney group, in the Mogallons. By bad management, the owners became involved for about $80,000, and this sale was the result of judgment for debts.

SANTA RITA DEL COBRE MINES.—The Secretary of the Interior has declined the request of Martin B. Hayes to vacate the approval made by the Commissioner of the General Land-Office of entries upon the mines known as Santa Rita del Cobre, consisting of forty-five lode claims entered by D. H. Moffat, Jr., and patents will accordingly be issued in favor of the mining claimants.

TEXAS.

Advices from the Cariso Mining District, in Western Texas, state that an immense deposit of chloride and horn-silver has been discovered in the neck of country lying between the Pecos and Rio Grande rivers. The surface croppings of horn-silver are said to be very rich.

UTAH.

ANTIMONY REDUCTION-WORKS.—The works, which are situated 120 miles from Juab, are completed. The output of the property promises to be a steady one.

MAMMOTH.—Although the work at this mine has been disturbed somewhat by complications among the purchasers, it has not ceased by any means, says the Salt Lake *Tribune*. The refining-works have been completed, and there are fourteen furnaces done. The ores taken out during the last three months averaged $53 in value, summing the gold, silver, and copper. The mine is said to be improving. The theory has been adopted that it bends and pitches into the hill, like so many other big mines, about 300 or 400 feet below the croppings, although, if it is a contact vein, this is against the rule. But an incline has been started from the 400 level on this theory, and at 70 or 80 feet it is in a fine body of ore, which is opening by drift and cross-cut. This level has been driven farther north with encouraging results. A tunnel has been run into the big cave, and the loose material is to be taken out. The Young Mammoth, worked from the surface, lying just back of the old patented ground, is growing larger under working than the original ore-body, although there were few ever seen of such proportions. Something like $200,000 has been paid on the property, besides the money expended in the reduction-works.

ONTARIO.—The present run of the mill began eight months ago. The mill is now to be shut down for fifteen days, in order that it may be thoroughly repaired. Work has not been stopped in the mine. The inflow of water is great just at present, but not greater than can be handled. As the mine drains a large space of ground, large quantities of water flow into it in the spring. This is now decreasing, as the snow is rapidly disappearing.

WYOMING.

The mines of South Pass are looking well, and give fair promise of making a good showing this season. The Carrissa property has been leased. The mine has a large body of $15 free-milling ore in sight. Belonging to the property is a five-stamp gold mill, operated by water power. This mill can be doubled in capacity, the water-wheel and quantity of water being ample for this. This mill is located only half a mile from the mine, hence the cost of getting ore to the mill and reducing is small, and can be further reduced by putting in mo stamps, which will require no more hands to operate. On the Pitkin and G born, considerable work has been done. A shaft has been sunk; but owing to t water that was encountered, work was abandoned and a tunnel 400 feet length driven. The present outlook of the district is very good.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, May 18.

There was a better feeling in the mining market this week, and the transactions have been of a more general and better character than for some time past. The Comstock shares show quite an improvement in prices, and have been fairly dealt in. Some of the Leadville stocks have also improved in price. Sonora was the active stock of the market, but the price did not change materially either way. Eureka Consolidated was a feature of the market on account of its weakness. It suffered a very heavy decline, closing weak to-day. The total number of mining shares sold at all the Exchanges aggregates 237,700, as against 173,917 last week.

The Comstock shares were fairly dealt in, and were strong. California was quiet and steady, selling from 21@23c. Consolidated Virginia had an active business at strong prices; it sold from 48@55c. Sierra Nevada showed considerable strength under a small business, and sold from $3.90@$5.75. Union Consolidated was also strong, the sales aggregating 730 shares at $4@$5.13@$5. Mexican records a small business at steady prices, selling from $2.75@$3. Consolidated Imperial sold at 8c. Yellow Jacket records one transaction at $3.75. Best & Belcher was quiet and strong, selling from $3.75@$4.25. Sutro Tunnel had a fair business at steady prices; it sold from 21@20c.

The Leadville stocks were moderately dealt in at steady prices. Amie Consolidated had a small business and was irregular, selling from 20@17@18c. Chrysolite was steady throughout at $1.10, recording a business of 1700 shares. Iron Silver was fairly dealt in at steady prices; it sold from $2.90 $3.05@$3. Leadville had a small business, and was a little weak; it sold from 65@60c. Little Chief was quiet and steady, and sold from 52@50c. Little Pittsburg was very strong, under a fair business, selling from 57@90@88c. Climax sold at 9c.; the transactions were small.

The Bodie stocks had a small business, and were weak. Bodie Consolidated sold from $1.05@95c.@$1, with a business of 1000 shares. Standard was quiet and irregular, selling from $6.50@$6@$6.25. Bulwer records a business of 900 shares at 60@50c.

The Tuscarora stocks record small transactions, and were generally a little weak. Grand Prize sold from $1.15@$1, with a business of 1000 shares. Argenta sold at $1.15, with a small business. Navajo was a little weak, under moderate transactions, and sold from $2.40@$2. Independence was quiet and weak at 56@40c. Elko Consolidated sold at 20@21c., with a business of 2500 shares.

In the miscellaneous list, Alice was quiet and a little weak, selling from $3.25@$3. Bassick sold from $3.25@$3, with a business of 250 shares. Eureka Consolidated has been quite weak, under a small business, declining from $4.90@$2.65. The Green Mountain stocks were quiet and steady. Gold Stripe sold at 9c. Green Mountain sold at 79@77c., and Cherokee at 4c. Hall-Anderson records but one transaction, and that at $1.40. Homestake was moderately dealt in at steady prices, selling from $16.25@$16. Horn-Silver was irregular, with a small business, and sold from $6.63@$6.38@$6.75. Hukill declined from 8@6c., the business being small. Northern Belle records a fair business at very irregular prices; it sold from $7@$6.38@$7. Ontario was also irregular, under a small business, selling from $25.50@$24@$24.50. Robinson Consolidated records a fair business at irregular prices; it sold from 89@88@87c. Sierra Grande was quiet and weak, selling from $1.25@$1, with a business of 4700 shares.

Alta-Montana was very quiet at 4c. Bull-Domingo sold at 6c. Caledonia (B. H.) was quiet and steady at 75@80c. Central Arizona sold at 30c. under a small business. Decatur was active and steady, selling from 4@5c., the sales aggregating 22,200 shares. Harlem was quiet and steady, and sold at $1.40@$1.45. Lacrosse had a fair business at steady prices; it sold from 12@13c. Oriental & Miller records a small business and was steady, selling from 14@15c. Rappahanock sold from 8@7c. under a business of 8700 shares. Sonora Consolidated was very active and very irregular; it sold from 36@49@47c. South Hite sold at 15c.

The stockholders of the Harshaw Mining Company held a special meeting on Tuesday last, the 16th inst., at 62 Cedar street, this city, and decided to wind up the business of the company. The reason given for this action is the "petering" out of the mine.

The Iron Silver Mining Company has over $200,000 in its treasury, and will probably, at an early date, announce a dividend of $100,000. The company keeps $1,000,000 in reserve, and allows its profits to accumulate until they aggregate $200,000, when a dividend of $100,000 is distributed.

The Potosi Mining Company has levied an assessment of 25 cents per share. The Belle Isle and the North Belle Isle mining companies have each levied an assessment of 20 cents per share.

MEETINGS.

Bonanza King Consolidated Mining Company, No. 29 Wall Street, New York City. Meeting of stockholders, for the purpose of approving an agreement made and entered into on the 11th day of May, 1883, by and between the Trustees of the Bonanza King Consolidated Mining Company and the Trustees of the Trojan Consolidated Mining Company, to consolidate such companies into a single corporation, pursuant to chapter 960 of the Laws of the State of New York for the year 1867. June 16th, at two o'clock P.M.

Dunderberg Mining Company, Nos. 90 and 92 Broadway, Room 37, New York City. Annual meeting of stockholders and election of trustees, June 5th, at three o'clock P.M.

Golden Rule Mining Company, No. 115 Broadway, Room 126, New York City. Annual meeting of stockholders and election of trustees, May 25th, at three o'clock P.M.

Oro Cache Gold Mining Company, No. 1 State street, New York City. Meeting of stockholders, May 28th, at ten o'clock A.M.

DIVIDENDS.

The Contention Consolidated Mining Company, of Arizona, has declared its regular monthly dividend (No. 16) of twenty-five cents per share, payable May 28th, at the office of the Farmers' Loan and Trust Company, on all stock registered in New York. Transfer-books close May 18th.

The Homestake Gold Mining Company, of Dakota, has declared its fifty-seventh dividend of $50,000 (for April), payable at the office of the transfer-agents, Messrs. Lounsbery & Haggin, No. 15 Broad street, on May 25th. Transfers close May 19th. The total of the Homestake's dividends to date now reaches $1,112,500.

The Navajo Mining Company, of Nevada, has declared a dividend (No. 9) of twenty-five cents per share, payable May 14th.

PIPE LINE CERTIFICATES.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, May 17.

To say that the market for mining stocks is dull and inactive but feebly expresses the situation. There is so little doing in copper stocks that it is difficult to get reliable quotations from day to day, while the sales are almost entirely confined to two or three stocks, and those of the dividend-paying mines. At the morning Board to-day, there was not a transaction recorded, and the business of the week would hardly suffice to give one broker a good living out of his commissions. Calumet & Hecla is steady at $233@$234, with sales of less than 50 shares for the week. The advance in Quincy of last week was not maintained, the stock declining to $43 on small sales. Osceola sold at $21, same as last week. Franklin sold at $10⅛. Ridge sold at 65@75c.

In silver stocks, there is absolutely nothing doing. A few sales of Bonanza were made at $2@$2.⅛. Catalpa sold at 72½@75c., and a small lot at 70c. Harshaw, 50c.; and San Pedro, 45c.

At the Boston Mining and Stock Exchange, there is but little doing in the specialties dealt in. Empire is firmer at 22c. bid, but very little stock is offered, being held largely by a few parties interested. Massachusetts & New Mexico shows a little more firmness, with sales at 8c., while the bonds have advanced from $17@$24 on the report that the coupons due in June would be promptly paid.

3 P.M.—At the afternoon Board, Calumet & Hecla sold at $234. Catalpa broke from 72@65c., with sales after the Board at 62½c. We are informed that a dividend of 10c. per share will probably be declared, payable next month. Closing prices: Allouez, $2 asked. Atlantic, $10⅛ bid. Bonanza, $2@$2⅛. Antimony, $12@$15. Calumet & Hecla, $230@$233. Catalpa, 65c. asked. Crescent, 25c. bid. Franklin, $10 bid. Harshaw, $⅛@$⅝. Huron, $1⅛ bid. Osceola, $20 bid. Quincy, $4½ bid. San Pedro, 40@50c. Silver Islet, $4 asked. Sullivan, $1 bid.

BULLION MARKET.

NEW YORK, Friday Evening, May 18.

The market has been nominal and stagnant abroad and here, owing to the very liberal sales of bills on India by the Council in London, meeting all the demands for exchange and preventing an advance in silver which would otherwise probably have occurred.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
May 12	50⅛	109½	May 16	50 1-16	109⅜
14	50⅛	109½	17.	50 1-16	109⅜

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended May 18th, as compiled from various sources, amounted to $149,000, as against $157,000 reported for the previous week. The receipts from January 1st, 1883, to date are $4,985,713.58.

Foreign Bank Statements.—The governors of the Bank of England, at their regular weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 4 per cent. During the week, the bank lost £691,000 bullion, and the proportion of its reserve to its liabilities was reduced from 33 7-16 to 32⅜ per cent, against 42⅝ per cent at same date last year. The weekly statement of the Bank of France shows gains of 2,100,000 francs gold and 115,000 francs silver.

Since January 1st, 1883	6,542,026
Corresponding period last year	1,516,849

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.11 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 14½ per cent, to arrive at actual value.

Mines.	States.	Month of April.	Year from Jan. 1st, 1883.
*Alice, G. S.	Mont		$234,193
*Alta-Montana, G. L. S.	"		$10,625

METALS.

NEW YORK, Friday Evening, May 18.

Copper.—Lake copper is developing more and more strength. There is very little of it in second hands, and first hands decline to part with any. The lots which were constantly thrown on the market by manufacturers who had taken other fine kinds have all been disposed of. For brands recognized by consumers for uniformity and known to them so far as quality is concerned, of course this means increased firmness, and for Baltimore and Anchor we quote the range 14⅝@15⅝c.

On the other hand, we hear of sales as low as 14c.; and as these may be misunderstood both by consumers and by producers, it is necessary to state that in all transactions at such exceptionally low figures there are special circumstances. The copper is either low in quality or the brand is entirely unknown, so that only special inducements will move buyers. We quote good ordinary to choice brands 14⅝@15⅝c.

London cables a little better, £62 10s. f. o. b. for Chili Bars; and Best Selected, £67 10s.

The following are the latest English statistics for the first four months of the year:

		Jan. 1 to April 30. 1883. Tons.	1882. Tons.	1881. Tons.
Imports	Chili	14,035	12,013	10,782
	Other foreign	13,333	11,555	10,761
		27,368	23,568	21,543
Deliveries	Chili	12,261	14,781	13,697
	Other foreign	12,365	7,900	8,131
		24,626	22,681	21,828

Stocks in Europe and afloat from Chili and Australia were, on the 30th of April, 49,961 tons, against 47,053 on the 1st of January, 1883, and 50,598 on the 1st of January, 1882.

Ores and regulus were quoted, on the 1st inst., 12s. @12s. 6d. per unit.

Tin.—The market has rallied under the influence of small shipments from the Straits and a concentration of stocks here. Business has been fair at 21¼@22c. spot cash for Straits.

England cables at the close £96 5s.

Lead.—Beyond the sale of a number of small lots aggregating from 200 to 300 tons of Common and Refined at 4·40c., there is nothing special to report. The news of the burning of the Harrison Reduction-Works at Leadville is still too recent to have any effect upon the market. It will probably cause holders to be a little stiffer, but is not likely to influence buyers much.

From St. Louis, Messrs. John Wahl & Co. wire us to-day:

Our market is firm. Buyers seem anxious to purchase, but do not want to pay more than 4·12½c. for Refined. Sales for the week sum up over 300 tons of Refined lead at 4·12½@4·15c., and 130 tons of Hard lead at 4·12½@4·10c. Holders, anticipating better prices, have withdrawn from the market at present, and refuse to make sales for future delivery at present prices.

Messrs. Everett & Post, of Chicago, wire us as follows: Our market is very quiet. Transactions foot up to 400 tons at 4·15c. We close nominally at 4·15c., with 4⅛c. bid.

Spelter.—Spelter dull and without any features of interest. We quote 4·70@4·80c.

Antimony.—There is no change to report.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, May 18.

American Pig.—Although the officers of a number of companies are talking about blowing out their furnaces, they seem to be slow in making up their minds, and the conviction is gaining ground that they will need the stimulant of a further decline. It seems probable now that prices have not as yet reached bottom figures, and $18@$20 for Nos. 2 and 1 is quite freely talked of as a thing not in the distant future. Buyers, of course, under the circumstances are not rushing in to cover requirements. We hear of sales of a few thousand tons for immediate delivery. We quote $21@$22 for No. 1 Foundry, nominally with the market in buyers' favor; $19@$20 for No. 2; and $18@$19 for Gray Forge. Bessemer pig is dull at $21@$22, and Spiegeleisen, of which a sale of 3000 tons is reported, at $32.50 for 20 per cent material, is fairly active.

Scotch Pig.—The demoralization in the American pig market of course seriously reacts upon Scotch iron, which is now held above the former, and therefore attracts very little attention. The arrivals are small and freights are firm at 5s. There is no probability of their declining during June and July. Transactions are on a very limited scale. We quote, ex ship: Coltness, $24@$24.50; Glengarnock, $22@$22.50; Eglinton, $21@$21.50; and Summerlee, $24@24.25.

Steel Rails.—All the mills but one are now working quite steadily, and the majority of them appear to be supplied with work for from two to four months. The inquiry for small lots for early delivery is fair, but very little is placed. We quote nominally $38 at mill.

Old Rails.—Old material of all kinds moves off very slowly, and small lots are placed only by making concessions. We quote Ts $22@$22.50.

Scrap is dull and weaker. We quote nominally, $23.50@$24, though sales are made under special circumstances at lower figures.

Philadelphia. May 17.

The Eastern Pennsylvania iron trade is waiting for the disposition of the labor question in the West. Buying is restricted mainly to immediate, because of the uncertainties as to whether maximum production will be maintained. The consumptive requirements in the iron trade are large, but not sufficient to absorb the entire production. A heavy restriction has taken place already, in several important iron centers in the West, both in mills and furnaces. Inquiry is light and the tendency is strongly downward. The ore men have not yet yielded, and the furnace companies are in no frame of mind to close season contracts. The situation throughout Pennsylvania is unsatisfactory, but the troubles will soon be cleared up.

Pig-Iron.—Standard Foundry irons are held at $22 @$20, as usual, but a great deal of the iron sold is sold below these figures. Makers are endeavoring to sell for summer consumption, but buyers are not anxious to take any risks. Forge iron is in about the same shape. Furnace quotations run from $17 @$19, and a half a dozen large transactions were heard of at $18 for a good iron. A suspension in the West will indirectly affect this market, and hence consumers are waiting. Several furnaces have gone out of blast, and others will soon follow. There is no room for all the iron making, and there is no remedy but in suspension. Bessemer pig is not selling, and negotiations are off. Offers have been made at $21. Very little is done in foreign iron. One broker has succeeded in placing several hundred tons for summer delivery.

Muck Bars.—All the Muck Bar that was heard of this week sold at $34@$34.50. Production is a little above market requirements.

Blooms.—Sales of Blooms were made at $60 for Charcoal, although not best, and $50 is offered for Anthracite, and not taken.

Merchant Iron.—Merchant iron has hardened a little, and Best Refined is selling at 2·20@2·30c., but there is no difficulty in getting good iron at 2·15c. Some offers have been made at 2·10c. and may possibly be placed in country mills where the quality is not the very best. Four or five orders for ordinary iron for car use were placed this week in country mills in small lots at 2c. 1·90c. has been offered. The car-works are well supplied with orders, and the manufacturers supplying this demand look for steady work through the summer. Nails are strong and active. The assortments are broken up, and deliveries are made in car-load lots down to 10-keg lots. Bottom prices are $3, and outside mill prices $3.25. Stores are doing a good business supplying building demand

Plate and Tank Iron.—Prices are feverish, and large orders very exceptional. Tank is quoted at 2·40c.; Shell, 3¼c.; Flange, 4¼c.

Structural Iron.—The mills manage to keep well supplied with business at 2·40c. for Angles; 3¼c. for Tees; 3½c. for Beams and Channels.

Sheet-Iron manufacturers report demand of a retail character and card rates 3¾@4½c. A little improvement was noticed in galvanized iron for immediate delivery.

Steel Rails are in better demand at $38@$39. Several orders were placed this week, some for July deliveries, and large orders for September. Negotiations are in hand for delivery under $38.

Old Material is without any activity. Occasional lots move at $24. Inquiries for shipment are answered at $23.50. Scrap has been moving a little more freely in consequence of heavy concessions made. Sales of No. 1 are made at $26.

Pittsburg. May 16.

Notwithstanding the positive assurance given by manufacturers, there are a good many who believe that there will be a compromise before the first of June, and that production will be maintained all the time, which will necessitate a decline in the prices of finished and construction iron. As there are no evidences of the willinguess of the workmen to accept the reduction, it may be set down as a fact that there will be a strike. Manufacturers show their determination by refusing to take June orders. All have a moderate supply of iron, which, with care, will last several weeks.

A meeting was held last Friday, at which the wages

question was thoroughly discussed. Preparations are making to secure non-union men. The ore question remains unsettled; but in view of the probability of a suspension, furnace companies are not pushing negotiations. Lake Ore Foundry is selling at $22.50; Charcoal, $29; Mill iron; $17.75@$18.50. Large offers have been made, and negotiations are pending.

Stocks in consumers' hands are low. Muck Bars are $34.50@$35. Orders for Merchant Bars are coming forward freely. Assorted orders are filled at 2c., and customers are providing themselves against a scarcity Manufacturers of nails are refusing to book orders for future deliveries. Car-load lots are selling at $3, and jobbing lots at $3.15. Sheet-iron is in active demand, and requirements for galvanized are depleting stocks.

Cleveland. May 15.

The market for the last week has been quiet, although a fair amount of business is done in Foundry iron. There are still some off grades iron that are pushed, but most holders are willing to keep their metal unless ruling prices can be obtained. We quote:

No. 1 Bessemer	$22.00@$23.00
" 1 Foundry, all ore	21.00@ 22.00
" 1 Foundry, cinder mixture	20.00@ 21.00
" 1 Soft Foundry	20.00@ 21.50
" 1 Open Silvery	19.50@ 20.00
Mill irons	18.00@ 19.00
4 months f. o. b. cars furnaces.	
Nos. 1 and 2 Charcoal	$24.00@$26.00

Bessemer ores	$7.00@ $8.00
Hematite ores	5.00@ 6.00

COAL TRADE REVIEW.

NEW YORK, Friday Evening, May 18.

Anthracite.

There is very little that is new to report in the anthracite coal trade, beyond the fact that the companies have decided to work half-time next week, full-time the following week, half-time the week ending June 9th, full time the week ending June 16th, and half-time for the four weeks following. This shows that the companies are decided to check over-production, though they do not seem to be able to agree upon the more decisive step of stopping work altogether for one or two full weeks.

Some buyers seem to look forward to a possible rise, and are getting more liberal in their purchases, and inquiry has been a little stimulated; but it would be idle to deny that the great body of purchasers is still absolutely indifferent, and until the low-priced coal has entirely disappeared from the market, which it has not yet, there is little hope for a change in their attitude.

Bituminous.

The last contracts have been closed and the market is dull and lifeless. The rumors of the cutting of rates on the Baltimore & Ohio Railroad are substantiated, and we hear of low prices at Baltimore. Buyers, learning of the low figures at which the large contracts have been placed, insist that they should at the utmost pay 15 to 20 cents more, and the anxiety notably of shippers of Cumberland coal via Baltimore to place tonnage gives them encouragement. We quote Clearfield alongside, $4@$4.25; and Cumberland, $4.10@$4.40, according to quality.

STATISTICS OF COAL PRODUCTION.

Belvidere-Delaware Railroad Report for the week ended May 12th:

	Week.	Year. 1883.	Year. 1882.
Coal for shipment at Coal Port (Trenton)	1,752	21,187	12,338
Coal for shipment at South Amboy	10,167	300,688	271,023
Coal for distribution	10,270	287,841	243,955
Coal for company's use	1,776	52,910	47,355
Total	23,965	662,626	574,671
Increase		87,955	
Decrease			

Comparative statement of the production of anthracite coal for the week ended May 12th and year from January 1st:

TONS OF 2240 LBS.	1883. Week.	1883. Year.	1882. Week.	1882. Year.

C. RR. of N. J.	34,546	748,387	37,052	672,377
S. H. & W. B. RR.	3,064	15,153		15,000
	109,681	2,350,175	112,251	2,116,672
Schuylkill Region.				
P. & R. RR. Co	107,437	2,203,513	110,565	2,015,162
Shamokin & Lykens Val.	26,127	452,462	25,473	370,574
	133,564	2,655,975	136,038	2,385,736
Sullivan Region.				
Sullivan Line & Sul. RR. Co.	1,160	21,219	1,038	18,257
Total	456,022	9,647,799	428,752	8,486,970
Increase		1,160,829		
Decrease				

The above table does not include the amount of coal consumed and sold at the mines, which is about six per cent of the whole production.

Total same time in 1878 ..... 4,858,034 tons.
" " " " 1879 ..... 8,120,260 "
" " " " 1880 ..... 7,540,846 "
" " " " 1881 ..... 8,912,430 "

The increase in shipments of Cumberland Coal over the Cumberland Branch and Cumberland & Pennsylvania railroads amounts to 133,343 tons, as compared with the corresponding period in 1882.

The Production of Bituminous Coal for the week ended May 12th was as follows:

Tons of 2000 lbs., unless otherwise designated.

	Week. Tons.	Year. Tons.
Cumberland Region, Md.		
Tons of 2240 lbs	49,775	731,187
Barclay Region, Pa.		
Barclay RR., tons of 2240 lbs.	6,554	123,976
Broad Top Region, Pa.		
Huntingdon & Broad Top RR.	2,143	75,922
East Broad Top	485	19,634
Clearfield Region, Pa.		
Snow Shoe	4,694	92,333
Tyrone and Clearfield	47,655	990,316
Alleghany Region, Pa.

KERL'S ASSAYER'S MANUAL
JUST READY.

The Assayer's Manual. An abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor of the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brannt, Graduate of the Royal Agricultural College of Eldena, Prussia. Edited by William H. Wahl, Ph.D., Secretary of the Franklin Institute, Philadelphia. Illustrated by 65 engravings. In one volume, 8vo, 301 pages. Price $3, *by mail, free of postage, to any address in the world.*

EXTRACT FROM THE PREFACE.

"In view of the well-known thoroughness and accuracy of Bruno Kerl's various metallurgical works, the preparation of the present edition of his abridged Manual of Assaying has been undertaken with the conviction that it would be doing a real service to English-speaking students and teachers of the subject. Though presented in very condensed form, every method of importance will be found to have received notice, and its practical value duly estimated at its proper worth."

LOWER California is enjoying a "rush," it being reported that extensive gold placer ore-deposits have been discovered.

MR. J. S. PHILLIPS, mining engineer and metallurgist, has changed his headquarters to 52 State street, this city.

THE Chicago National Exposition of Railway Appliances was opened on the 24th with appropriate ceremonies. Among those who spoke were the venerable HORATIO ALLEN, who brought over from England the "Stourbridge Lion," and JOSEPH WHITEHEAD, who was fireman on the "Stockton" in 1827.

IN spite of the steady decline in the price of lead in Europe, the Mechernich mine, of Germany, the greatest in the world, has again paid a good dividend to its shareholders. The production in 1882 was 25,054 metric tons of lead and 5108 kilograms of silver, yielding a gross profit of 2,256,726·89 marks, and leaving, after writing off 879,559·43 marks, a net profit of 1,380,050·16 marks, out of which a dividend of 13 per cent on a hare capital of 9,600,000 marks was paid.

THE annual convention of the American Society of Civil Engineers will be held at St. Paul and Minneapolis, Minn., beginning June 19th. The programme has not yet been fully worked out; but four sessions are arranged for, and a number of visits to points of interest as well as a banquet tendered by the citizens of St. Paul and Minneapolis are on the *tapis*. The society, in order to accommodate members visiting the Chicago Exposition of Railway Appliances, will establish a headquarters there during the week beginning June 11th.

THE coke trade is now going through the reaction which an enormous development in the production, on the one hand, and a rapid shrinking in the demand, on the other, have made inevitable. According to the data given in the Census Compendium, Pennsylvania produced, in the fiscal year 2,317,148 tons of coke from 4,360,110 tons of coal. In 1882, according to the returns collected by the Secretary of Internal Affairs of Pennsylvania, 10,063 ovens in that State yielded 3,216,543 tons of coke. Beginning, in 1882, with an active demand in the great Connellsville region, prices at the oven ranged between $1.70 and $1.75. In June of that year, it fell off to $1.40 to $1.50, and, in September, the price reached $1.15 to $1.25. Rallying after the settlement of the troubles in the iron trade, it moved along steadily till the close of the year at $1.30 to $1.35; but the beginning of the present year witnessed a sudden decline to $1.20 to $1.25, and the cutting of rates continued during the month, February opening with $1.15; and during the month, coke was obtainable by close buyers for $1 per ton on cars at oven. Transactions based on $1 to $1.10 were made during March, and the reduction of freights toward the close of April did not improve matters perceptibly. Cutting began again in May, and now sales as low as 90 cents are reported. The coke-makers are getting alarmed, and propose to take steps toward restriction and the scaling down of wages.

THE Cleveland meeting of the American Society of Mechanical Engineers will begin on Tuesday, June 12th, with a session at which the Civil Engineers' Club of Cleveland will be present. The second day will be devoted entirely to the reading of papers, among which the following have already been announced: History of the Winding and Pumping Engines of the Anthracite Regions; Balancing Vertical Engines; the Marine Engines of the Lakes, with a Device for getting them off their Dead-Centers, by J. F. HOLLOWAY; the Bower-Barff Process, by W. F. DURFEE; Ingot Cranes, by G. CURTIS; Spiral Springs, by OBERLIN SMITH; and Steamboat Pipe Fittings, by W. J. BALDWIN. The society will on Thursday visit the works of the Otis Iron and Steel Company, the Cleveland City Forge and Iron Company, the Union Screw Company, Brush Electric Light Company, Cleveland Rolling-Mill Company, Standard Oil Company, Warner & Swasey's, and Cleveland Malleable Iron Company.

This is the first time the society has ventured on its travels, all former meetings having been held in Eastern cities. We feel confindent that the society will not regret having followed the hearty and urgent invitation which came from the Western engineers, through Mr. J. F. HOLLOWAY, who we notice is chairman of the local committee. The programme is a tempting one, and will no doubt contribute largely toward increasing the field of utility of the youngest of the three great technical societies in the United States.

THE reports for the three great pyrites mines, the Rio Tinto and the Tharsis in Spain, and the San Domingos in Portugal, have been published The Rio Tinto, mining an ore which, as coming from the mine, yielded on an average 2·805 per cent by wet assay, sold 272,826 tons of pyrites, carrying an average of 2·448 per cent by dry assay, and made 9740 tons of metallic copper. The profit was £738,308, £477,183 being available for dividends. In its roasting-heaps, the company has from 40,000 to 50,000 tons of copper. The company has a tunnel 7546 feet long, connecting the northern and southern workings, and the width of the ore for the entire distance is estimated to average from 160 to 200 feet, the hight above the tunnel level being from 200 to 230 feet. Explorations 230 feet below that level have proved the deposit with a width of 300 feet at that depth. This enormous block of ground is estimated to contain net from twenty to thirty millions of ore above the tunnel level in the southern part of the property, and the workings are now in such shape that the production of ore can be increased to from 1,250,000 to 1,300,000 tons annually, equivalent to about 40,000 tons of copper.

The Mason & Barry, or San Domingos mines, in Portugal, with a capital of upward of £1,200,000, yielded a profit of £276,719; while the Tharsis, as already noted, wound up the year's business with profits aggregating £335,676, making the total for the three mines £1,089,578, or about $5,263,000.

It may be of interest to metallurgists to state that the Mason & Barry Company is building works at Raniham, Essex, to make trials with a mechanical roasting-furnace, "with a view to placing before the manufacturers in England and America the actual commercial results."

OFFICIAL STATEMENTS AND REPORTS.

THE AMERICAN FERRO-MANGANESE AND IRON COMPANY.

A prospectus has been issued by this new company, organized under the laws of Georgia, which contains statements bearing upon the possibility of profitably manufacturing ferro-manganese in the South. With an abundant and cheap supply of ore, costing at the furnace not more than $5, and with access to fuel through the rapid extension of railroads into the coal-fields of Alabama, 75 miles from the ore-deposits, it is expected that works in Georgia will be able to supply at least a portion of the demand in this country. The chief promotor of the company is a gentleman who has had much experience in manufacturing ferro-manganese and spiegeleisen. At present, it is proposed to work three thousand tons of manganese ore, which will produce about twelve hundred tons of high-grade (from 60 to 70 per cent) ferro-manganese, the company leasing for the purpose of this work a first-class modern furnace supplied with all the adjuncts before mentioned. As there is no such furnace to be had for lease near the manganese ore-deposits, the company will be compelled to take one at a distance, and the cost of freight to it can be deducted in estimating what can be done later on. Such a furnace can be leased in a location to which the freight on the ore will be about five dollars per ton, making the ore delivered at the furnace cost ten dollars per ton. In that locality, coke costs from ten to ten and a half cents per bushel, so we estimate as follows for the experimental run of ferro-manganese produced:

2½ tons ore at $10	$25.00
150 bushels of coke at 10½ cents	15.75
1 ton limestone	1.00
Labor and superintendence	6.00
Lease of furnace	4.00
	$51.75

The present price of this article is, as before stated, $78 per ton. The company would then offer its product to the steel manufacturers at a much reduced price, as it could well afford to do, say at $65 per ton, bringing the cost of the unit of manganese under the price of the same unit in the shape of spiegeleisen.

THE BROOKLYN BRIDGE.

The opening to traffic this week, with much festivity, of Brooklyn's and New York's great engineering undertaking, the bridge, furnishes a fitting occasion for briefly reviewing its history and presenting a few data on the method of construction.

For years before the enterprise which has now been brought to a successful issue, the idea of uniting Brooklyn and New York by means of a tunnel or a bridge was repeatedly brought forward. In 1860, Mr. John A. Roebling, the builder of the Niagara and Cincinnati suspension bridges, was called upon to make an estimate of the cost of the bridge; but this first effort to organize a company and build the bridge failed, and it was not until the beginning of 1867 that an act was introduced incorporating the New York Bridge Company, which became a law on April 16th, 1867. Among other powers conferred, it authorized the cities of New York and Brooklyn to subscribe to the capital stock (which was fixed at $5,000,000, with power of increase) such amounts as two thirds of their common councils respectively should determine, and to issue bonds in payment of such subscriptions. Under these provisions, Brooklyn subscribed for $3,000,000 of stock, New York $1,500,000, while the remaining $500,000 was distributed among the incorporators. These latter constituted the first Board of Directors, and by them Senator Murphy was elected President; Mr. John H. Prentice, Treasurer; and Mr. Orestes P. Quintard, Secretary. On the 23d of May, 1867, the elder Roebling was employed as chief-engineer. His plans, submitted to the directors on the 1st of September following, fixed the cost of the bridge at $7,000,000, exclusive of the land required (an item itself amounting to $3,800,000), and the time of building at about five years. Modifications of these plans and changes and improvements of one kind and another have greatly added to these figures. In 1872, his son, Col. W. A. Roebling, having succeeded to his father's position as engineer-in-chief of this work, and the hight of the bridge having been reduced from 200 to the maximum hight of 135 feet, estimated the cost at $9,500,000. In 1873, when the estimated cost of the land was added, the total cost of the bridge was raised to $13,045,065, and in 1875 to $13,145,065. The act of 1875, however, provided that the interest on the bonds to be issued by the two cities should be paid by the trustees out of the money received by them, and this added $1.500,000 more to the cost. Then the structure was increased in strength over the original plans of the engineers, and that added considerably more to the cost. About $15,000,000 have been expended on the bridge now, and the total cost, when all improvements are made at the approaches and the arches are fitted up for warehouses, will not be much short of $16,000,000. The yearly cost of maintaining the bridge, including interest on the bonds, will be about $800,000.

In March, 1869, at the request of Mr. Roebling, a board of consulting engineers was convened to examine his plans and report upon their feasibility. Its members were Engineers Adams, McAlpine, Allen, Latrobe, Kirkwood, Steele, and Serrell, and the result of their inspection was an indorsement of all he had done. So much had been said about the obstruction to navigation which would be offered by the bridge that Congress directed a still further examination of the plans, and Secretary of War Rawlins appointed General Newton, General Wright, and Major King, three government engineers, for that purpose. They recommended an increase in the hight of the bridge of five feet, but otherwise gave the plans their approval. In accordance with this recommendation, changes were made in the proposed method of building the roadway, so that the span midway between the two towers is now 135 feet above high-water mark. At the same time, the bridge was widened from 80 to 85 feet. Mr. Roebling lived but a few months after the appointment of the government commission. In the summer of that year, while standing upon the rack of one of the slips of the Fulton ferry, directing the details of a survey, the shock of an incoming ferry-boat caused him to lose his balance, and one of his feet was terribly crushed between the heavy timbers that formed the rack. The injury resulted in lockjaw, from which he died sixteen days afterward. His son, Col. Washington A. Roebling, who had aided in drawing the original plans, was appointed his successor. The caisson disease made the son one of its victims within a twelvemonth. Although his physical health has been impaired to such an extent that he is a confirmed invalid, his mental faculties have retained their vigor, and during all these long years he has directed the work from an upper room in his residence on Columbia Hights, in Brooklyn.

The erection of the bridge proper began January 3d, 1870, when the work of preparing a place for the foundation of the Brooklyn tower was commenced by tearing out the spare slips of Fulton ferry. During the next four years, the history of the bridge was marred by complaints of fraud. Matters reached that point finally that an Investigating Committee of Fifty went to work upon the accounts and all the records of the directors. In the early part of 1873, they presented their report. This indicated very clearly that there had been laxity in the management, and that the interests of the two heaviest stockholders—the cities of New York and Brooklyn—had not been protected as they ought to have been. The pressure of public opinion was so great that Mr. Kingsley, on the 1st of June, 1873, felt constrained to resign his position as General Superintendent. The Legislature of the following year took the matter in hand, and passed a law investing the authorities of the two cities with power to go on and complete the structure, first extinguishing the title of the private stockholders by purchasing their shares in the new company and reimbursing them in full. Under the new order of things, the bridge became public property, Brooklyn paying for and owning 66⅔ per cent, and New York 33⅓ per cent.

A table of dimensions and of dates that will prove interesting in connection with this great bridge is the following:

Length of river span, 1595 feet 6 inches.
Length of each land span, 930 feet.
Full width of bridge flooring, 85 feet.
Hight of river span above water, 135 feet 6 inches.
Size of New York caisson, 172 by 102 feet.
Size of Brooklyn caisson, 168 by 102 feet.
Cubic yards of masonry in New York tower, 46,945.
Cubic yards of masonry in Brooklyn tower, 38,214.
Length of New York approach, 1562 feet 6 inches.
Length of Brooklyn approach, 971 feet.
Depth of New York foundations below high water, 78 feet 6 inches.
Depth of Brooklyn foundations below high water, 44 feet 6 inches.
Size of towers at high-water mark, 140 by 59 feet.
Size of towers at the top, 136 by 53 feet.
Total hight above high water, 271 feet 6 inches.
Hight of roadway at towers, 119 feet.
Hight of arches above roadway, 117 feet.
Hight of towers above roadway, 159 feet.
Width of openings through towers, 33 feet 9 inches.
Weight of each anchorage, 60,000 tons.
Size of anchorages at base, 129 by 119 feet.
Size of anchorages at top, 117 by 104 feet.
Their hight in front, 85 feet.
Their hight in rear, 80 feet.
Grade of roadway, 3¼ feet in 100.
Number of cables, 4.
Diameter of cables, 15¾ inches.
Length of each cable, 3578 feet 6 inches.
Miles of wrapping wire on each cable, 243 miles 943 feet.
Number of wires in each cable, 5282.
Number of suspenders from each cable, main span, 208.
Number of suspenders from each cable, land span, 86.
Number of post bands, each land span, one cable, 35.
Strength of a single suspender, 140,000 pounds.
Sustaining power of each cable, 12,000 tons.
Greatest weight on a single suspender, 20,000 pounds.
Greatest weight on a single cable, 3000 tons.
Number of overfloor stays, 432.
Total length of wire in each cable, 3515 miles.
Greatest length of cable wire run in one day, 88 3-5 miles.
First wire rope stretched over the river, August 14th, 1876.
River first crossed on a wire rope, August 25th, 1876.
Foot-bridge finished and crossed, February 9th, 1877.
First cable wire run over and regulated in the elevated position for strand making, May 29th, 1877.
Cable-making fairly commenced, June 11th, 1877.
Last cable wire run over, October 5th, 1878.

The first caisson was built for use on the Brooklyn side. It was 172 feet in length, 102 feet in width, and 22 feet in hight. Its top was 15 feet in thickness, being composed of layer after layer of solid yellow pine timbers, each a foot in thickness, crossing one another at right angles, and all bolted together in the most compact manner. The four sides of the caisson were 9 feet 6 inches in hight and 8 feet in thickness where they joined the top, and like the latter, were built of stanch timber bound together with similar heavy bolts. The sides tapered off in thickness, somewhat like the letter V, and at their bottom (corresponding to the point of the V) they were only about eight inches thick. An iron casting was bolted over this thin edge, in order to afford it strength and protection. The interior of this caisson was divided into six compartments by timber partitions two feet thick, strong and well braced. Through each partition were two openings high and broad enough to permit of the passage of a man with a wheelbarrow. All the inside joints of the caisson were well calked with oakum and pitched, to prevent the escape of air. A sheathing of tin was laid over the outside by the caisson to protect the timber from the attacks of sea-worms, and as a still further means of excluding water. Over this sheathing was a layer of three-inch planks saturated with creosote. Such were the precautions taken to insure an air-tight caisson and to guard against its decay. The spare ferry slip having been demolished, dredging to the depth of 18 feet was necessary. Into this berth the caisson was towed on the 2d of May, 1870, and the work of sinking it began. Around three sides of the berth was built a coffer-dam. The side next the water was similarly protected after the caisson had been floated into position. Derricks were erected, and, on the 15th of June, blocks of granite from the Maine quarries were

Digitized by Google

hoisted upon the top of the caisson for facing, the bulk of the masonry being made of Kingston blue limestone. Under their weight, the caisson began to settle. When the weight upon the caisson was such that its iron-shod edges rested fairly on the river bottom, compressed air was turned into it, the water was expelled, and workmen went down underneath with pick, shovel, and wheelbarrow to commence excavation. Water-locks and Morris & Cummings's dredges were used to receive the material. An air-lock furnished the means of ingress and egress, and into this on the afternoon of May 10th, 1870, Colonel Roebling, Engineer Martin, and Master Mechanic Farrington entered. Groping their way into the subterranean chamber into which the air-lock opened, the three men spent twenty minutes in an examination, but were glad to beat a retreat at the end of that time, gasping for breath and half roasted by the intense heat. Water was turned in, the atmosphere of the chamber was cooled off, and, preparations having been completed, men were sent down to begin excavations in earnest on the 10th of July following.

Two memorable events occurred in the sinking of this caisson. One was a blow-out, caused by the neglect of the watchman inside the caisson. The compressed air made its escape and a torrent of water and mud belched out from beneath the sides. The muddy column rose to a great hight. The superincumbent weight upon the caisson at this time was about 17,000 tons. The result of this sudden withdrawal of the support of the compressed air was a settlement of the whole mass—caisson and masonry—ten inches, a crushing of the shoe in some places, and a settlement in the center of the roof of about four inches. These damages were repaired after a considerable expenditure of time, labor, and money. The fire that was discovered in the caisson on the 20th of December, 1870, was far more destructive. One of the laborers had carelessly placed his lighted candle near a joint in the roof. A fire was communicated to the interior of the timber work, which burned over a space 50 feet square. The first indication of its presence was the discovery of a charred hole the size of a man's fist near the joint where the candle had been carelessly placed. It was never known how long the fire had been silently eating its course through the timber. Carbonic-acid gas, water, and steam were turned into this hole in the hope of extinguishing it. Auger-holes bored upward into the roof revealed the fact that the fire was still at work. In his anxiety at this threatening danger, Colonel Roebling entered the caisson, where he remained for seven hours. He was partially paralyzed the next morning. The result of that night's labors in the caisson are seen in his shattered health to-day. Flooding the caisson with water was the last resort. In five and a half hours, the caisson was filled with water. Nearly three months were consumed in making repairs to the caisson. When the work of sinking to the requisite depth had been completed, the interior of the caisson was filled with hydraulic concrete, the whole hardening and affording as compact a foundation as bed-rock itself. Upon it was reared the Brooklyn tower, with its symmetrical gothic arches and its cap-stones, 271 feet 6 inches above high-water mark. The sinking of the New York caisson was doubly tedious and troublesome. Nearly twice the depth had to be reached, the air pressure was greater in consequence, and its effects more disastrous upon the workmen. The experience already gained was valuable. All danger of fire, for instance, was averted by having the caisson lined with boiler-iron. The cost of this was $20,000. The cost of the great fire in the Brooklyn caisson was exactly three fourths of that sum. The Brooklyn caisson rested upon its bed of rock March 11th, 1871, and the New York caisson in May, 1872, the sinking of the latter having required less than a year's work. The construction of the two towers above the water-line was simple enough after the caisson had been laid. The Brooklyn tower was completed in May, 1875, and the New York tower in July, 1876. The latter imposes a weight of 90,000 tons of masonry upon its timber foundations, against 70,000 tons in the Brooklyn tower.

Next to the towers in importance are the two anchorages, massive piles of stone weighing 60,000 tons each, and situated 930 feet from the bottom of each tower. Their purpose is two-fold. They not only hold the ends of the cables securely, but they also form a part of the approaches to the suspended floor of the bridge proper. To economize material and labor, they were built, not of solid masonry, but with arched passageways running through them lengthwise. Their dimensions are 132 feet in length, 119 feet in width, and 90 feet in hight. Gradually diminishing in bulk, at the top they are 117 feet in length, 104 feet in width, and 80 feet in hight at the land ends. Work was begun on the Brooklyn anchorage in February, 1873. At the bottom of an excavation which had been extended below tide level were laid three courses of yellow pine timber, each stick being 12 inches wide and 12 inches in thickness. Being laid in water sources, they will always be covered and saturated with water; and thus protected from atmospheric changes, they can never decay. Upon this flooring was erected the superstructure of limestone and granite. Deeply imbedded in this mass of masonry are the four anchor plates (one for each cable), immense iron castings with arms like a star, each plate weighing 23 tons. They measure 16½ by 17½ feet on the face and are 2½ feet thick at the center. Riveted to the anchor plates are the wrought-iron anchor bars, which are nothing more than the links in a chain of iron extending to the top, where they receive the ends of the bridge cables. A "shoe" is the connecting link between the anchor bars and the cables. Around this shoe are wound the wires which compose the cables. After the cables were laid, several layers of granite were placed in position above the shoes. Chambers were left in the masonry, however, to enable the engineers at any time to inspect the shoes and determine the condition of the wires. It is estimated that the anchorages will stand ten times the strain that can ever be brought to bear upon them. On the other hand, an estimate of the strength of the four cables satisfies the engineers that one of the anchorages could be suspended from them without causing them to break. The New York anchorage is similar to the Brooklyn anchorage. More difficulty was encountered in building it; for it is on made ground at an outskirt of the region known as "the Swamp." In excavating for its foundation, the tide-water soaked into the pit so rapidly that engines with a capacity for pumping 600 gallons a minute were employed in freeing the excavation of water. With much labor, a foundation of piles was laid, and upon this was erected the superstructure.

The elder Roebling's plans provided for iron approaches, in the form of trestle-work, resting on piers of masonry. The change in the plans has resulted in a more solid structure and in one of the finest viaducts of modern times. The New York approach particularly is admired for its symmetry and the magnificent curves of its arches. Between Chatham street to the anchorage—a distance of 1562 feet 6 inches—seven streets are crossed, all of them by stone arches, except Pearl and Cherry streets. Across Pearl street, at Franklin square, has been thrown a substantial iron bridge, to which, in due time, will probably extend stairs leading from the elevated station beneath. At the Chatham street end of the approach, an iron building is erecting, so planned as to receive, if it is ever desired to use it for this purpose, cars directly from the elevated railroad. The Brooklyn approach is 971 feet in length, beginning at Sands street. The grade to the anchorage is easy enough for the heaviest team, being only 2 feet 9 inches in every 100 feet. Prospect, Main, and York streets are each spanned with an iron bridge. A building of iron and glass, to be used for railroad purposes, is situated near the Sands street end of the approach.

When the towers and anchorages were completed, the work of spanning the river with the cables was begun. On the 14th of August, 1876, a wire rope, three quarters of an inch in diameter, was drawn up the water-front of the Brooklyn tower, passed over its top, and let down again on the opposite side, where its end was seized and carried over the houses to the anchorage. The other end of this rope was placed on a scow, and, at a time when there was no passing craft in the river, this was towed to the New York shore, the rope being paid out into the river just as an ocean cable is laid. Then the rope was drawn up over the tower and carried back to the New York anchorage and fastened. By means of powerful engines, this rope, nearly a mile in length, was stretched to the required degree of tension, and the first link of steel was laid between the two cities. A second rope was extended the same day, and their ends were united around driving-wheels. The endless rope thus formed served as a traveler to carry other ropes and wires across, running in cast-iron sheaves on the tops of the towers. As many journeys would have to be taken by the workmen on this traveler, Mr. E. F. Farrington, the master mechanic, decided to show his workmen how easily it was done and to inspire them with courage by an example. A boatswain's buggy, with ropes from its four corners fastened to an iron ring overhead, was rigged up and attached to the traveler. In this frail seat Mr. Farrington seated himself on the afternoon of August 25th, 1876. At a given signal, the drums were started, and the adventurous voyager began his trip from anchorage to anchorage, starting from the Brooklyn shore. He was whirled over the tops of the houses and the river with amazing rapidity. Workmen stood ready to assist him on the tops of the towers, and having reached the New York anchorage, he turned around and sped back again. Exactly twenty-two minutes had been occupied in making the journey. Another endless rope was stretched between the anchorages after this, and then a heavier wire rope, known as a carrier. By means of these, the three small cables for supporting the cradles, in which the work of building the main cables was to be carried on, were put across and secured in their places over the tops of the towers. Then came the foot-bridge from anchorage to anchorage over the tops of the towers, with wooden slats for its bottom and nothing but a steel wire on either side to serve as a hand-rail.

The laying of the cables fairly began June 11th, 1877, and the last wire was run over the river October 15th, 1878. Sheds had been put up on top of the Brooklyn anchorage, and all the machinery was placed there. Eight enormous drums were put up for each cable. On each, 10 miles of wire were wound, making 300 miles in all. The wire, which was made of steel and then galvanized, had been dipped in linseed-oil several times until it was well coated. No. 7 was used, the thickness being a little over one eighth of an inch. As it was wound on the drums, the end of one coil was fastened to that of the next by a steel ferrule, which had inside screw-threads to match those cut in the ends of the wire. At the ends of the cables, the wires had to pass shoes which were to be fastened to the anchor chains, and these were put above their places while the wire was run around them, and then they were lowered and made fast. The wire, with one end fast to the shore, was put over a sheave or wheel which was attached to the traveling rope, and it carried the turn of the wire across the river, making two strands. On the New York side, the turn of the wire was put over another shoe. Another sheave carried over two strands more, and so in each cable, wire after wire was carried across until each strand was completed. The sheaves were sent back empty to start anew. Each separate wire had to be regulated to its proper place by men on the tops of the towers and in cradles, the proper catenarian curve being kept after the first one was made right. For each strand 139 circuits of wire were run out, making 278 wires. The strand was then bound tightly every fifteen inches of its length, and formed a rope three inches in diameter. At the ends it passed around the shoe or eye-piece, which was fixed, as soon as the strand was done, in its place between the ends of two anchor bars, and held in place by a seven-inch bolt. It took about half an hour to lay and regulate each circuit of wire if no delay was caused. But great obstacles were met with in the force of the wind and in the unusual expansion caused by the sun's rays, and storms and cold weather caused many delays. All the wire was galvanized, and then it received five coats of oil, to prevent any rusting where the galvanizing might get off. These were the first cables ever made of galvanized steel wire. Each joint where the wires are screwed together, was also galvanized. The wire was run out to its place at a speed of 11 or 12 feet a second. On the top of the towers, the cable strands were laid in saddles, one to each cable. Iron rollers were placed in position near by, and over these the wires first passed before being laid in the saddle. Any strain on the cables causing them to deflect at one part makes them move in the saddles, while the rollers take up the strain and prevent any wrenching of the masonry of the tower. Each of the four cables having received its allotted 19 strands, the work of binding them together and wrapping them with wire into a compact cylindrical form was next undertaken. All the temporary wrappings were removed, so that the strands were no longer separate, their wires being brought loosely together. With clamps and squeezers and wooden mallets the one-eighth-inch wires were finally compressed together, and then securely bound in that position by the permanent wrapping of steel wire. Each cable was then painted with white lead and oil, and for miles they could be seen glistening in the sunlight of any fair day. Each cable was 15¾ inches in diameter, or nearly 50 inches around. A remarkable accident happened in connection with the running of the wire on the

Digitized by Google

19th of June, 1878. One of the great strands broke loose from the New York anchorage, carrying with it the immense iron "shoe" and its ponderous attachments. The shoe left the anchorage with a "whiz," killing two men outright, and took a frightful leap of 900 feet over the tops of houses and streets to the foot of the tower. It rested there for only an instant. The weight of the quarter-mile of wire in the river span jerked it like lightning up the side of the tower, over its top and far into the river, where it quickly disappeared to the bottom. Three of the bridge workmen were seriously injured by this accident.

Following the completion of the cables came the fastening of the suspender bands to them at intervals of 7½ feet throughout their entire length from anchorage to anchorage. These bands were of wrought-iron five inches in width and five eighths of an inch in thickness. They were curved to fit round the cables, and the ends terminate in projections. The band was first heated until it could be opened far enough to go over the cable; and after they were in place, they were drawn together by a bolt which also held the suspender socket. When the bands were all in place, the suspender ropes were attached to them. These suspenders are steel ropes varying in length from 170 feet close to the towers to 3 feet in the middle of the central span. They are fastened by sockets to the suspender bands, and at the lower end is a stirrup-rod to hold the floor-beam in its place. The top of each suspender is fastened in the socket attached to the band by pins driven between the wires, and then the whole is filled with melted lead. The ends of the wires are turned over in riveting. Each suspender was tested to sustain 100 tons, and the extreme weight which will come upon each will be only 10 tons.

The suspension of the steel roadway from the suspenders was the closing piece of work in this great enterprise. Its weight when finally completed was 6740 tons. Some idea of the weight imposed upon the bridge can now be formed. The cables weigh 3460 tons, the suspenders 1180 tons, the timber flooring 2760 tons, and the steel rails for the car tracks 660 tons, making the total permanent weight of the bridge 14,680 tons. A load of 3100 tons can be placed upon it with perfect safety, but it is estimated that the maximum weight of moving passengers and vehicles which can be crowded on it is 1380 tons. In general terms, the roadway which has been thrown open to the public this week consists of a steel frame-work 85 feet in width suspended from the four cables by steel suspenders attached to steel floor beams seven and one half feet apart. Six longitudinal trusses divide the flooring into five parts. The two outer parts are for the use of vehicles. The two inner divisions are laid with steel rails and provided with endless wire ropes for hauling across the rapid transit cars. Between the two inner divisions and at some distance above them is the space devoted to foot passengers, 15 feet 7 inches in width, a promenade the most elevated and sightly that the world has ever seen. At the Brooklyn end is the machinery which will move the endless ropes and send the cars speeding across the bridge in five minutes' time. The cost of this system of rapid transit will be half a million dollars.

Although numerous accidents have occurred and many deaths have been noted among those employed on this wonderful bridge, it is recorded as a somewhat curious fact that no break has occurred in the engineering staff since the death of the elder Roebling. Associated with Colonel Roebling since the very beginning of the work were C. C. Martin, Col. W. H. Paine, Francis Collingwood, George W. McNulty, and S. R. Probasco, civil engineers, and E. F. Farrington, master mechanic. These gentlemen share with Colonel Roebling in no small degree the honor of its successful completion.

BESSEMER STEEL IN ITS CAST AND UNWROUGHT SHAPE.*

By W. D. Allen, Sheffield.

The rapidly extending use of steel in its simply cast condition, the growing certainty of its being in the near future used very extensively in this unwrought state, and the probability of its superseding cast-iron for thousands of important purposes, lead the writer to believe, that any facts bearing upon the question of steel casting can not fail to be of general interest. The Institute is already in possession of many facts, which have been brought before it at various times, relative to the progress made in casting Siemens-Martin, crucible, and other steels, and of the great success in this direction that has attended the operations at Terrenoire, and also of many valuable and scientific researches touching the properties, nature, and general characteristics of steel in its cast state, contributed by M. Pourcel and others. The writer, however, is not aware that any information has been before the Institute, relative to the progress which has been made in casting steel made by the Bessemer process.

Accounts have frequently been brought under your notice of the extraordinary producing powers of the Bessemer converter—how many blows could be got out in twenty-four hours, or how many thousands of tons could be turned out in a week. These achievements have generally received the attentive and approving ear of the meetings, and the writer feels assured this same courtesy will be accorded to him, although, when speaking of the Bessemer process, he makes quality and not quantity the chief consideration, and endeavors to show, when proper care and consideration are bestowed upon it, what an exceedingly valuable material this steel becomes in its simple cast condition, and how admirably adapted it is for the production of castings of various kinds.

The importance of this question can scarcely be overestimated. When we bear in mind the immense quantity of steel made by this process, and the large number of works throughout the country having it at their command, it will at once appear how desirable it is that such an immense source of supply should be made available to meet the large and ever-increasing demand for steel in its unwrought and simply cast condition. The writer feels strongly that Bessemer steel has not yet taken the important position it should hold as a certain and reliable material for castings, and the only object he has in committing himself to this paper is that of bringing before the Institute his experience in the production of steel castings, and of making more generally known what is doing in this material, in the hope that he may be able to impart some stimulus tending to promote the desired end.

* A paper read before the Iron and Steel Institute.

One grand application of Bessemer steel has of course been for rails. So marvelous has been its success in that direction, and so persistently as it been turned to that use, that there does sometimes appear to be a anger of this splendid material being neglected for other purposes, and ts use for rails becoming its ultimate destiny.

In the good old days of iron, any thing was thought good enough for a rail; and there is little doubt that the notorious application of Bessemer steel to this common purpose has tended to disparage it in general estimation for better things, and there are those who would still contend that its proper use is that of rails, and rails only. Such, however, is not the belief of those best acquainted with the material; nor is it the belief of the writer, who lays claim to having been the first person to work the process, both practically and commercially. Although he has done this on a considerable scale for twenty-four years, he has never yet made a rail, but, on the contrary has applied Bessemer steel to almost every other purpose to which steel could be or ever has been applied—from an intermediate crank-shaft to a cork-screw or a table knife; and in all these various applications he has always found Bessemer steel was in every way well adapted for the purpose. Hence it has fallen to his lot for many years past to make castings of it. Now, castings in Bessemer steel are not a novelty, for doubtless other users of the process have made castings. But so much has been done in that way at the works of Henry Bessemer & Co. that the writer ventures to speak with some authority upon the subject.

M. Pourcel, in his valuable paper on solid steel castings, read at Vienna, remarks: "Blow-holes, so to speak, remain a permanent order of the day in the proceedings of the Iron and Steel Institute." To this the writer thinks he may safely add, there is also a pretty general belief that a ladle of Bessemer steel is a seething boiling mass, quite unsuitable for making sound castings.

Now, when, in the face of all this, the writer has to affirm that sound castings, free of blow-holes, are daily made, in the ordinary course of business, from this material, he feels his statement will be received as rather a bold one. Such, nevertheless, is the fact, and it constitutes the chief feature intended to be brought before you by this paper. In ordinary practice, a ladle of Bessemer steel just out of the converter is no doubt in too lively a condition for making castings; but experience tells us that Bessemer steel is as amenable to the quieting and soothing influences of ferro-manganese, silicide of manganese, or silicide of iron, as steel made by any other process; and in order to bring a ladle of steel into a proper condition for running into castings, the agency of these alloys is to be resorted to. This fact was known and recognized at the works of Henry Bessemer & Co. more than twenty years ago, although at that date the making and offering for sale of ferro-manganese, silicide of manganese, etc., had not become a regular business, as it now has, and it was difficult to obtain these alloys with any degree of certainty and regularity. It was found, however, that a very siliceous pig, made at the Tow Low Works in Durham, was obtainable, which contained from 4 to 5 per cent of silicon, and this was used for many years; in fact, until the improved alloys were produced as ordinary articles of commerce. A small quantity of this siliceous Tow Low iron was added to the charge of spiegeleisen whenever it became desirable, for any special work in hand, to quiet the steel and insure greater soundness; and if the blow was not too hot, or was allowed to lie in the vessel a sufficient time to cool down, it was found to answer pretty well. The solidity of many articles exhibited by Sir Henry Bessemer at the Great Exhibition of 1862 was obtained in this way. Judicious and proper care should, however, be exercised in administering these alloys; for the fact should not be lost sight of, that in their use we are, after all, introducing impurities into the steel—impurities that become very deleterious when in excess, giving a harshness and a hardness to the metal, which tend to deprive it of that beautifully soft, ductile nature so characteristic of good Bessemer steel.

It therefore becomes important, when we do add these quieting agents, to use no more than is absolutely necessary for the purpose, and to see that we obtain the maximum amount of duty from a minimum quantity of the compounds. To insure this result, the agitator (already described by the writer before this Institute) should in all cases be used, as by its agency the small quantity of alloy is quickly and uniformly diffused throughout the ladle of steel, and its full potency obtained. The writer knows of no other means whereby this very important object can be thoroughly effected. In passing, the writer can not refrain from expressing regret that this agitator has not been brought more generally into use; in fact, he has not heard of a single instance of its adoption in this country, although it is, of course, free to all. He trusts, however, that it may have been used without his knowledge; and if so, he can only say that he shall be delighted to hear that such is the case. He can assure the members that the advantages of its use daily manifest themselves in his works, and he is quite sure that much of his success in obtaining sound castings is attributable to its use.

The use of silicon is not necessary in order to produce sound castings. At the works of Henry Bessemer & Co., the only quieting agent is ferro-manganese. A ladle of Bessemer steel judiciously alloyed with ferro-manganese (the ferro-manganese being thoroughly diffused throughout the mass by the aid of the agitator) will run dead and lie perfectly quiet, sinking in the molds like ordinary cast-iron, and a large dead head will always be necessary to feed the casting. In this way are cast cranks, side-cranks, cross-heads, cylinders, rollers, spur-wheels, and various other similar pieces of machinery, which, when finished bright over their whole surface, show neither blow-holes nor blemish of any kind. It is well known, however, that the Bessemer system, as at present generally arranged, is not adapted for making small ingots, that is, ingots under 5 or 6 cwt. each; and from the same causes, it is not adapted for making light castings. A mass of five tons of steel rapidly cooling and prone to set in the ladle does not admit of the delays incidental to running it into small quantities, and the crucible or the open-hearth processes, where the steel can be retained in the furnace until required for casting, have advantages over the Bessemer in this respect.

The success in making sound castings of Bessemer steel, claimed in this paper, is not simply an experimental success, but is a regular and daily practice; and to give one instance as an illustration of the regularity with which it is done, the writer may mention the fact that, during the last four years, amid a multiplicity of other things, he has made 486

Digitized by Google

hydraulic cylinders of various sizes, as they have happened to be ordered, all of which have been tested up to two, three, and four tons per square inch, while he has never had the misfortune to have one fail in these tests, or to have one of all this number returned upon his hands, through having failed while in use.

And now as regards quality, admitting the ready and perfect practicability of casting Bessemer steel sound and free from blow-holes, there will hardly be a diversity of opinion as to the value and excellence of the material in that state: it is very strong, pure, and homogeneous in quality, and its soft and ductile nature renders it all that can be desired. It also tools beautifully, and some turnings that have come off castings that have never received a blow from the hammer are upon the table, and they serve to give a better notion of its beauty as a simply cast material than all that can be said on this point. The temper or hardness of the steel may of course be varied by the addition of more or less spiegeleisen; but it is rarely found necessary to deviate in this respect with the ordinary run of castings; for although not hard, the continuity of the material renders it exceedingly strong and durable.

The analysis of castings of ordinary quality may be fairly taken at—.

Carbon	·30 to ·40
Manganese	1·25
Silicon	trace.
Sulphur	·06
Phosphorus	·07

The feeling which has at all times so generally prevailed, that it was impossible to obtain this material sound and free from blow-holes—as if such were inherent to the process—has always been a blot upon the escutcheon of Bessemer steel; a blot, however, that the writer considers has always been painted in too deep a color, and which he now contends should be rubbed out altogether. This done, it will be found that there is no better material for castings than Bessemer steel.

RECENT PROGRESS IN THE METALLURGY OF NICKEL.

We have from time to time recorded the success of the efforts made abroad in the manufacture of pure nickel, and the progress made in securing new applications for it. As foreign experimenters have taken much pains to keep their aspirations and their results before the public, it has been the impression of all but a few who had special opportunity to inform themselves that the credit for the results achieved was due chiefly if not exclusively to those who have labored in this field in Germany and in France. It is the merit of Prof. W. P. Blake, of New Haven, to have come forward to correct that opinion; and while giving full credit for good work done by others, he has directed attention to the fact that Mr. Joseph Wharton, of Camden, N. J., was in reality the first to produce pure nickel in a malleable state and in considerable quantities. Professor Blake exhibited a remarkable series of specimens at the Boston Meeting of Mining Engineers; and from the paper read on that occasion, we take the following interesting data:

Inasmuch as nickel first became known commercially in the industrial arts in the form of an alloy, there were no special attempts to produce the metal in a state of extreme purity. The nickel-silver of commerce answered all the existing demands, and was of course much easier to make, and cheaper than the pure nickel. It found a large and rapidly extending consumption as a substitute for silver spoons and forks and for silverware generally, especially when the new art of electro-plating was developed by Spencer, Smee, and others. The nickel-silver was specially well adapted to receive and hold the deposit of silver, and it is to this day the most desirable alloy for plating.

The use of nickel alloy for small or subsidiary coins next made an increased demand for nickel. Tentative efforts were made by Dr. Feuchtwanger, in New York, in the year 1837, and he actually issued many one-cent and three-cent pieces, made of a nickel alloy, the exact composition of which he was careful not to state, but called it "Feuchtwanger's Composition." Switzerland began using nickel alloy coins in 1850; the United States in 1857, though sample coins, one-cent pieces, had been made by Prof. James C. Booth, at Philadelphia in 1853, the prepared alloy containing from 5 of nickel and 95 of copper, to as high as 30 of nickel and 70 of copper. The alloy adopted by law consisted of 12 of nickel and 88 of copper. The five-cent pieces now in circulation are made of an alloy of 25 parts of nickel and 75 parts of copper. In 1860, Belgium adopted an alloy of the same proportions, for small coins. Other countries have followed, until the use of nickel alloy for small coins may be said to be almost universal in the chief commercial countries. Up to June 30th, 1876, the United States had alone issued of the five-cent nickel to the extent of $6,716,129 in value. Another sudden demand for a larger supply of nickel sprang up when the art of depositing nickel by electricity was perfected. The many and increasing applications of this art need not be here enumerated. It is sufficient to state that, at the present time, they constitute a large part of the present consumption of the metal in this country, where the art may be said to have originated in a successful, practical form.

Nickel ore is more generally distributed throughout the mineral-bearing portions of the United States than is generally supposed. It is commonly associated with chrome ores from Canada to Maryland on the Atlantic side, and equally with the chrome ores of the Pacific slope, notably in Oregon. It is also a common associate of magnetic pyrites in the Archæan rocks, being found in Litchfield County, in Connecticut; in the Highlands of the Hudson, in New York and in New Jersey; and specially at Lancaster Gap, in Pennsylvania, where the chief supply of nickel has been obtained for the United States. This ore yields from 1¼ to 2 per cent of nickel, but is enriched by smelting at the mine into a matte containing 10 per cent or more of the metal. This locality was worked some thirty years ago by Prof. James C. Booth and others, of Philadelphia, and some nickel alloy was made. Some ten years later, Mr. Joseph Wharton purchased the works and established the industry at Camden, N. J., opposite Philadelphia, where it has since been carried forward.

A large portion of the metal produced at these works by Mr. Wharton has been used at the United States Mint for the subsidiary small coins, and a considerable amount has been exported. Since the development of nickeling by galvanism, a large part of the product has been put into the form of nickel salts and anodes.

But Mr. Wharton, not being content with the production of impure nickel, early began experimenting to determine whether nickel could not be produced in a pure and malleable condition, susceptible of being worked in nearly the same manner as iron, and of being applied in the manufacture of various objects, requiring strength of material and a material that can not be easily oxidized. One of his earliest experiments was to take the somewhat spongy mass got by reduction of the oxide of nickel, and, after heating it to full redness, work it under a steam-hammer into a bar.

In 1873, Mr. Wharton sent to the Vienna Exhibition a sample of nickel in the form of axles and axle-bearings, and at the Exhibition in Philadelphia in 1876, he exhibited a remarkable series of objects made of *wrought nickel*, such as bars, rods, a cube, a horse-shoe magnet, and magnetic needles of forged nickel. These did not excite the interest to which they were entitled as a remarkable advance in the working of this little-known metal. The exhibit did not cause much comment, and it was not specially described or reported upon, so far as I am aware, except by the judges who reported the exhibit to the Commission as worthy of an award in the following terms: "A fine collection of nickel ores from Lancaster County, Pa., with nickel-matte, metallic nickel in grains and cubes, and manufactured nickel, both cast and wrought; nickel magnets and magnetic needles, cast cobalt, electro-plating with nickel and cobalt, and salts and oxides of both these metals; the whole showing a remarkable degree of progress in their metallurgical treatment." *

Some of the same objects formed of wrought nickel were sent over to Paris two years later, and were exhibited in the American section in 1878. There, as in Philadelphia, they did not at first excite any surprise or receive any special attention. Very few persons realized what the objects really were, and that they were very different from *alloys* of nickel. In fact, very few chemists had ever seen *nickel*. Pure nickel was a rarity, a curiosity, just as samples of indium or thallium are to-day.

You can then, perhaps, imagine the incredulity of the expert chemists and metallurgists of Europe, when whole ingots and forged bars of metal and numerous finished articles of pure wrought nickel, without alloy, were offered for inspection. These articles not differing greatly in their appearance from the higher grades of nickel alloys, or from electro-nickel objects, they passed them without surprise. No previous exhibition had been so rich in exhibits of the use of nickel and in the products from them. The influx of the pure carbonated and oxidized ores from New Caledonia had greatly stimulated the nickel industry in Europe, and had improved the quality of the alloys of nickel. New companies had been formed to manufacture nickel-silver and to produce nickel from these superior ores, at a lower cost than had before been possible. Christofle, of Paris, had just erected extensive works at St. Denis, and had made a most brilliant display of his products in one of the main avenues of the Exposition. The Vivians, of Swansea, and other exhibitors, had large cases filled with beautiful objects of hollow and solid ware made of nickel-silver. Amid these various exhibits of striking *tours de force*, the modest little show-case from the United States with examples of manufactures of *pure wrought nickel, not alloy*, could hardly be expected to excite attention and win the golden award, which was most cheerfully accorded as soon as the fact was demonstrated by analysis that the objects were really of the pure metal. Some of the objects now shown were at that exhibition, and have retained their brilliant polish and luster unimpaired. These notable advances in the metallurgy of nickel, made with the lean and sulphureted ores of Lancaster Gap, prepared the way for greater advances.

Dr. Fleitmann, of Iserlohn, Westphalia, Prussia, has improved and cheapened the operation of refining the nickel and toughening it, and has reduced the liability to the presence of blow-holes in castings by adding to the molten charge, in the pot, when ready to pour, a very small quantity of magnesium. This is immediately decomposed, magnesia is formed, and graphite is separated. It would seem that the magnesium decomposes the occluded carbonic oxide, or reduces it to a minimum. The magnesium must be added with great care, and in small portions, as it unites explosively with the charge. It is stirred in. About one ounce of magnesium is sufficient for 60 pounds of nickel. From three quarters of an ounce to 54 pounds of metal have been used with success by Mr. Wharton. The nickel from the ore at Lancaster Gap seems not to require as much as the foreign metal. It is to be noted that complete malleability of nickel was obtained at Wharton's works in Camden, before Fleitmann's invention or process, but this last is more rapid and better than the old method. The metal so treated becomes remarkably tough and malleable, and may be rolled into sheets and drawn into wire. Cast plates can be successfully rolled. The cast plates, such as are made for anodes, after reheating, are rolled down to the desired thickness. It is found that it is a great improvement to the nickel anode plates to roll them down. They dissolve with greater uniformity in the bath. Nickel so treated with magnesium has been rolled into sheets as thin as paper. Expensive works for rolling the metal have been erected by Mr. Wharton at Camden. There is already a train of 40-inch rolls, 18 inches in diameter, with annealing-ovens and gas-furnaces and their adjuncts, and a 90 horse-power engine. At present, this mill, as well as the works for producing the metal, and the mine, also, are "shut down. The largest sheet yet rolled at Camden is 72 inches long and 24 inches wide, of pure nickel.

Dr. Fleitmann has also succeeded in welding sheet-nickel upon iron and upon steel plates, so as to coat them equally on each face with a layer of nickel. The quantity preferred by weight is $\frac{8}{10}$ iron and $\frac{2}{10}$ nickel, one tenth of nickel being placed on each surface. To secure union, the iron or steel must be perfectly flat and clean. A pile is made with outer facings of sheet-iron, to protect the nickel from scaling. When the whole is heated to the proper degree, it is passed through the rolls. The two metals become so firmly united that they may afterward be rolled down two or three together, or separately, to the thinness desired.

IN order to decrease the dimensions of fly-wheels, builders are beginning to cast lead into the rims.

UTILIZATION OF BY-PRODUCTS IN THE MANUFACTURE OF COKE.—I.

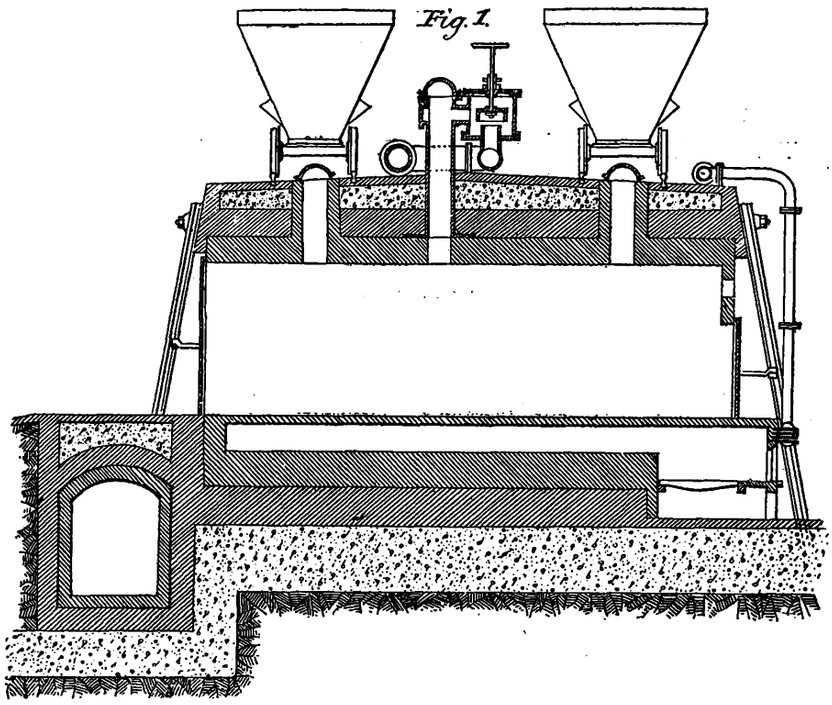
Notwithstanding the fact that for many years the utilization of the tar and ammonia liquor has been a very important industry in gas manufacture, the gathering of these products in coke-making has only attracted attention during the past few years. Our columns have reflected the movement now going on abroad, and we propose in this series of articles to place on record the different systems thus far brought forward, together with the data of actual work accomplished. It is to be regretted that on the latter point the figures are as yet very meager. We shall discuss them after a presentation of the ovens used.

The Carvés System.—Beginning with the system longest in use and most thoroughly tried, we abstract the following from a paper read by Mr. H. Simon before the British Iron and Steel Institute in 1880:

Each oven is in the form of a long, high, narrow chamber of brickwork, and a number of these are built side by side, with partition-walls between them sufficiently thick to contain horizontal flues. Flues are also formed under the floor of each oven, and at one end of these is a small fire-place, consisting of a fire-grate and ash-pit with suitable door, the fire-door having fitted above it a nozzle, through which gas produced from the coking is admitted, to form a flame over some fuel burning on the grate. Only a very trifling amount of such fuel, consisting exclusively of the small refuse coke, is used here, its function being really more that of igniting the gas than that of giving off heat. These grates are not charged with fuel more than twice every twenty-four hours when in regular work.

The products of combustion pass from the fire-place along a flue under the oven floor to the end farthest from the fire. They return along another flue under the floor to the fire end; they then ascend by a flue in the partition-wall to the uppermost of several horizontal flues formed therein, and *descend* in a zigzag direction along these flues, finally passing into a horizontal channel leading to a chimney. Thus the coke-oven is heated not only at the bottom in the usual manner, but also evenly at the sides, and the coal with which it is charged becomes rapidly and completely coked. No air is allowed to enter the ovens, which, in reality, are closed vessels, with the exception of the openings for the escape of the volatile products.

Fig. 1.



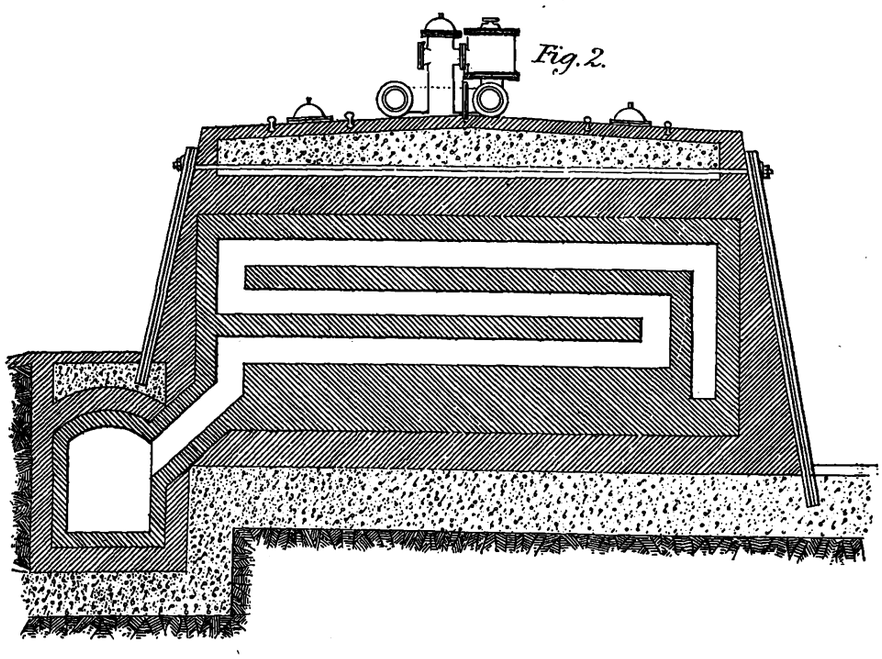


Fig. 2.

In the bee-hive and similar ovens, coking can not be carried on without a considerable quantity of air being admitted during a certain period, at least, of the process. Coking under such conditions, therefore, is carried on at the expense of the combustion of part of the coke made. In these ovens, no air is admitted, and no coal or coke is burnt; hence, there is a greater yield of coke, amounting up to say 75 per cent of the coal charged. At the same time, the coke produced must obviously be purer than that produced in the bee-hive class of oven; for the quantity of ashes and impurities existing in a given ton of coal will in this case be contained in a larger quantity of coke than in the case of coke made in the bee-hive oven.

The improved ovens are fed with coal by openings in the roof, over which coal-trucks are run on rails; and the coal is evenly distributed by rakes introduced at end openings provided with doors, faced with refractory material, which doors are closed and kept tightly luted while the oven is in operation. The feed-holes in the roof are also provided with covers. Through the middle of the roof rises a gas-pipe provided with an hydraulic valve, which closes the passage by a lip projecting down from it into an annular cavity surrounding its seating, in which it is immersed in a quantity of tar and ammoniacal liquor lodged there during previous distillations. The volatile products of the coal distillation rise by the gas-pipe, and are led through a range of pipes kept cool by external wetting, so that the tar and ammoniacal liquor become condensed and separated from the combustible gas.

The quantity of these by-products depends, of course, mostly on the nature of the coal used. The richer the coal is in bitumen or gas, the greater the value of the by-products. Much also depends on the proper conduct of the temperature at the different stages of the coking process; for it is quite possible to obtain even from the same coal different proportions, quantities, and qualities both of the coke and the by-products.

Practical experience must in each case determine what is best adapted to local requirements and circumstances.

The mode of the collection of the by-products is very much like that used in gas-works. The cooling-pipes are conveniently arranged in pyramidal form, surmounted by a water-pipe having numerous holes, so that a shower of water descending on the uppermost of the cooling-pipes and on the outermost is scattered over all their surfaces. The gas, when thus separated from the condensed materials, is further passed through scrubbers, or vessels containing coke moistened by the ammoniacal liquor, which, on being repeatedly used, becomes stronger and stronger until it reaches saturation, when it may be run off into reservoirs, to be treated in the ordinary way for the preparation of ammoniacal compounds, or sold in its crude state for the manufacture of soda. All valuable by-products having thus been withdrawn from the gas, it is led by pipes to the nozzles at the fire-places under the sole of the ovens, where it is burnt. It has been found that the extraction of gas from the ovens by artificial means (say a Beal's exhauster similar to those used in gas-works) is more regular, and therefore preferable to extraction by the natural draught of the chimney only, as the latter varies often according to wind and temperature. When a charge is nearly finished and ready to be taken from the oven, some trucks full of coal are placed ready on the rails going right along on the top of the ovens and over the charging-holes. The two end doors are then opened. The mass of coke, measuring about 30 feet long by 2 feet thick and 6 feet high, is pushed out at the back of the oven and on to the bank by means of a ram or piston, worked by a portable steam-engine running on rails in front. The ram can be brought opposite to each oven in turn. The coke is then quenched as usual.

The watering or quenching operation should be performed with care and judgment. On the one hand, the mass of incandescent coke should, as soon as it is out of the oven, be extinguished as quickly as possible, to avoid loss of coke by actual burning; and, on the other hand, care must be taken not unnecessarily to saturate the coke with water. The coke produced in such ovens, side by side with other systems and out of the same coal, is preferred by the blast-furnace managers. Similar experience has been communicated to me from the Ebbw Vale Company with regard to the coke from their Coppée ovens, which, as already mentioned, have very much the same shape and size

as these. Immediately after the discharge of an oven, the top openings are opened, the coal from trucks emptied into the hot oven and raked level; the doors and top openings are then closed again, and the process begun afresh. The operations of discharging and refilling, when well conducted, need not take more than from ten to fifteen minutes.

The Terrenoire Company, in France, originally introduced a modification of this process in the year 1867, and has since then, from time to time, increased the number of such ovens at its different works. Their proportions and construction generally have during these years undergone continued and considerable alteration and improvement. Experience has shown that a great deal depends upon the dimensions of the vertical sections of these ovens. At the outset they were made too wide and too low, and the density or hardness of the coke was, under such circumstances, not such as was desirable. From a width of 6 feet 6 inches, they have gradually come down, until at present they recommend about 2 feet only, and a hight of at least from 6 to 7 feet. It is interesting to notice the beneficial effect upon the hardness of the coke which the reduction in width has had.

M. Jouguet, the director of the Bessèges Works, belonging to the Terrenoire Company, has made for me the experiments specified in the following table:

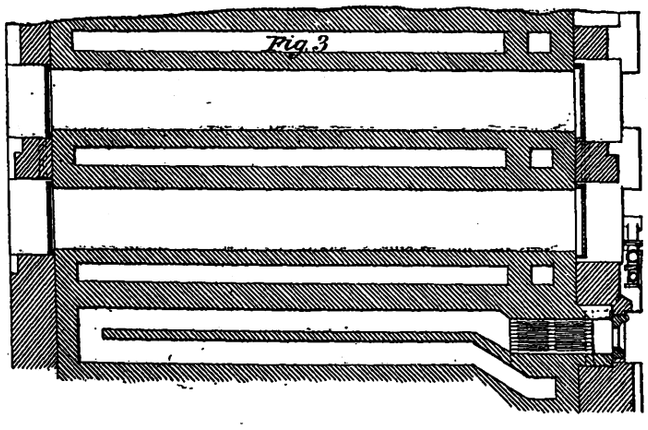
TABLE SHOWING RESISTANCE TO CRUSHING OF SIX DIFFERENT KINDS OF COKE, EXPERIMENTED ON BY M. JOUGUET IN 1880, AT THE BESSEGES WORKS OF THE COMPAGNIE DE TERRENOIRE.

(Resistance per square centimeter in kilos.):

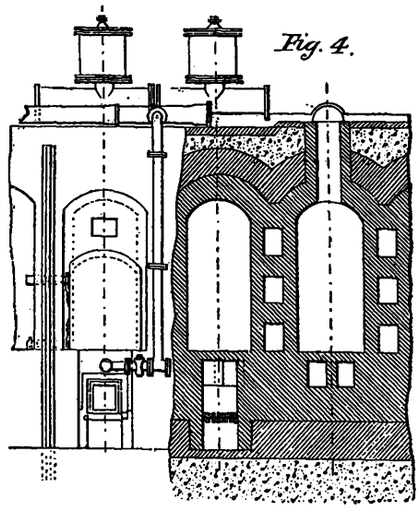
1.	Coke	from	Carvés	ovens	of	70	centimeters	width (27 9-16	inches)	66·46 kilos.
2.	"		"	"		66	"	" (26	")	79·72 "
3.	"		"	"		50	"	" (19 11-16	")	92·32 "
4.	"		Bee-hive	"		50	"	" (19 11-16	")	43·92 "
5.	"		Belgian	"		50	"	" (19 11-16	")	53·12 "
6.	"		Coppée	"		50	"	" (19 11-16	")	80·50 "

Nos. 1 to 3 show clearly that the hardness of the coke increases as the width of the oven (or the thickness of the layer of coal treated) decreases. This result is ascribed to the more intense heat to which the coal or coke is subjected by being, in narrow ovens, on an average nearer to the flues in the vertical walls of the ovens. It is indeed clear that, when a large quantity of coal is heated in an oven, a considerable time will elapse before it all can become heated to the same degree, and that during that time the process of coking will be carried on at different temperatures in different portions of the whole mass; and it seems equally clear that it is easier to obtain regular results with a thinner layer of coal, which can be more readily penetrated by the heat, and maintained at the desired temperature. Experience has shown that not only the density but also the yield of coke is benefited by this reduction in width. The greater vertical dimension of the Carvés oven, comparing it with the bee-hive, also has a favorable influence on the average density of the coke. The time required for each charge varies according to the description of coal and the dimensions of the ovens. In the ovens of 2 feet width, a charge is finished every forty-eight hours. In the ovens of 3 feet width, from sixty to seventy-two hours are required. The system secures the whole of the fixed carbon in the coal, say about 75 per cent; much less than this is got by the bee-hive ovens, from 55 to 65 per cent being generally considered a fair yield. Besides the utilization of by-products, the *heat* of the hot gases is in this system, as well as in others, still utilized to a considerable degree.

M. Jouguet states that at the Bessèges works steam is produced to the extent of about 45 pounds and of 4½ atmospheres pressure per hour and per ton of coal coked; and that under more favorable circumstances 59 pounds of steam should be obtained; that is to say, taking about 17¼ pounds of steam as necessary to produce one horse-power per hour, as at Bessèges, 1400 kilos (3080 pounds) of coal are carbonized per oven and per twenty-four hours. Each oven gives about 3¾ horse-power of motive power, and could be driven to give about 4⅝ horse-power. At Bessèges, all the machinery required in the manufacture of coke and its by-products is now driven by steam raised in this way, and there remains a large surplus, which is used in the blowing-engines for the Bessemer process, for lifting charges to furnaces, etc.



THE Delaware, Lackawanna & Western road has been opened for through traffic from New York to Buffalo. Officials of the company state that full schedule rates will be maintained. It is reported that the company will extend its Lackawanna & Bloomsburg Division from Northumberland, Pa., into the Clearfield region, and will also build a line between Wilkes-Barre and Scranton.



THE DEPHOSPHORIZATION OF PIG-IRON.

Under date of May 22d, the Patent-Office has granted Mr. James Henderson, of Bellefonte, Pa., a patent on the dephosphorization of pig-iron, from which we abstract the following:

The object of this invention is to free crude iron of phosphorus by an economical operation; and to this end the invention consists of a process comprising the following operations, namely, first, the decarbonization of the crude iron, in whole or in part, by the action of air upon it while in a liquid condition; second, the treatment of the partially or wholly decarbonized iron, while in the liquid or molten condition, with a calcareous reagent and an oxide of iron, as more fully herein set forth.

The crude iron to be treated is by preference melted in a cupola-furnace, such as is used for melting pig-iron in the manufacture of Bessemer steel. The melted iron is run into a Bessemer converter, which may be lined with the usual siliceous lining, commonly called "ganister." The air is blown into the melted metal in the converter in the usual manner practiced in the Bessemer process for decarbonizing the metal. The operation is continued by preference to the end of what is called the "third period" or "after the boil," at which time the carbon in the iron is reduced to about one per cent; but the operation may be continued to the "end of the blowing," when, practically, all of the carbon is removed. The decarbonized iron thus obtained is transferred to a ladle with a hole in the bottom, closed with a plug-stopper, and is permitted to run from the said hole into a spout which delivers it into the hearth of a reverberatory furnace, which is capable of being heated to the melting-point of wrought-iron, or higher. The kind of reverberatory furnace which I prefer to use for this purpose is a gas-furnace constructed with a revolving movable hearth which is capable of being revolved upon an upright axis when in the furnace, and of being applied to and removed therefrom, the fuel used in said furnace being preferably the gases evolved by the combustion of bituminous coal, which is burned by means of jets of heated air. The metal is heated in said furnace in contact with the basic reagents for a short period—say from ten to thirty minutes—when the lime is in the condition of fluor-spar, depending upon the smaller or larger portion of carbon remaining in the iron at the time of its introduction into the furnace; after which, a sufficient quantity of compounds of carbon, iron, and manganese—as spiegeleisen or ferro-manganese—is added to it for the purpose of recarbonizing the metal, as in practicing the Bessemer process. Then the metal is permitted to run from the furnace, and is cast into ingots in suitable molds.

Fig. 3.

Fig. 4.

The preferred mode of applying the reagents is to spread the compound of them upon the hearth of the furnace before the melted decarbonized metal is permitted to run into the furnace, and also to heat the compound until it becomes viscid; and I prefer that the hearth of the furnace should, previous to use, be lined with lime or other calcareous material, or with magnesia, or iron plates, as described in my English Patent No. 1051 of 1870, and in my United States Patent No. 106,365. By thus protecting the metal and the reagents from contact with silica, it is found that the work is accomplished better.

I prefer that the lime of the basic reagents shall be in the condition of fluor-spar, and that the oxide of iron shall be in the form of titaniferous iron ore, and that the relative proportions of the two shall be forty parts, by weight, of fluor-spar to one hundred parts, by weight, of titaniferous iron ore. The proportions of the reagents to be used may, however, be varied, and will depend upon the quantity of phosphorus present in the metal. If, for example, the phosphorus present is one per cent of the metal, the amount of fluor-spar and titaniferous iron ore required will be about three hundred-weight of the mixture of the two to one ton of steel; and if the phosphorus be present in less quantity, the quantity of the mixture of the reagents may be correspondingly reduced.

The reagents above described may be replaced by their substitutes. Thus, caustic lime or limestone may be substituted for fluor-spar weight for weight, and the titaniferous iron ore may be replaced by rich magnetic oxides or hematites as free from silica, sulphur, and phosphorus as possible. The use of an oxide of iron in conjunction with fluor-spar or its equivalent is deemed preferable to either fluor-spar or oxide of iron separately. When combined in use, the reaction will proceed more energetically, with a corresponding economy of time and saving in cost. The oxide of iron also protects the metal measurably from oxidation during the removal of the phosphorus.

The process above described is characterized by the dephosphorization of the iron after its decarbonization, and this is important, because if

Digitized by Google

lime in the form of fluor-spar should be introduced into the metal while in the converter before decarbonization, the fluorine of the fluor-spar, by combining with a portion of the silicon of the iron, and carrying it off in vapor or in gas, would rob the metal of a substance (silicon) whose combustion by the blast is important for the purpose of keeping the melted metal at the requisite temperature, and the practical result would be the reduction of the temperature of the metal so low as to render the operation of casting it difficult. If, on the other hand, as above provided for, the metal be subjected to the action of the purifying reagent after the silicon has been consumed in the process of decarbonization, the temperature of the metal will not be reduced by the action of the purifying agent to any practical extent.

The additional heat applied to the melted metal in the reverberatory furnace during the treatment is advantageous. It obviates the risk of the metal becoming cooled by the too prolonged detention in the vessel in which it is treated, and also supplies the requisite heat to maintain the metal in a melted condition in case the heat which is inherent in it previous to treatment is not sufficient for that purpose.

It is understood that the operation of decarbonization, as carried on in a Bessemer converter, by means of injected jets of air, as above set forth, is attended with the desiliconizing of the metal, whereby the metal is substantially free from silicon, silicates, silicic acid, the presence of which would seriously interfere with the succeeding dephosphorizing operation.

What is claimed is—

1. The improvement in the art of manufacturing iron and steel, which consists in first decarbonizing the metal, while in a molten condition, by means of jets of air, and afterward treating the decarbonized metal, while free from contact with siliceous substances—such as the lining of the containing-vessel—with a calcareous reagent and oxide of iron, to remove the phosphorus.

2. The improvement in the art of manufacturing iron and steel, which consists in first decarbonizing the metal, while in a molten condition, by means of jets of air, and afterward treating the decarbonized metal with a calcareous reagent and oxide of iron, while the metal is maintained in in a liquid condition by the application of additional heat.

3. The improvement in the art of manufacturing iron and steel, which consists in first decarbonizing the metal, while in a molten condition, by means of jets of air, and afterward treating the decarbonized metal with a calcareous reagent and oxide of iron, to remove the phosphorus.

THE BASIC PROCESS AT STEELTON.

The *Bulletin* of the American Iron and Steel Association contains the following announcement in reference to the introduction of the basic process, the first news of which was published in the ENGINEERING AND MINING JOURNAL of May 5th:

The Pennsylvania Steel Company, having found it unnecessary to work its original Bessemer plant, on account of the large product of its new three-converter plant, determined to make a test of the basic process, and accordingly began two or three months ago to make such alterations in the old plant as would suffice to give the new process a practical test. The alterations consist principally of the change of a cupola into a calcining kiln for calcining the dolomite, arrangements for preparing the dolomite for use, and the molds requisite for putting the dolomite into place in the cupolas and converters. The preparations having been completed, a start was made on Monday, May 7th, 1883, and the first heat of basic steel ever made in this country was a decided success, the steel showing excellent physical tests, and was suitable for boiler plate, although not so low in phosphorus as other heats made later with a longer "overblow."

The dolomite was obtained from the extensive deposits at Chickies, Lancaster County, Pa., and the lime for the "additions" was from the immediate vicinity of the works. The pig-iron used was made at the Lochiel Furnace, under the supervision of the Pennsylvania Steel Company, of puddling-furnace cinder and South Mountain ores, and contained of manganese and phosphorus each about 2½ per cent, and of silicon about one per cent, being principally mottled in grade.

The process has continued regularly every day, and with very encouraging results. It may be expected that various difficulties and drawbacks will appear in time, as is usually the case in such experiments; but so far, the results have been very good. The steel has been subjected to very severe flanging and punching tests, and shows great fitness for many purposes, according to the carbonization obtained, in some respects excelling any former product at the works.

The Pennsylvania Steel Company is to be congratulated on this successful introduction of a process so important in its relations to our future history.

The editor of the *Bulletin* adds: Several specimens of the steel described above have been sent to the Philadelphia office of the Pennsylvania Steel Company, No. 208 South Fourth street, where we have had the pleasure of examining them. There are several bars, which have been broken, to exhibit in the fracture the characteristics of the steel. It presents a handsome appearance, fully equal to that of steel made by any other method. The label on one of the bars, which was taken from heat No. 1, states that the pig-iron from which this steel was made was smelted from one half puddling-furnace cinder and one half iron ore from South Mountain, Cumberland County, Pa.; the pig-iron contained 2½ per cent of phosphorus, 2½ per cent of manganese, and 1 per cent of silicon; the steel contained 0·04 per cent of phosphorus, 0·275 per cent of manganese, and 0·29 per cent of carbon. Some flat bars shown had been plunged in water when hot and then bent cold and hammered down flat without showing any fracture. But perhaps the finest sample on exhibition is a plate flanged hot, on which the flange is as perfect as if the material had been the best charcoal hammered plate iron. In other parts of the plate, holes were cold-punched without cracking the plate in the least, and in one case two holes were punched within one sixteenth of an inch of each other without cracking the intervening steel. These tests show very clearly the excellent quality of the basic steel made by the Pennsylvania Steel Company, and demonstrate that, so far as chemical and mechanical results are concerned, the basic process is a complete success.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

RECENT RULINGS OF THE GENERAL LAND-OFFICE.

Patents for Relocated Placer Claims.—"A" made application for sixty acres of placer ground in 1874; publication was duly made in June of the same year. Within the sixty days of publication, "B" filed a protest and adverse claim, basing it on priority of possession to about twenty acres. The courts rendered judgment in favor of adverse claimants. "B" subsequently abandoned the twenty acres, and afterward "C" relocated this abandoned portion. "D," the present applicant for patent, is now shown to be in possession of the entire sixty acres as originally applied for, having obtained his title by a chain of conveyances from the original locators, by sheriffs' deeds, and conveyances from the relocators of the abandoned portion. Now "D" proceeds under the application of "A" to obtain patent, and upon this statement of facts the Commissioner of the General Land-Office comments: "In the opinion of this office, this procedure of 'D' is irregular. His title to the twenty acres is through adverse interests and a relocation of property formally awarded to 'B.' Other persons may claim title also by virtue of a relocation, and the only way they could assert their rights would be under a new publication for that portion of the ground obtained by 'D' through the relocation of 'C,' and the filing by such persons of their adverse claim during the period thereof." In order to protect the rights of all parties, the commissioner is of the opinion that the entry of the present applicant "D" be canceled to the extent above mentioned, that is, for the twenty acres.

Fraudulent Coal Land Patents.—A patent for coal lands which a patentee obtains by falsely representing in his proofs that the same are agricultural in character is void, and will be canceled when the facts are properly brought before a court of competent jurisdiction. In all cases, however, the presumption is in favor of the regularity of the proceedings which led to the issuance of the patent, and the verity of the record can not be overcome by a mere statement "that at the time of location there was a vein of coal clearly observable cropping out on the surface." It is not the province of the General Land-Office to decide as to the validity of a patent in such a case.

Mining Claims in Unconfirmed Mexican Land Grants.—When the question was asked Whether a Surveyor-General would be authorized in surveying a mining claim within the boundaries of an unconfirmed Mexican grant, which grant had been reported to Congress for its action thereon, the reply was, after quoting the act of July 22d, 1854, and section 2319 of the Revised Statutes and the treaty of Guadalupe Hidalgo, that it has always been the policy of the General Land-Office to treat lands in this condition as reserved not only from sale but from exploration and location by mineral claimants.

Relocation of Abandoned Mining Claims.—When a mining claim is abandoned subsequent to publication and prior to entry and payment, a case would be presented in which the executive department would be compelled to take jurisdiction, because the law under that state of facts allows the abandoned land to be again located by any qualified person in the same manner as if no location of the same had been made, and makes no provision for the determination elsewhere of any question or controversy arising out of this class of conflicting claims.

Annual Improvements.—The fact that large expenditures have been at some prior period made upon a mining claim does not excuse the claimant from the necessity of complying with the law in making annual improvements or performing annual labor.

Appeals from Decisions of Local Offices.—When a mine claimant does not appeal from the decision of the local office adverse to him, the decision is not necessarily final. Where a party contestant, against whom a decision is rendered by the local officer, fails to appeal, the decision is regarded as final as to the facts, under the rules; but it is no violation of the rules in such cases for the Commissioner of the General Land-Office to set aside the decision of the local officers on account of conclusions reached under statutory provisions, such a course being pointed out and authorized by rule of practice No. 47, Subdivision 2.

A NEW PLAN OF UTILIZING BLAST-FURNACE SLAG.

Mr. A. D. Elbers, of Hoboken, N. J., who was prominently identified with the utilization of blast-furnace slag in the manufacture of mineral wool, has come forward recently with a plan for the conversion of mineral wool into silicates previously desulphurized, to be used in the manufacture of china cement, pigments, and absorbents. Mr. Elbers gives the following details in regard to his method, a patent for which has been applied for:

The suitable raw material is uni-silicate or neutral slag, the composition of which contains the usual percentage of sulphur in soluble compounds. The first and well-known operation is the reduction of the slag to a finely fibrous condition, by subjecting it, while in the fluid state, to jets of steam. While the steam divides the fiery mass into fibers, it also slightly reacts chemically on the sulphur compounds, whereby the fibers become predisposed to further reduction. The second operation is the roasting of the now fibrous and very voluminous slag, until no further evolution of sulphurous acid vapors takes place, whereby the opening of the fibers and the reuniting or fritting together of their constituents—freed from sulphur—is accomplished. The fibrous slag has been changed to a granular substance of purified composition; if the heat is increased after this change has taken place, the result will be a fused mass of desulphurized slag; and if too much heat is applied before desulphurization, the fibers will be re-melted into fused slag of the original composition.

A Hessian crucible is filled with the wool, and is then placed in the fresh-glowing coal fire of a stove or range, and allowed to remain there about an hour. It will then be found to contain, beginning at the bottom:

1st. Fused desulphurized slag, forming the crust of:
2d. A fritted porcelain-like mass, often spotted with iron oxides.
3d. A mass of whitish, soft silicate, containing some impurities.
4th. Greenish, sensibly sulphurous, partly opened silicates.
5th. A spongy, dark mass, in which the fibers are yet discernible.
6th. On top: nearly unchanged mineral wool.

By re-heating No. 4, No. 3 is obtained; Nos. 5 and 6 may be reduced in the same ratio; and if the heat is just sufficient, the whole charge may be

Digitized by Google

converted in one heat to the most desirable condition, which for most purposes is that of the No. 3 specimen.

This desulphurized and easily friable silicate is finely pulverized, and after being purified by washing, is then ready for use in the arts, as slag-silicate of lime, alumina, and magnesia. Its color, according to Mr. Elbers, is white; if it has a darker shade, it may not have been thoroughly desulphurized, as the testing with acid will show. Mixed with water only, the silicate may be cast in molds, but it will scarcely be sufficiently plastic to be formed by hand, unless clay is added. The plasticity of the silicate may, however, be brought to a high degree after treatment with diluted sulphuric acid, and if the acid solution is not used to excess, it is presumable that its chemical action will be mainly confined to the formation of sulphate of lime and to the proportionate setting free of silica. For quick preparation, the silicate is sparingly moistened with a strong solution of four parts by weight of water to one part of acid, when the formation of sulphate of lime is readily noticed. After slight stirring and quick washing with more water, the latter is drawn off until the mixture becomes lusterless and apparently nearly dry. It is then ground for about a minute in a mortar, the luster reappears, the mass becomes viscid, like putty, and can then be formed and air-dried at ordinary temperature. If the mass contains unneutralized acid, is put away for weeks, then broken up, soaked in pure water and worked over, its plasticity and fineness have increased. The hard-fritted and the partly fused specimens (No. 1 and No. 2) are not easily attacked by acids, but after mixing in finely ground or sand-like condition, cementation will set in gradually and the mass will become very hard.

THE COPPER INDUSTRY OF FRANCE.

M. Paul Trasenter, the eminent physician of Liége, sends us the following table of the official statistics of the copper industry in France, it being, we believe, the first time that the data referred to have been gathered in so complete and comprehensive a form. It is unfortunate that the plan of collecting these statistics has been repeatedly changed; but M. Trasenter's notes bring order into the chaos. As for the ore mined, the figures include the French and Algerian mines. From 1861 to 1869, inclusive, the poor pyrites of Chessy and Saint-Bel in the department of the Rhine have been included; but they can not really be considered copper ores, and the third column shows that they were not worked for copper. The columns giving the imports of copper and iron unfortunately jumble both together; for later years, they appear to be the aggregate of imports of black copper and of ores. Until 1878, the figures for the production include the output of those works which produced manufactured copper from imported ingot. During the three years 1876 to 1878, the production of brass was not ascertained, and since 1879 the official French statistics only include the product of actual metallurgical operations; that is, the metals abstracted from ores and mattes received from Chili and other countries. With these explanations, the official statistics will be better understood:

	Production of French Mines.			Imports.		Products Worked.	
Year.	No. of workmen.	Ore mined. Tons.	Worked for copper. Tons.	Raw copper. Tons.	Ore. Tons.	Copper Tons.	Brass, etc. Tons.
	1.	2.	3.	4.	5.	6.	7.

* And 730 tons matte.

M. Trasenter, by carefully going over the figures since 1869, has compiled the following estimate of the production of copper in France, including that from foreign mattes. The column for ores in 1880 and 1881 includes about 7000 tons of poor ores from the Alps Maritimes:

Year.	Production of ore, tons.	Production of copper, tons.
1869	490	1 500
1870	688	2,100
1871	1,492	2,720
1872	1,491	2,600
1873	2,432	2,140
1874	6,008	2,000
1875	8,698	2,300
1876	7,724	2,230
1877	6,306	2,330
1878	2,668	3,500
1879	548	3,350
1880	8,649	3,300
1881	8,170	3,395

DRIVEN-WELL PATENTS.

The Federal Court of Des Moines, Iowa, on the 19th inst., rendered an opinion on the question of the validity of Nelson W. Green's driven-well patent, a case that has been pending for some time. The court holds that there are two well-established instances of prior use of the principle involved in this patent, one of them being at Independence, Iowa, where a well was sunk in the early summer of 1861, and the other at Milwaukee, where a large number of them were put down as early as 1849, the patent to Green not having been issued till 1868, and the application of the principle not having been discovered and put into use by him until after the well at Independence was proved a success. The court holds that Colonel Green made no effort to prevent the use of his discovery by the public for about seven years, and it is upon this showing, more than the fact that the Iowa and Wisconsin wells antedated Colonel Green's discovery and application of the principle, that the patent is held void. The court also held that the issue was void for the reason that it set out a broader claim than was contained in the original patent. Over three hundred actions, principally against farmers, for damages, were pending in this court on this patent. Many more had confessed judgment and settled at heavy costs, and still others had paid the royalty exacted by the drive-well agents, who, a few years ago, swarmed over the Iowa prairies hunting up causes for action. So annoying had these persecutions become that a defensive alliance of farmers was formed, and many defended their premises with shot-guns against the incursions of drive-well agents, and in several instances mob law was threatened. The result was an appeal to the courts, with the result as announced. If sustained by the Supreme Court, the farmers of the Northwest will have gained a signal victory over a hitherto most exacting monopoly.

At the recent hearing in Iowa, Judge Nelson, of the United States Circuit Court of Minnesota, and Judge Love, of the United States Circuit Court for the Northern District of Iowa, sat with Judge Shiras. Judge Love concurred in Judge Shiras's decision and Judge Nelson dissented. The appeal will not bring these cases before the Supreme Court of the United States for the first time. When the hearing in Iowa began, an appeal taken by the farmers from a decision made by Judge Gresham, of Indiana (now Postmaster-General), was pending in Washington, the case being that of Wahl *against* Hine. Only eight of the Supreme Court justices sat at the hearing of that appeal. The court was equally divided, four justices being on one side and four on the other, so that the Supreme Court must try again. An appeal from the New Jersey District will probably be reached before the appeal which will go up from Iowa. In the mean time, the patentee's application for an injunction prohibiting the Indiana farmers from using their wells has been denied. The conclusions of fact found by Judge Shiras are these: That Colonel Green, in 1861, being then in command of the Seventy-sixth Regiment of New York Infantry, put his method of driving wells into public use, for the benefit of his regiment, thereby abandoning his invention to the public; and that his invention was in open and public use, with his knowledge and acquiescence, for more than four years before he applied for a patent thereon. In these four years the public acquired rights through the open and uninterrupted use of the discovery. Judge Shiras holds that it necessarily follows from these conclusions of fact that both the original and reissued letters patent are invalid and void.

A NEW FIRE-PROOF MATERIAL.

The *Manufacturer and Builder* prints the following: Our attention has lately been drawn, by reason of some quite remarkable tests of its efficiency, to a new and, in many respects, novel fire-proof material, adapted to a great variety of uses, which is manufactured by the Magneso-Calcite Fire-Proof Company, of Boston, Mass. The company takes its name from that which it has adopted to describe its fire-proof composition. From the nature of the materials which it proposes to use, and its methods of applying them, we are not surprised to learn that the company has succeeded in producing a fire-proof material of decided merit.

Of the varied uses and applications of a material, thoroughly fire-resistant and susceptible of being produced in any shapes or forms that may be desired, quite an article might be written. But it will suffice for our purpose here to enumerate simply some of the more prominent of these. The most obvious and pressing need of a material that shall be thoroughly fire-proof is for the lining of safes and similar receptacles of various sizes and shapes intended for the preservation of money, bonds, deeds, important documents, diamonds, jewelry, and other valuables. In addition to the foregoing, there is a wide field of utility open for a heat-resisting material that can be adapted to miscellaneous uses in rendering buildings more secure against fire. Among these uses may be mentioned the lining of floors, shutters, partitions, elevator shafts and hallways, boiler rooms in mills, factories, steamboats, etc., and similar uses too numerous to mention. And it goes without saying, as the French put it, that a fire-proof material that is not too expensive, that is susceptible of being produced in such shapes and forms as to be applicable to all these and other uses, and that will answer its intended purpose efficiently, is an eminently useful material. Such a material, accomplishing not only all these objects, but many others not enumerated above, cheaply and effectively, the manufacturers of the so-called "magneso-calcite fire-proof material" claim to produce, and in substantiation of their claim present a very convincing array of testimony.

We prefer in our references to the material, however, to base our remarks on the character of the material itself, preferring to let this tell its own story. The so-called magneso-calcite material is prepared by treating finely fibrous asbestos, slag-wool, or other fibrous and incombustible materials, by suitable methods of impregnation, either wet or dry, with a cementing substance composed of a mixture of lime and magnesia (whence its name), and a silicate of soda, or its equivalent, and then subjecting the material in suitable forms to more or less pressure. The resulting product is a combination of non-combustible materials, which, when ready for use, takes the form of a hard board of any desired size and thickness, both sides of

Digitized by Google

which are covered with asbestos cloth. Any desired number of these boards are then joined together by a fire-proof cement of magneso-calcite and silicate, the whole forming both a heat-insulating and a fire-resisting body susceptible of the most diverse applications. As nothing but incombustible substances are employed as the basis of this product, the cementing material (magnesia and lime) being principally composed of the most refractory materials known to science, there can be no question that the product is thoroughly fire-resistant; and as these materials are at the same time excellent non-conductors of heat, the product must be to an eminent degree also an insulator of heat.

The company engaged in the manufacture of this product applies it to the construction of fire-proof receptacles of great variety, such as fire-proof safes and safety-boxes, express chests, bond, note, and jewelry cases, and the like, for which, in addition to economy of weight and space, it claims a very superior degree of protection. As an example, it specifies that one of its safes, standing 35 inches high and weighing only 650 pounds, corresponds in interior space with the ordinary cement-lined safe 45 inches high and weighing 1300 pounds.

In addition to the application of the material to the special branch of manufacture just mentioned, the company recommends, and is applying it, as a lining for vaults, shutters, partitions, elevator shafts, and hallways; for incasing boilers, fire-rooms in dwellings, stores, and steamboats; covering steam pipes, etc., for all of which uses its eminent fire-resisting and heat-insulating qualities, and its adaptalbiity to be readily produced in any desired or required form or shape, enable it to be used with advantage.

GEOLOGICAL NOMENCLATURE AND COLORING.

The following stratigraphical divisions have been provisionally adopted by the International Commission of the Geological Map of Europe. The colors placed against them are those proposed by the directors:

1. Gneiss and protogine. Bright rose-red.
2. Crystalline schists (mica-schists, talc and chlorite schists, amphibole schists, and foliated gneiss). Medium rose-red.
3. Phyllites (argillaceous schists, Urthon-schiefer). Pale rose-red.
4. Cambrian (all fossiliferous beds below the Llandeilo flags; primordial fauna, Taconic). Reddish gray.
5. Silurian, lower fauna (second of Barrande). Dark silk-green.
6. Silurian, upper fauna (third of Barrande). Light silk-green.
7. Devonian, lower. Dark green-brown.
8. Devonian, middle (limestone of the Eifel). Medium green-brown.
9. Devonian, upper. Light green-brown.
10. Carboniferous, lower (culm, mountain limestone, etc.). Blue-gray.
11. Carboniferous, upper (houllier, millstone-grit, etc.). Gray.
12. Permian (dyas), lower (Rothliegendes, etc.). Burnt sienna.
13. Permian (dyas), upper (Zechstein and equivalents). Sepia.
14. Trias, lower (grès bigarré). Dark violet.
15. Trias, middle (Muschelkalk). Medium violet.
16. Trias, upper (Keuper and equivalents). Light violet.

16'. *Rhetic*, provisionally (Hauptdolomit excluded).

17. Jurassic, lower (lias). Dark blue.
18. Jurassic, middle (Dogger, kellovien included). Medium blue.
19. Jurassic, upper (Malm with tithonic and Purbeck). Light blue.
20. Cretaceous, lower (Neocomien and Wealdian). Dark green.

20'. *Gault*, provisionally.

21. Cretaceous, upper (from the cenomanien). Light green.
22. Eocene (nummulitic, etc.). Orange-yellow.

22'. *Flysch*, provisionally.

23. Oligocene (with the aquitanien). Dark yellow.
24. Miocene (Mollasse). Medium yellow.
25. Pliocene. Light yellow.
26. Diluvium. Naples yellow.
27. Alluvium. White.

The subdivisions "Rhetic," "Gault," and "Flysch," whose affinities are doubtful, will be figured separately in the preparatory work, so that they can finally be joined either to the upper or lower formation, according to the decision reached by the commission of nomenclature.

MR. JOHN H. JONES, the official accountant, has published the following very interesting statement, showing the general distribution of anthracite coal in the year 1882:

	Tons.
To Pennsylvania, New York, and New Jersey	19,057,789
To New England States	5,064,775
To Western United States	2,213,107
To Southern States, including Delaware, Maryland, and the District of Columbia	1,168,730
To Pacific coast	49,065
To Dominion of Canada	616,875
To foreign ports	49,735
	29,120,076

It will be noted that as yet the Western business is comparatively unimportant, so far as the quantity shipped to that quarter is concerned. This year, however, we have every reason to believe will see a very notable increase; in fact, there must be, in order to keep the trade in other sections in a fair condition. It is questioned by many whether the East and South will take their regular quota due to the natural increase in consumption, roughly estimated at 5 per cent per annum, because the prospects for the iron trade and manufacturing generally are poor. The West will therefore have to take care of the tonnage thrown upon the market by the growing production, and upon the marketing of this surplus will depend to a considerable degree the future of the trade this year.

A SHAREHOLDER'S ANSWER TO A CALL.—The secretary of an Indian gold mine, having sent an imperative demand to a certain shareholder for the payment of a "call," received, says *St. Stephen's*, the following reply: "Dear Sir: I have your letter of this date, and note that your directors propose to proceed against me. Your prospectus stated that one of the objects of your company was to 'seek, win, and work gold in India and elsewhere.' Things not turning out well in India, your directors apparently consider it their duty to seek, win, and work gold 'elsewhere'—that is, out of me. I can assure you, however, that I am not in an auriferous vein; the only lode I possess is a load of debt, and as a gold mine I shall be a failure. Your prospectus estimated a yield of one ounce of gold per ton on thirty thousand tons of quartz crushed per annum—£10,500 sterling per annum. You may 'crush' me, but you will find that I will not yield nearly so much. My person (which, for the purposes of this calculation, may be considered quartz) weighs, roughly speaking, ten stone, and, if crushed immediately, I estimate that it would yield as under—Gold *nil*, silver 3s., copper 4½d.—total, 3s. 4½d. Deduct cost of crushing—say, £5 5s. Yours faithfully, ——."

FURNACE, MILL, AND FACTORY.

The stockholders of the Palmer, Mass., Wire Company have voted to increase the capital stock from $100,000 to $150,000, the original stockholders having the privilege to take the new at par. The company is overrun with orders, and the mill is busy night and day.

The Novelty Foundry Company, says the Youngstown (Ohio) *Register*, is the name of a new company which is engaged in perfecting an organization, and it is the intention to begin active operations the coming week. Among those engaged in the enterprise are Messrs. John Sampson, S. L. Clark, J. C. Brenneman, M. E. Rice, and F. W. Clark. The company is located on East Federal street, occupying property formerly held by Jones & Claypool. It proposes manufacturing all kinds of iron and brass castings, car-wheels, and coal-bank cars. Mr. M. E. Rice, a practical man of many years' experience, will be superintendent of the works.

On the 13th of June, the Gaylord Rolling-Mill at Portsmouth is to be sold at public sale. The Ashland (Ky.) *Independent* says that there is a movement on foot to procure its removal to that city, and it is among the probabilities that this will be done.

The Tod furnace, owned by the Brier Hill Iron and Coal Company, Ohio, which is relining, will be put in blast early in June, if the state of trade warrants it.

The sheet-iron department of the Ward mill, Ohio, at New Philadelphia, has been placed in operation. William E. Ward, of Niles, is manager of the new mill.

The Johnstown *Tribune* says: Mr. Frederick Krebs, Jr., Superintendent of the Gautier Steel-Works, has in his office a steel knot which will excite the admiration of the more intelligent and practical visitors at the Great Railroad Exposition, now opened at Chicago. The steel is round, and one inch and an eighth in diameter. To turn, twist, and tie it was no easy task. Mr. Benjamin Hinchman, one of Mr. Krebs's assistants, was given the work to do, and after some study he succeeded in rigging up a machine which took the rod and tied it into a very pretty knot, tightly drawn—the knot being seven or eight inches long and four or five inches through. This was a very severe test of the quality of the steel, but it stood it without the slightest crack appearing on its surface.

The *Bulletin* is informed that on the 17th of last month the Pennsylvania Steel Company's rail-mill made an unusually large run. During the twenty-four hours, 681 gross tons of 60-pound steel rails were rolled; and during twelve hours of the same day, 356 tons were rolled. The last turn of eight hours rolled 240 tons. The daily average for the week was over 614 tons. The average daily production of Bessemer steel ingots in the same week was 797 gross tons, while the largest twenty-four hours' run was 820 tons. One turn of twelve hours produced 458 tons of ingots.

The Dickson Manufacturing Company, of Scranton, has been awarded the contract to furnish the Calumet & Hecla Mining Company, of Lake Superior, Mich., with a steel boiler 90 inches in diameter, 36 feet in length, and to carry 150 pounds pressure. The total weight of this boiler will be 108,000 pounds, and the castings for it will weigh 10 tons. It will have 199 3-inch tubes. It is to be made of ¾-inch steel plate furnished by the mining company to the Dickson Manufacturing Company, after testing every plate prior to delivery. The boiler was designed by Mr. E. D. Leavitt, Jr., of Cambridgeport, Mass.

The Pennsylvania Graphite Works, at Byer's Station, on the Pickering Valley Railroad, owned by the Messrs. Young, of Reading, which have been standing idle for several months, are to be put in operation again about the 1st of June. The company disposed of its works some time ago, and since then they have been in litigation. Matters have now been settled, and the works will soon be put in operation.

At San José, the sheriff sold the Guadalupe quicksilver mine on the 8th inst., to satisfy the judgment recently obtained by Flood *et al.*, executors of the last will of William O'Brien, deceased, in the Superior Court. Sixteen thousand shares of the capital stock brought 3-1000 of a cent per share. The first parcel of land, containing 1109·67 acres, brought $100,000. The second parcel, containing 1032 acres, brought $25,000. Total purchase-money, $125,048. Marie Coleman was the purchaser. The sheriff's costs and commissions amount to $1299.98.

The large "coke-pusher," building at Scott Foundry, Reading, for Robert H. Powel, Powelton, is nearly finished, and temporary shedding has been erected in the yard of the works, under which the machinery is being put together. The coke-pusher will be operated by two engines. A blowing-engine for the Powelton Furnace is also building at the Scott Works.

The Colliau Furnace Company, of Detroit, has now about 100 of its cupolas at work. They are now used by the Michigan Car-Wheel Company, of Detroit; the Pullman Car-Wheel Company, of Pullman, Ill., and a number of other establishments.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY.

A dispatch from Tombstone, dated May 21st, says: The Copper Prince Mining Company has closed its case against the Copper Queen in the District Court. The defense will occupy most of the present week. Experts Rolker and Blake, of New York, are on the case. Copper Prince miners began to work on Copper Queen ground Saturday night, in order to prove the dip of the ledge, but were ejected by force of arms.

A dispatch dated May 24th, says that in the case of the Copper Prince against the Copper Queen Mining Company the jury gave a verdict for the plaintiff. A stay of proceedings for sixty days has been granted, pending a motion for a new trial.

The Copper Queen product for May will probably be about 350 tons of copper.

Digitized by Google

TOMBSTONE DISTRICT.

GIRARD.—Messrs. Disston and Lloyd, from Philadelphia, principal owners of this mine, are at Tombstone, preparing to start up work in the mine and mill again.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended May 12th shows: Ore crushed, 163·44 tons; average assay value of pulp, $36.66 per ton; of tailings, $4.65. West cross-cut, 1000 level, is 226 feet long. North drift from east cross-cut, same level, is 116 feet long. North drift, 800 level, is in 446 feet. Winze No. 5 is 16 feet deep, and the vein in the bottom is somewhat better concentrated than where the winze was started. North drift from winze No. 6, 672 level, is 135 feet long, and south drift from same winze, at the 640 level, is 100 feet long.

STANDARD.—An accident at the mill May 17th completely ruined the engine. It will take a month to replace the engine. The Standard-Bulwer Mill is running regularly on Standard ore. A later dispatch says that a temporary engine is to be placed in the Standard mill, and crushing will be resumed within a week. For the week ended May 23d, 1203 tons of ore were extracted. The vein in the 1000 level is 2¼ feet wide and looks well. The upper levels yield the usual quantity of ore. The Standard mill has resumed crushing.

CANADA.

PROVINCE OF MANITOBA.

BRITISH AMERICAN.—Miners are already engaged and are prepared to go to work as soon as navigation opens.

MANITOBA CONSOLIDATED.—Work is progressing favorably, but only a small force of men are at present employed.

RABBIT MOUNTAIN.—The stamp-mill will be in operation shortly. Operations at the mines are pushed vigorously.

NOVA SCOTIA.

OXFORD.—Mr. Frederick De Camp has been appointed general manager and superintendent of this company, whose properties are situated at East Chezzetcook. The company is now prospecting for another rich lode, of which there are indications in the locality of their present workings.

ONTARIO.

WALLB RIDGE.—Mr. William Coe, of Madoc, has purchased this hematite mine from the Bethlehem Iron Company.

COLORADO.

CLEAR CREEK COUNTY.

From the glowing reports received of the recent strike of carbonates on Lincoln Mountain, we learn that some of the ore is so rich in silver that pieces roasted in a camp-fire and allowed to cool were covered with fine silver globules. On the mountain, in places where trees had been blown down, large chunks of ore were exposed, which would weigh from three to forty pounds. In different places, it crops out of the ground two or three feet. About forty claims are taken up, all showing ore which seems to lie in strata, slanting with the surface of the mountain side. The elevation is about 9000 feet.

BLACK BEAR.—This tunnel has reached the depth of 170 feet. Mill-runs of this ore have been made, showing 600 ounces in silver, 1 ounce gold, and 4 per cent copper. There is now a pay-streak of 10 inches. It is the intention to continue the tunnel to 200 feet and then sink on the vein.

EAST HUKILL.—The mine has now reached 120 feet in depth, and shows a well-defined crevice 5 feet between walls, with a pay-streak of 16 inches. At a depth of 100 feet, levels are run east and west. Mill-runs of the ore give $70 in gold, $45 in silver, with 10 per cent in copper.

MAYFLOWER.—Draining the shaft has begun.

DOLORES COUNTY.

RICO REDUCTION COMPANY.—Repairs and improvements at the lixiviation works are making, and preparations for a season of increasing work are going on.

FREMONT COUNTY.

HUB.—Shipments have been made to Argo of ore which carried as high as seventy per cent copper and from forty to sixty ounces of silver to the ton. There is a large amount of ore now on the dump, and considerable will be shipped during the season. Machinery for the treatment of copper is understood to be on the way, and will be added to the plant of the Cañon City smelter. The mine is only eight miles from the Denver & Rio Grande Railroad and thirty-five miles from Cañon City.

LAND INVESTMENT, COAL AND OIL MINING COMPANY.—A report made to this company shows that the oil as taken from the well presents a uniform gravity of 30° Beaumé. Work on the well is rapidly pushed. The hole is enlarging to 8⅝ inches, and will be run to a depth of 1400 feet. The casing will be placed in position this week, and the tubing and pump next week. Pumping will be begun by the 25th, or at the latest by June.

GILPIN COUNTY.

GOMER.—Work has been resumed. Developments of the vein are made by drifting east from the main shaft at the depths of 60 and 100 feet.

RED CLOUD.—Preparations are making to start up this mine again.

ROLLINS.—The company will begin building a fifty-stamp mill very shortly. The mill will be connected with the Perigo and the company's other mines at Gold Dirt by a tramway three miles in length. The company thinks that the water-power there, available the year around, will more than compensate for the extra cost of transportation. There is ore enough in sight on the Perigo to run the new and the old mill for two years.

WYANDOTTE.—Parties are leasing on the Crawford County mine, the property of this company. Levels are driven both ways from the shaft and backstopes driven.

GUNNISON COUNTY.

MOFFATT SMELTER.—The proprietors are engaged in the construction of sufficient furnace capacity to handle all the ore that will be shipped to Gunnison. The owners say that if necessary they will double the capacity of the largest smelter in the State to accommodate the demands. By June 12th, this smelter will be in full blast. The Bartlett process of utilizing the fumes is used here.

OAKES.—This mine has been sold to Boston parties for $10,000. It is developed by a shaft eighty feet deep and a tunnel 360 feet long.

ROSE & REED.—Reports state that this concentrator will be running within two days.

LAKE COUNTY.

Late Leadville exchanges report the following:

The Hamburg, Lowland Chief, Grand Prize, Curran, and Chemung, all situated upon Breeze Hill, and adjoining the Highland Chief, have recently been consolidated. In the consolidation are Messrs. Tankersley, O'Connor, Billings, Beaudry, and Senator Plumb, of Kansas. This concentration of some of the most promising interests in or about the camp was the result probably of the litigation which has involved the owners for a long time, and which, of course, prevented them from proceeding with the development of their properties. The Hamburg and Curran both show an ordinary grade of mineral and are worked on a lease. The rest of the shafts are in a good contact, and machinery will be placed upon them at once, preparatory to an active campaign.

BROOKLAND.—The suit of the St. Bernard Mining Company against this company, for a temporary injunction, has been denied. Development-work has been resumed, and shipments will soon be commenced.

CLIMAX No. 6.—The lessees have opened up in two drifts in their uprise a body of iron about seven feet in thickness, which averages fifteen ounces in silver and from four to six per cent in lead. Above this iron are five feet of flint or carbonate, which is similar to that carrying the chlorides in the Dolphin and Lee. Both the iron and carbonate lie in the upper contact, between the wash and the porphyry, and are of the same nature as the iron in which the rich ore-bodies in the Montana shaft on the Climax have been found.

HARRISON REDUCTION-WORKS.—The rebuilding of the works, recently destroyed by fire, has been commenced. It is expected that the smelter will be in operation again within sixty days.

LITTLE CHIEF.—The central portion of the property has been leased. The royalty is said to be fifty-two per cent.

IRON SILVER.—Work on the Iron Hat, one of the properties of this company, which has lately been leased, has been commenced. The shaft is clearing up and getting in order. A body of ore eighteen inches thick, which carries sixty ounces silver and forty per cent lead, is exposed in the property.

SILVER CORD COMBINATION.—The report presented at the annual meeting shows the product and the operations of the company for the past year to have been as follows:

Tons of ore produced	34,873
Ounces of silver	561,057
Ounces of gold	3,216
Tons of lead	7,417
Total value of production	$1,009,187.06
Cost of mining	$308,673.75
Cost of smelting	329,406.98
Administration and handling	49,510.40
Total	$687,591.13
Gross profits	$321,595.93
From this amount deduct cost of improvements	14,346.95
Payment floating debt	4,377.23
Incidentals and purchase real estate	7,433 50
Payment outstanding bonds	169,625.00
Payment coupons on bonds	9,821.05
Total	$205,603.73
Cash in treasury April 1st	$115,992.20
Net profits for April	45,028.99
Balance on hand May 1st	$161,021.19
Dividend paid May 2d	90,000.00
Balance	$71,021.19

This shows a cash surplus now on hand of $71,021.19, besides the profits of the present month. The new opening in the mine, including drifts, levels, inclines, winzes, and uprises, shows a total of over 6100 feet. The following gentlemen were elected directors: J. B. Grant, T. S. Wood, B. Burchard, Charles T. Limberg, W. W. Weigley, Charles H. Gross, W. Mitchell McAllister, Robert C. Broadbent, and William A. Dripps.

STONEWALL JACKSON.—The face of the upper drift shows a body of chlorides and galena which has reached a maximum thickness of two feet. Contracts have been made with the Royal Gorge smelter, at Cañon City, and regular shipments will be made from now on. There are several large bodies of low-grade ore known to exist in the mine, and prospecting will be vigorously prosecuted.

SAGUACHE COUNTY.

ESPERANZA.—This mine, on Crystal Hill, is the first discovery of the district. The ore is a manganese, which carries large quantities of free gold. The vein is a fissure, from 12 to 15 feet wide, with side-walls of graphite and porphyry. The workings consist of a shaft 55 to 60 feet deep and an open cut at another place of 30 feet. The ore mill-runs from 5 to 20 ounces gold and from 20 to 100 ounces silver per ton. There are about fifty tons of ore sacked in the ore-houses awaiting shipment.

SUMMIT COUNTY.

COLORADO & NEW MEXICO.—This company has a claim on Mineral Hill, into which it has driven a tunnel 730 feet, and has struck a vein of very rich ore not over a foot in width, which assays high in silver.

GRAND VIEW.—This property, consisting of three claims, is developed by a 49-foot shaft. The ore assays 25 ounces silver and 73 per cent lead. These mines will be worked during the season, and ore will be shipped within a short time.

ROBINSON.—A reporter of the Leadville *Democrat* states that the mine is showing an improved condition. For the month of April, there were shipped ninety-two car-loads of ore. Considerable ore is mined from the seventh and eleventh levels and a small amount from the fifth. The ore from the bottom yielded over 35 ounces to the ton. The cost of transportation and treatment at Argo is $20.50 per ton. This yields, therefore, over mining, smelting, and hauling, from $12 to $15 per ton. The company receives thirty per cent of the smelter's returns, and Mr. Greer, the lessee, from the balance has to pay all expenses. The mine yielded a net profit last month of over $6000, and is now doing much better. Mr. Greer is experimenting by the dry process of concentration on these ores. He expects to ship during this month upward of 1000 tons of ore. The ore from the twelfth level down to the bottom of the lower levels is now all hoisted through the east shaft. The ore from the upper levels is taken out of the tunnel as heretofore. There are sixty-five men employed in the mine, and though there is considerable water coming into the mine, no trouble is anticipated or yet incurred in handling it. The new incline is rapidly driven, three shifts of eight hours each being employed. The incline progresses at the rate of two feet per day.

Digitized by Google

DAKOTA.

The recent floods, caused by the rain-storm and the melting of the snow which had fallen a few days before, damaged much property in and around Deadwood. Several mills along Deadwood Gulch were destroyed, and the damage to the mines, it is stated by a dispatch, can not be repaired for several weeks. The Homestake mine has nine feet of water over it, and all the mines in the neighborhood of Deadwood are shut down. The Garden Gate and South Bend are washed out, and most of the bridges through the country have been swept away. The total loss is reported to be very large.

CALEDONIA.—The superintendent reports for the week ended May 6th: Ore produced, 1025 tons; bullion shipped, 838 ounces. Winze advanced 10 feet; total, 118 feet; looks more encouraging as depth is attained. The stopes are looking fine.

FATHER DE SMET.—The superintendent's report from May 1st to May 8th shows ore extracted from the first, second, and third levels to be 1900 tons. Ore milled, 1950 tons. North end tunnel advanced 6 feet. Tunnel in 890 feet. Golden Gate north header advanced 6 feet. Header in 100 feet.

The superintendent writes, under date of May 14th, as follows: Herewith express company's receipt for Bar No. 158 = 914 ounces gold, the result of run of mill for last half of April. In the beginning of April we began to work in open cuts, supposing the weather would be favorable for such work; but instead of fine weather, we have had more snow than for any month of the year, consequently we have been compelled to get ore from any point where it could be mined the easiest. Every thing about the mine and mill is running well, and we shall do better in May than we did in April. We have some very coarse screens coming from Chicago, which I want to use as soon as the weather is favorable for handling ore cheaply.

NEW YORK & PROVIDENCE.—This mining, milling, and smelting company, recently organized under the laws of the State of New York, with a capital of $200,000, has taken possession of some valuable mining property in the Black Hills, Pactola District. The company owns the May Queen, Black Hawk Nos. 1 and 2, Mammoth, and the Rob Roy. All these claims show up a large body of low-grade ore which can be milled at a profit.

MEXICO.

The Cusihuiriachic Mining Company has ordered of the Rankin, Brayton & Co., Pacific Iron-Works, San Francisco, a 60-inch Howell-White chloridizing furnace, to be delivered on the cars in twenty-one days from the date of order.

According to the Mexican *Financier*, the famous iron deposit in Durango, better known as the Iron Mountain, is about to be systematically worked by a strong American company. The syndicate is composed of Judge Helferstein, of New York, as president, with Governor Francisco Paricio, of Durango, Joseph Knotts, of Iowa, MacManus & Sons, of Chihuahua, and others as associates. It is purposed to erect machinery capable of an output of 300 tons per week, consisting of blast-furnaces, a complete foundry, etc. The mountain is situated a few miles from the city of Durango. An English company has been working a portion of the mountain, but in a limited and unsatisfactory way.

The work on La Estrella and Alta Gracia mines, Pachuca, is pushing. Prospects are reported bright. San Sebastian looks well. The lode is about 2½ yards wide, and the present run of metal assays about $5 to the ton.

BOSTON & MEXICO OIL COMPANY.—This company is the original or pioneer syndicate formed to work the oil-wells at Chapopote, near Tuxpam. The well is down 675 feet, and is progressing at the rate of eight feet daily.

GUADALUPE HACIENDA.—A report read at a recent meeting showed expenditures to date of $200,000.

ROSARIO.—The small steam-engine recently erected is rapidly draining the mine, revealing, as the water is lowered, rich metal, assaying $61 to the ton. The value of the property has rapidly risen.

SANTA GERTRUDIS.—This company, which is reported as about to sink a new perpendicular shaft, is sending its high-grade ore to England for reduction.

SANTA RITA.—A large pump has been put on this mine, to drain it of the heavy accumulation of water. This mine, in the time of the Spaniards, was constantly worked and yielded rich returns, and great expectations are raised that the unwatering will reveal a bonanza.

SENORA CONSOLIDATED MILL AND MINING COMPANY.—From a statement recently published, we take the following: This company was incorporated in 1880, under the laws of the State of New York. Its object was to acquire the titles to four mines situated in Northern Sonora, Mexico, in the Altar District, at the base of the Sombretillo Mountains, about 120 miles south from Tucson, Ariz., and about ten miles from the dividing line between Mexico and Arizona. These mines consist of the Puertesitos, Barrenos, Cumbre, and El Tio. Each mine represents a full mining claim of 2660 feet in length by 666 feet in width. The Puertesitos, Barrenos, Cumbre, and El Tio mines were obtained with perfect title, the boundaries being set up by government officers, and possession given by the official under the laws of Mexico in whom is vested this power. The titles to these mines are therefore perfect. Owing to the death of Mr. Milton S. Latham, the president and principal stockholder of the company, some fifteen months ago, the mines have been badly managed, and work has been suspended for the past year. The difficulties which have heretofore been a ban and impediment to the successful carrying on of the business of the Sonora Consolidated Mill and Mining Company have at last been removed, and the officers of the company present the gratifying intelligence to the stockholders that Mr. Dudley Hoyt, the well-known mining superintendent, has been employed to take charge of the company's property, and is now on his way to the mines to start the mills and proceed to place the mines on a paying basis. Mr. Hoyt has received instructions to make a full report on the mines and what the probabilities are for the future, and publish the same for the benefit of all the stockholders. An official telegram from him, dated May 16th, says that he has examined the company's mines in Sonora. The property is valuable, the ore high grade, and a large amount in sight.

MICHIGAN.

Following is a statement of the iron shipments from the ports of Escanaba, Marquette, and L'Anse from the opening of navigation to Wednesday, May 16th, 1883:

MARQUETTE RANGE.

Mines.	Tons.	Mines.	Tons.
Barnum	1,102	Pittsburg & Lake Superior	1,043
Cambria	1,826	Lake Superior	1,347
Cleveland	509		
Cleveland hematite	2,171	Total	11,054
Jackson	2,466		

MENOMINEE RANGE.

Chapin	13,649	Quinnesec	2,200
Commonwealth	1,868	Vulcan	4,044
Cyclops	1,143	Great Western	1,068
Florence	1,103	Paint River	546
Hewitt	929	Union	144
Ludington	7,486		
Metropolitan	4,947	Total	44,951
Norway	4,441		
Perkins	1,365	Grand total	56,005

MONTANA.

BELL.—Extensive operations will be commenced as soon as the new shaft is connected with the old workings and ore can be hoisted in sufficient quantity to supply both furnaces at the smelter. Among other important improvements which will greatly facilitate the handling of ore, is a tramway running under the calcining furnace, connecting with an elevator and elevated tramway, by which the cars can be filled with ore from the furnaces and transported directly to the blast-furnaces. The calcining furnaces have been doing some extraordinary work during the past week, each furnace averaging ten and a half tons of ore per day, which was calcined down to less than five per cent sulphur. Twenty-one tons of ore are run through the single blast-furnace each day, which produces a daily matte output of about ten tons. At the mine, work on the new three-compartment shaft is steadily progressing. At the depth of 400 feet, a cross-cut will be run to a point beneath the old workings, with which connection will be made by an uprise. It is expected that this connection will be made within the next thirty days, when stoping will be commenced on the high-grade west vein, and from 40 to 60 tons per day hoisted, to supply both blasts of the smelter, the output of which will then be increased to from 20 to 30 tons of matte per day.

GRANITE MOUNTAIN.—One thousand tons of No. 1 ore have been shipped to St. Louis for reduction. The product of the mine is an ordinary sulphuret ore, containing some ruby and antimonial silver. It is stated by one of the owners that it is cheaper to ship to St. Louis than to Butte.

NEVADA.

The Pawling (N. Y.) Smelting and Mining Company is now erecting at Battle Mountain, Nev., a ten-ton galena plant from the Pacific Iron-Works, Rankin, Brayton & Co., San Francisco. This will open a new era for that portion of Nevada, as it has long been in need of proper reduction facilities. The whole business is under the charge of Mr. Frank Green, an old-time miner, who has had an extended experience.

ALBION.—According to the Eureka *Sentinel*, the tributers are taking out some good ore at the head of the cave. They have a vein about three feet wide, and and are working in open ground. On the fissure-drift, where a streak of ore was cut, ten feet of a winze has developed a three-foot vein still widening in depth, having maintained the width of three feet after the first foot sunk. This ore is of good grade. At the head of a cave to the north of the east uprise, a vein of good ore has been found by tributers. This also is opening out, and shows quantity and strength, and gives promise of continuing in exploration, this being new ground and on the line of the fissure. Under the June chamber, a drift has been run, developing a cave in which ore of good grade and quantity is found, and appearing to make as it pitches in depth.

ALEXANDER.—The company has men fitting up one of the hoisting-works. Operations at the mine will be resumed shortly.

BERRYMANN TUNNEL.—Work continues at this tunnel, Silverado Mountains, satisfactorily. Good progress is made.

EUREKA TUNNEL.—The engine shaft has reached a depth of 119 feet. At 105 feet it connects with the No. 3 drift on the first level. The No. 2 winze is connected with the South Addison chamber at the bottom. This chamber is 12 feet high, 16 feet wide, and 20 feet long. The ore is striking northerly. Four feet of this ore are very rich. Progress is made in uprising on the North Addison ore-body, which is also looking well. The carbonate seam is not looking as well as it did, yet the ore output has not decreased on account of this. In fact, since the connections mentioned above were made, the output has increased, and expenses have been lessened.

GOLDEN RULE.—Progress is made on this tunnel and the prospects are improving rapidly. A few days ago, a vein of quartz six inches thick was cut through.

OLD CHAMPION.—This mine, on Alhambra Hill, has been twice relocated, and will now be worked again. A tunnel will be started and run on the contact of the limestone and trachyte, from which a cross-cut will be driven in under the old workings upon the ledge. There is some good ore in sight.

NEW MEXICO.

The machinery for a four-stack smelter to be built by Gustave Billing has arrived and will be at once placed in position at Socorro. Mr. Billing is the owner of the Kelly mine, which contains a large body of carbonates.

A dispatch dated Santa Fé, May 22d, says that an armed mob of sixty men attacked the principal mine of the San Pedro and Cañon del Agua Company, in Santa Fé County, and drove off thirty men who were working the mine. The mine has been in litigation some time, and legal action will be taken to gain possession of it.

The new owners of the Cooney mine, in the Mogollon Mountains have, ordered of the Pacific Iron-Works, Rankin, Brayton & Co., San Francisco, a complete ten-stamp silver mill, which will be erected without delay, to work the rich ores of that property.

UTAH.

BEAVER COUNTY.

Reports from various mines show that the Stalwart, formerly the Ivanhoe, of the Garden City Company's group, has a fine showing of rich horn-silver at a depth of 180 feet. The Kanairah, in South Camp, Star District, over 200 feet perpendicular, has a fine showing of first-class smelting ores. The Monmouth and St. Mary's, two of the oldest claims in Star District, have developed large bodies of free smelting ores. The Dykes & Morehouse, in West Camp, has also a good showing of heavy silver-lead ores of a high grade, at a depth of 200 feet. The Creedmoor, South Camp, has a four-foot vein of rich galena ore. In North Star, the Lake Superior shows a very large body of copper ore, which runs from 20 to 60 per cent copper, and contains from 20 to 150 ounces silver per ton. This is at a depth of nearly 200 feet perpendicular. Star District also contains a number of claims which have immense deposits of low-grade silver-lead ores, which will run from 14 to 22 ounces silver, and from 12 to 25 per cent lead per ton. These ores can be hauled to Milford for $2 per ton or less, where plenty of water can be had for concentrating purposes. Machinery now at the latter place is lying idle that can be used for such purposes.

WASHINGTON COUNTY—SILVER REEF.

The mining industry, which is the creative feature with us, writes the Silver Reef correspondent of the Salt Lake *Tribune*, looks decidedly encouraging for the future. Some of the properties which have lain idle for a year or more have resumed, or are about to resume operations, and there is no doubt but that the latter half of the year will witness more mines in operation and more men employed in the district than at any time during the past three years.

WYOMING.

BULLION.—This mine, situated in Sweetwater County, has been sold in Salt Lake City to San Francisco parties for $60,000. The ledge has been stripped 150 feet in length and eighty feet wide, exposing a large body of free-milling gold ore, which assays favorably. A shaft thirty-two feet deep in the ore has a drift at the bottom extending thirty-six feet north, and the heading is still in ore. A sixty-stamp mill will be at once erected on the property by the purchasers.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, May 25.

The mining market has been quite active this week, and stronger prices have prevailed for the better class of stocks. The Comstocks show quite an improvement both in price and in dealings, closing strong to-day. Sonora Consolidated continues to be the most active stock on the market, and the reported transactions have been enormous. Another "short interest" has been developed in it, and this has sent the stock up to a strong figure. A summary of the market is given below. The total number of mining shares sold at all the Exchanges for the week aggregates 326,346, as against 237,700 last week.

The Comstock shares have been active and strong. California sold from 22@30c., with a business of 4500 shares. Consolidated Virginia has had a fair business at strong prices; it sold from 52@66@61c. Sierra Nevada was also strong, selling from $5.38@$6.63. Union Consolidated shows quite an improvement in price, under a fair business; it sold from $4.60@$6.50. Mexican was quiet and steady at $3.15@$3.50. Gould & Curry sold at $3@$3.25 under a small business. Hale & Norcross had a small business at strong prices; it sold from $4.50@$5.25. Best & Belcher sold at $4.50. Yellow Jacket was quiet at $4.25@$4. Sutro Tunnel was active and steady, selling from 20@22c., with a business of 18,400 shares. Consolidated Imperial sold at 10c., assessment paid, and at 4c., assessment unpaid.

The Leadville stocks were quiet and steady. Amie sold to the extent of 29,500 shares at 15@18c. Chrysolite was quiet and steady at $1.10@$1.15. Iron Silver had a fair business at steady prices; it sold from $3.10@$3. Leadville was strong under small transactions, and sold from 48@60c. Little Pittsburg was irregular at 85@75@80c. under a small business. Climax sold at 9c.

The Bodie stocks were also quiet and steady. Bodie had a small business at steady prices, selling from $1.20@$1.15. Standard was moderately dealt in and was a little strong; it sold from $6@$6.38. Bulwer sold at 50c. to-day.

The Tuscarora stocks have been a little weak under small transactions. Argenta sold from $1.20@$1.10, with a business of 300 shares. Belle Isle was quiet and steady at 25c. Navajo had a fair business and was weak; it sold from $1.95@$1.70. North Belle Isle sold at 23c., with one transaction. Independence sold at 32c. Elko Consolidated was quiet and steady, selling from 24@20c., assessment paid, and at 8c., assessment unpaid.

In the miscellaneous list, Alice was quiet and steady at $3. Bassick sold from $8.25@$8.13 under a small business. Eureka Consolidated was steady at $3@$3.25. Father de Smet sold from $4.50@$4.10. Green Mountain was quiet and weak at 81@75c. Rising Sun sold at 3c., and Cherokee at 3c. Homestake records a small business, and was a little weak; it sold from $16.25@$15.63. Horn-Silver had a fair business at irregular prices; it sold from $6.75@6.25@$6.63. Hukill sold at 7c. under a small business. Northern Belle was quiet and weak, selling from $6.75@$6. Robinson Consolidated had a small business at irregular prices; it sold from 86@81@83c. Sierra Grande has gained strength, under a moderate business, and has sold from $1.10@$1.45@$1.30.

Bradshaw was quiet at 33c. Central Arizona sold from 30@25c., under a business of 200 shares. Decatur was active and steady, selling from 5@6c. Eastern Oregon sold at 28c. Harlem had a small business and was strong, selling from $1.40@$1.55. Hortense sold at 12c. Lacrosse was moderately dealt in and was steady; it sold from 9@13@12c. Oriental & Miller records a small business at 15c. Rappahannock sold at 8@7c. Sonora Consolidated was very actively dealt in at strong prices; it sold from 47@70c., the transactions amounting to 182,214 shares. South Hite sold at 15c., and South Pacific at 6@7c.

Dispatches to the representatives of the Copper Prince report that this company has won its suit against the Copper Queen Company. The latter has made a motion for a new trial.

MEETINGS.

Amygdaloid Mining Company, office M. H. Hoffman, No. 629 Walnut street, Room 7, Philadelphia, Pa. Annual meeting of stockholders and election of trustees, June 6th, at twelve o'clock M.

Empire Copper Company, office M. H. Hoffman, No. 629 Walnut street, Room 7, Philadelphia, Pa. Annual meeting of stockholders and election of trustees, June 1st, at twelve o'clock M.

Old Dominion Copper Mining Company, No. 72 Broadway, New York City. The postponed annual meeting of stockholders, June 29th, at twelve o'clock M.

Philadelphia & Boston Mining Company, office M. H. Hoffman, 629 Walnut street, Room 7, Philadelphia, Pa. Annual meeting of stockholders and election of trustees, June 1st, at twelve o'clock M.

Quincy Mining Company, No. 4 Exchange Court, New York City. Annual meeting of stockholders and election of trustees, June 6th, at twelve o'clock M.

Sonora Consolidated Mill and Mining Company, No. 40 Broadway, Room 46, New York City. A meeting at which a full report of the financial condition of the company and the plans for the future will be discussed, May 29th, at one o'clock P.M.

Union Consolidated Mining Company, Astor House, New York City. Annual meeting of stockholders and election of trustees, June 4th, at twelve o'clock M.

Union Copper, Land and Mining Company, No. 3 Merchants' Exchange, State street, Boston, Mass. Meeting of stockholders, May 29th, at three o'clock P.M.

DIVIDENDS.

The Catalpa Mining Company has declared a dividend of ten cents per share, payable to stockholders of record June 1st.

The Charleston Mining and Manufacturing Company of South Carolina announces a quarterly dividend of two dollars and fifty cents per share, payable June 1st, at the office of the company, No. 132 Walnut street, Philadelphia, Pa.

The Crescent Mining Company, of Utah, has declared a dividend of ten cents per share, payable May 20th.

The Gem Mining Company, of Colorado, has declared a dividend (No. 14) of two per cent on its capital stock, payable to stockholders of record May 28th.

The Glen Mining Company, of Colorado, has declared a dividend (No. 7) of one per cent on its capital stock, payable to stockholders of record May 28th.

The Granite Silver Mining Company, of Colorado, has declared a dividend (No. 5) of one per cent on its capital stock, payable to stockholders of record May 28th.

The Iron Silver Mining Company, of Colorado, has declared dividend No. 11 of twenty cents per share, or $100,000, payable June 15th. The total amount of dividends to date, $1,100,000.

PIPE LINE CERTIFICATES.

The following table gives the quotations and sales at the New York Mining Stock and National Petroleum Exchange:

		Opening.	Highest.	Lowest.	Closing.	Sales.
May	19....	$1.03⅛	$1.03¼	$1.02⅝	$1.02⅝	1,230,000
	21....	1.03	1.03⅝	1.02½	1.03⅝	1,844,000
	22....	1.03⅝	1.04⅛	1.03½	1.03⅝	1,615,000
	23....	1.03¼	1.03¼	1.00⅝	1.00⅝	1,482,000

	25....	1.03⅝	1.04⅛	1.02½	1.03⅝	1,520,000
Total sales.						9,385,000

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, May 24.

There is no improvement to note in regard to the market for copper stocks. The sales of the past week have been few and far between, and prices are barely sustained. Lake ingot copper is quite firm at about 16 cents; but, unless an advance from this point is made, we do not anticipate any activity in the market. The sales of Calumet & Hecla have ranged from $234@$232½, the latter being to-day's price. Very little stock has changed hands, and there is no pressure to sell, holders generally being well contented with the liberal dividends which come along quarterly. Quincy is dull, but steady in price at $43, with a few shares sold at $43½. Osceola dropped to $20 on a sale of 150 shares; but small lots sold at $21. Pewabic declined from $5 (May 10th) to $3, which is, however, bid for it. The above comprises all the stocks dealt in during the week, and affords but little margin for comment.

In silver stocks, the principal feature was the spurt in Sullivan, of Maine, which advanced from $1¼@$2⅛, with a reaction to $1 1-16, closing, however, to day, with sales at $1⅛. The advance is attributed to the report of the discovery of a new and rich orebody, and also to the fact that shipments of ore to England are to be commenced at once, they having received and accepted an offer of $18 per ton net for the ore on hand, which is reported as 50 or 60 cargoes now on the dump. We give the rumor as we hear it; but we confess to but little faith in its truthfulness. It looks to us more like a stock operation, as we understand the stock is largely held by a few parties, who would be glad to dispose of their holdings to the public. Catalpa declined in the early dealings to 62½c., and advanced to 70c. The company has declared a dividend of 10 cents per share, payable June 15th. Crescent sold at 30c. Bonanza, 2 1-16c. San Pedro declined to 40c.

At the Mining Exchange, a fair amount of transactions is reported. Bowman Silver seems to be the most active stock at present, and steadily gains in price, advancing from 15@19c. Massachusetts & New Mexicois steady at 7@8c. Empire, firm at 22c. Massachusetts & New Mexico 6s advanced to $28.

3 P.M.—The market was as dull as ever this afternoon, without change of prices. Sullivan sold at $1⅞. Calumet & Hecla, $232½. Harshaw, 50c. Closing prices: Silver stocks: Catalpa, 67½@70c. Crescent, 25c. bid. Harshaw, $⅛@$⅝. Sullivan, $1¾@$1⅞. Silvet Islet, $3@$4. San Pedro, 35@40c. Copper stocks: Calumet & Hecla, $232@$232¼ asked. Franklin, $10 bid, $17 asked. Huron, $1⅝ asked. Osceola, $21 bid. Pewabic, $3 bid, $4 asked. Quincy, $44 bid, $45 asked.

BULLION MARKET.

NEW YORK, Friday Evening, May 25.

The London market has shown a little more strength the past week, and this, with a higher sterling rate, has advanced the price here ; but the week closes without any special indications.

DATE.	London	N. Y.	DATE.	London	N. Y.
	Pence.	Cents.		Pence.	Cents.
May 19	50 1-16	109⅝	May 23	50⅛	109⅝
21	50 1-16	109⅛	24.	50⅛	109⅝
22	50 1-16	109⅝	25.	50⅛	109⅝

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended May 25th, as compiled from various sources, amounted to $133,000, as against $149,000 reported for the previous week. The receipts from January 1st, 1883, to date are $5,118,713.53.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended May 19th	$48,395
Corresponding week last year	4,675,000
Since January 1st, 1883	5,546,137
Corresponding period last year	25,804,297

Imports.

Week ended May 19th	$110,382
Corresponding week last year	112,600
Since January 1st, 1883	6,652,408
Corresponding period last year	1,629,532

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible ; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy ; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.11 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 14⅛ per cent, to arrive at actual value.

MINES.	States.	Month of April.	Year from Jan. 1st, 1883.

Foreign Bank Statements.—The governors of the Bank of England, at their regular weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 4 per cent. During the week, the bank gained £273,000 bullion on balance, and the proportion of its reserve to its liabilities was raised from 32⅜ to 35⅛ per cent, against 42 7-16 per cent at this date last year. May 23d, the bank gained £19,000 bullion on balance. The weekly statement of the Bank of France shows gains of 3,300,000 francs gold, and 1,775,000 francs silver.

METALS.

NEW YORK, Friday Evening, May 25.

Copper.—To-day the first arrival of copper from the Lake are reported. As yet the quantities are small, and are probably sold. There is very little offering, and the market continues quite firm at 16c., though little is done at that figure. It appears that consumers are again beginning to turn their attention to other brands, and those of standard quality are firmly held. Outside brands are a little better, cheap lots having disappeared. We quote 14¼@15½c. for the range.

London cables a little lower, £62 f. o. b. for Chili Bars and £68 f. o. b. for Best Selected. Mail advices indicate that the reports of shipments of furnace material and ores from this side were made use of by bears to a considerable extent. The following statement of March imports and exports of copper and ores, etc., will prove of interest :

IMPORTS.

	March		9 months	
Quantities.	1883.	1882.	1883.	1882.
Ores ton	2,348	2,566	19,986	3,099
Pig and old, lbs.	14,794	29,613	273,596	643,078
Quantities.	EXPORTS.			
Ore, tons	318	10	2,561	659
Pig, etc, lbs	1,059,139	685	3,245,324	2,288,796
Values.				
Ore	$84,929	$550	$414,880	$50,485
Pig, etc	155,171	145	531,746	377,184

According to the Board of Trade returns, the imports and exports of copper for the first four months were :

	Jan. 1 to April 30.		
	1883.	1882.	1881.
Imports :	Tons.	Tons.	Tons.
Pure in pyrites	5,951	5,650	4,753
" precipitate	7,261	5,253	7,193
" ore	4,036	3,862	3,434
" regulus	2,830	2,910	1,216
Bars, cakes, etc.	1,667	10,136	9,594
	31,745	27,811	26,190
Exports :			
Raw (English)	5,954	3,308	5,694
Sheets	5,472	4,730	4,485
Yellow metal at 60 per cent	3,670	3,343	2,935
Brass at 70 per cent	1,066	999	988
	16,162	12,470	14,102
Foreign	3,072	3,915	3,099
	19,234	16,385	17,201

Lead.—Beyond the sale of about 400 tons of Common lead in lots at 4·40c., we have heard of no business, and the market continues dull, especially so for Refined lead.

From St. Louis, Messrs. John Wahl & Co. wire us as follows to-day :

There is no change of any description in our market. Business has been quiet and of a limited character, with quotations at 4·12½@4·15c. for Refined and 4·12½c. for Chemical lead.

From Chicago, Messrs. Everett & Post, telegraph us : There has been no change in the condition of our market. Sales aggregate 300 tons of Common and Refined, on the basis of 4·15@4·17c. here.

It is necessary to add to the above dispatches of our correspondents that railroad freights have been cut and are now 28 cents from Chicago, and 30 cents per 100 pounds from St. Louis.

Tin.—This metal has been weaker, with spot Straits quoted at 21·50c. Australian, 21·50@21¾c. ; and Billiton at 22c. London cables £96 at the close.

Spelter.—This metal continues dull, but tolerably firm, at 4·70@4·75c. here for Common Western.

Antimony.—We have no change to note.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, May 25.

The following are the British Board of Trade returns of exports to the United States for the first four months of the current year :

	1882.	1883.
Pig-iron	154,951	86,927
Old iron for re-manufacture	40,972	17,936
Steel unwrought	66,706	15,305
Tin plates	64,976	65,239
Hoops and sheets	8,874	8,885
Bar, angle, bolt, and rod	10,081	4,692
Railroad iron of all kinds	89,965	21,098

American Pig.—Yesterday and to-day there have been many rumors that the Allentown Iron Company has failed. So far as we can learn, the facts in the case are the following : A few days since, the directors of the Allentown Iron Company called a meeting of its shareholders, and placed before them a proposal to raise additional capital—$1,000,000, it is said. This did not meet with any favor, and the principal bondholder, Mr. J. Welsh, of Philadelphia, decided to foreclose and wind up the concern. We understand that the furnace property will be offered for sale. The company has been losing money steadily, and its plant, so far as the furnaces at the Allentown Iron-Works are concerned, is so antiquated that it can not compete, and can make money only when the demand exceeds the capacity of the other furnaces of the district. Four of the furnaces were built in 1846, 1853, and 1854, and are small. The only modern furnace, 17-foot bosh and 60 feet high, was put up in 1874. It is the only one likely to survive. It is likely that the furnaces will blow out at an early date, and as there is little stock of pig on hand, the closing out of the Allentown Company is likely to have rather a good effect.

The market continues dull. The Thomas Iron Company reports sales of 1000 tons of Nos. 1 and 2 Foundry at $20 and $22 respectively. There is still talk of a further decline, and ordinary brands are selling below $22 and $20. We quote $21@$22 for No. 1, and $19@$20 for No. 2. A sale of 3000 tons of Gray Forge at Hoboken at $19.25 is reported, but other sales have been made at much lower figures. We quote $17.50@$19 at tidewater. Nothing is doing in Bessemer pig, which is quoted $21@$22 at tidewater. Spiegeleisen is moving steadily at $31.50 @$32.50, for 20 per cent material.

Scotch Pig.—Business is dull. The arrivals are light, aggregating 800 tons, of which only a portion was sold to arrive. Freights continue firm, while the foreign markets are dull and a little lower. We quote, ex ship : Coltness, $24@$24.50 ; Glengarnock, $22@$22.50 ; Eglinton, $21@$21.50 ; Langloan, $23.50@$24 ; and Summerlee, $24@$24.50.

Steel Rails.—The Eastern mills are all well supplied with orders till the fall, and some of them are declining orders. Inquiries, chiefly for small lots, are quite numerous, and can be placed at $28 at mill.

Old Rails.—There is very little business to report. The market is dull and weak, with Ts nominally quoted $22.50@$23.

Scrap is very flat, No. 1 being quoted ex ship at $23.50@$24, with little demand.

Philadelphia. May 25.

Pig-Iron.—To-day's quotations for pig-iron are as follows: Standard No. 1, $22 ; No. 2, $20 ; Forge, $19@$20. The week's business has been trifling. Most of the foundry iron sold has been at 50 cents below these quotations. A great deal of ordinary Foundry has been offered, and unusual concessions have been made, but buyers decline to accept. Founders are short of stocks, and, notwithstanding low prices and concessions, decline to purchase except for present needs. This policy helps to maintain a large apparent surplus on the market. Buyers are apprehensive.

The Western situation is unimproved. Extremely low prices for pig-iron prevail there, and the effect is felt in the East. Forge iron is selling in a small way, at prices ranging from $17.50@$18.50, but the highest limits are very hard to reach. Car-load lots were bought this week under $18 at furnace. The standard makes seem to be held pretty firmly, but some buyers have even obtained concessions from quoted rates. Very little will be done until after June 1st in anticipating requirements, as the trade has not yet given up the hope of a compromise of some sort. Should affairs not take a favorable turn by that time, a good many furnaces, the number of which has been variously estimated, will blow out ; in fact, there is no other remedy for the situation.

Furnace Irons.—Very little business has been heard of in furnace irons. A small trade in Scotch has been kept up, and prices have declined 50 cents within a few days. English is dull. Bessemer would sell at $21.

Merchant Iron.—The local iron trade is without any special points. Manufacturers are taking in a good many orders, sufficient to cover present output, at 2·20c., and stores report a moderate demand in small lots at 2·25@2·30c. The purchase of iron is controlled

to a great extent by the opinions of the respective buyers as to the summer supply. Some few large consumers have placed requirements for sixty days; others are buying from two to four weeks ahead. There is, in general, a little more business going on.

Nails.—Nail-makers have sold for June and July deliveries in some cases. The retail trade is good, and small lots are going at from $3.15@$3.25. Large lots, up to car-load lots, are selling as low as $3. Stocks are moderate and prices well maintained.

In *Construction Iron*, very little that has not been said heretofore is to be added. Large orders are hard to get, and in the little business of that character that is on the market prices are badly demoralized. Angle iron is quoted nominally at 2·40c. Inferior iron has been sold at 2·25c. Channels and Beams, combination prices, 3·50c., less 12½ per cent. Plate iron can not be sold outside of small lots at 2·40c. Sheet and Flange unchanged.

Steel Rails are in active request. Two or three large orders have been placed at $38. A fair amount of business in a small way is coming to hand at $39@$41, according to weight of sections. Old material is without activity. Small shipments are offered at $23@$27. Scrap is weak at $23@$26.

Pittsburg. May 24.

Pig-Iron.—The situation in this city has changed for the worse, weak holders of pig-iron have taken fright, and large offers have been made at very low prices. Consumers decline to purchase beyond immediate requirements. Red-short and neutral iron have been offered at $17@$18; foundry iron, at $19@$21. A sale took place on Tuesday of a portion of the Marshall iron, and it is believed that all of the immense stock of 60,000 tons will find its way into the market in the course of a few months. The effect will be disastrous, especially if the anticipated strike should take place. Stocks are already very large, and nothing but a very general closing down will prevent further weakness; buyers of finished iron have taken alarm, and are endeavoring to cover future requirements at present rates, namely, 2c. For several days past, a large amount of business has come to hand. Consumers have been running very bare of stock since winter. Nails continue active and firm at $3@$3.25. Inquiries are in hand for summer deliveries. Bessemer pig is offered at $21.50. Discounts on gas and steam-pipe, 70 and 5; on boiler tubes, 55 and 5. On large orders there are heavier discounts. Oil-well casings, 50c. per foot. Tubing, 16c.

Merchant Steel is weak and dull. Consumers are carrying very light stocks. Steel rails are firm at $39@$40. Mills in this section are well supplied with business. Rail fastenings are 2·60c. for spikes; 2c. for splice bars; hexagon nuts, 3·35c.

Prices for Old Rails have declined from $26@$22.50; occasional transactions, 50 cents under. Crop ends are offered at 25c., but better prices are looked for. The general situation is favorable to manufacturing interests. Mail and telegraphic advices from Western iron centers show large supplies and moderate demand. A number of mills will probably continue in operation during the summer with non-union labor. At the present time, retail requirements are large. Steel for agricultural implements is in large supply, and buyers are waiting for a further decline. Steel mills at this point continue to work to full capacity, and will probably continue to do so through the summer.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, May 25.

Anthracite.

The trade has improved a little since our last, inquiries for season delivery becoming more numerous, and spot lots of stove coal are realizing better prices. On the whole, however, the situation continues to be exceedingly discouraging to middle-men, who often cut off their commission in order to retain their trade, while individual operators are shading prices a little more than usual, although the companies appear to be doing little in that way. It is urged that the latter have more than ever reasons to stand together firmly. The Western trade has fairly begun, though scarcity of vessels at Buffalo temporarily checks the movement.

Mr. John H. Jones, official accountant, has just published the following statement of the anthracite coal tonnage for March:

	April, 1883.	For year 1883.	For year 1882.	Difference.
Phila. & Reading RR.	578,518	2,055,060	1,778,745	I. 276,915
Lehigh Valley RR	*493,517	1,835,543	1,577,836	I. 257,708
Central RR. of N. J.	413,796	1,364,669	1,150,899	I. 213,771
Del., Lack. & W. RR.	392,778	1,410,798	1,222,952	I. 187,845
Del. & Hud. Canal Co.	†267,163	977,549	879,728	I. 97,821
Penna. RR.	219,792	735,688	627,685	I. 108,003
Penna. Coal Co.	119,991	418,888	368,363	I. 50,525
N. Y., L. E. & W. RR.	26,155	102,126	70,507	I. 31,659
Total	2,514,710	8,900,961	7,676,715	I. 1,224,247

* This amount includes the production of the mines of the State Line and Sullivan RR. Co., amounting to 5352 tons.

† In addition there were 39,615 tons transported from mines by D. & H. C. Co., during April, which is included in tonnage of other interests.

The stock of coal on hand at tide-water shipping points, April 30th, 1883, was 719,232 tons; on March 31st, 1883, 598,192 tons; increase, 121,040 tons.

Bituminous.

The trade is dull, and there is considerable talk of low offerings of coal. Rumors of low prices of Cumberland at Baltimore and of Clearfield at Philadelphia are numerous, and we have every reason to believe are not entirely without foundation. Current business is small, and strong efforts are made for what there is of it. There is a strike of the coal-heavers at Georgetown and a scarcity of vessels. It is stated, however, that there is an understanding among the shippers that no more than $1.50 will be paid to Boston. We quote Clearfield alongside at $4@$4.25; and Cumberland, $4.10@$4.35, according to quality.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended May 19th and year from January 1st:

TONS OF 2240 LBS.	1883. Week.	1883. Year.	1882. Week.	1882. Year.
Wyoming Region.				
D. & H. Canal Co.	101,767	1,305,546	81,678	1,127,125
D. L. & W. RR. Co.	108,665	1,630,458	96,488	1,443,673
Penna. Coal Co.	33,015	448,885	33,113	390,481
L. V. RR. Co.	45,880	396,232	44,401	379,689
P. & N. Y. RR. Co.	5,185	72,113	5,488	69,630
C. RR. of N. J.	52,853	875,232	52,330	797,267
Penna. Canal Co.	15,292	79,989	14,008	85,013
North & West Br. RR.	7,493	182,157	.....	.....
	370,180	4,990,612	327,506	4,293,808
Lehigh Region.				
L. V. RR. Co.	131,915	1,718,550	133,362	1,562,659
C. RR. of N. J.	52,092	800,479	45,713	718,090
S. H. & W. B. RR.	1,418	16,571	.....	15,000
	185,425	2,535,600	179,075	2,295,747
Schuylkill Region.				
P. & R. RR. Co.	177,409	2,380,922	158,408	2,173,570
Shamokin & Lykens Val.	30,557	483,020	25,858	396,432
	207,966	2,863,942	184,266	2,570,002
Sullivan Region.				
St Line & Sul. RR. Co.	1,369	22,588	790	19,047
Total	764,940	10,412,742	691,637	9,178,604
Increase	.....	1,234,138	.....	.....
Decrease	.....	.....	.....	.....

The above table does not include the amount of coal consumed and sold at the mines, which is about six per cent of the whole production.

Total same time in 1878.....5,121,427 tons
" " " " 1879.....8,632,714 "
" " " " 1880.....7,939,037 "
" " " " 1881.....9,322,027 "

The increase in shipments of Cumberland Coal over the Cumberland Branch and Cumberland & Pennsylvania railroads amounts to 167,384 tons, as compared with the corresponding period in 1882.

Belvidere-Delaware Railroad Report for the week ended May 19th:

	Week.	Year. 1883.	Year. 1882.
Coal for shipment at Coal Port (Trenton)	4,638	25,825	15,324
Coal for shipment at South Amboy	17,906	318,593	290,170
Coal for distribution	13,864	301,705	262,006
Coal for company's use	2,477	55,386	50,299
Total	38,885	701,509	617,808
Increase	.....	83,701	.....
Decrease	.....	.....	.....

The Production of Bituminous Coal for the week ended May 19th was as follows:
Tons of 2000 lbs., unless otherwise designated.

	Week. Tons.	Year. Tons.
Cumberland Region, Md.		
Tons of 2240 lbs.	53,655	784,841
Barclay Region, Pa.		
Barclay RR., tons of 2240 lbs.	6,421	130,397

KERL'S ASSAYER'S MANUAL
JUST READY.

The Assayer's Manual. An abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor of the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brannt, Graduate of the Royal Agricultural College of Eldena, Prussia. Edited by William H. Wahl, Ph.D., Secretary of the Franklin Institute, Philadelphia. Illustrated by 65 engravings. In one volume, 8vo, 301 pages. Price $5, by *mail, free of postage, to any address in the world.*

EXTRACT FROM THE PREFACE.

"In view of the well-known thoroughness and accuracy of Bruno Kerl's various metallurgical works, the preparation of the present edition of his abridged Manual of *Assaying* has been undertaken with the conviction that it would be doing a real service to English speaking students and teachers of the subject. Though presented in very condensed form, every method of importance will be found to have received notice, and its practical value duly estimated at its proper worth."

CONTENTS.—GENERAL DIVISION.—I. Mechanical Manipulations. II. Chemical Operations. III. Assay Furnaces. IV. Assay Vessels. V. Balances and Weights. VI. Tools and Implements. VII. Assay Reagents. SPECIAL DIVISION.—I. Lead. II. Copper. III. Silver. IV. Gold. V. Platinum. VI. Nickel. VII. Cobalt. VIII. Zinc. IX. Cadmium. X. Tin. XI. Bismuth. XII. Mercury. XIII. Antimony. XIV. Arsenic. XV. Uranium. XVI. Chromium. XVII. Manganese. XVIII. Sulphur. XIX. Fuels. APPENDIX.—A. Tabular Synopses. B. Lower Harz Working Assays. C. Schaffner's Assay of Zinc as modified by Brunnlechner. Index.

☞ The above, or any of our books, sent by mail, free of postage, at the publication price, to any address in the world.

☞ Our new and revised CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS—96 pages, 8vo—and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one, in any part of the world, who will furnish his address.

MR. ROBERT HUNT, for so many years Keeper of the Mining Records of Great Britain, has retired from the office which his long and intelligent services had made so efficient and reliable.

NICE is to have an international exhibition this year, to embrace manufactures, fine arts, and agriculture. We notice that in the different sections formed mining, metallurgy, engineering, chemistry, and electricity have an important part. We understand from Mr. LEONARD F. BECKWITH, of this city, who is president of the American committee, that the exhibition will open on the 1st of December, and close on the 1st of May, 1884, the latest date at which applications for admission will be received being fixed at July 15th.

THE substitution of rolls for stamps is gaining ground. As yet, the number of mills built in accordance with the new system is small, but it is a fact pointing to a rapid increase in the future that some of the most eminent designers of silver mills advocate rolls, some of them in spite of an earlier prejudice against them. The subject is one that until now has been discussed only in a narrower circle, but, unless we much mistake the "signs of the times," is bound at an early date to be forcibly brought to the attention of all mill-men. We trust that the movement, when it does gain in force and popularity, will not slip from the control of those who have closely studied the subject, as failures due to incompetent designs and applications would prejudice a cause which is certainly destined to effect much good.

THE conviction that an attempt would be made by the other Western iron manufacturers to localize the pending strike in the Pittsburg District proper, is given as the reason for the step taken by the Western Iron Association in abandoning its demand for a scaling-down of wages 10 per cent. To say that this action is a surprise to the trade, is expressing its feeling mildly. Full or even partial work by the majority of the mills during the summer means a glut of finished iron under which prices must sag down to a low level. It is difficult to see how any but the most favorably located works are going to do more than cover the cost of production, while the weaker mills will have to stop. Experience has proved over and over again that they will not do so until growing losses leave them no alternative. There is little hope that any agreement can be reached as to restriction, when the manufacturers can not even hold together in trying to enforce a reduction of wages corresponding to the decline in prices. A cure is possible only by the heroic means of cutting prices down to the lowest limit at once. The plan has worked quite well so far in the Eastern foundry pig trade. It has convinced those who wavered and hoped against hope, and has cleared the situation. In the finished iron trade, matters are in a similar state. There are not orders enough for all, and the sooner the weaker element is crowded into idleness the better for all concerned.

THE FUTURE OF COPPER.

The letter of our correspondent from Lake Superior, which we print elsewhere, deals frankly with a question which is now uppermost in the minds of all copper producers. Nothing can be gained by closing their eyes to the fact that production will be enormous this year, if it goes on at the present pace. Our correspondent, who has the best facilities for watching developments in his own district, does not look forward to a decrease in the output this year, but is of the opinion that we must expect an increase. Much, of course, depends upon what the Calumet & Hecla will do; but it seems to us that the only question is, whether or not the managers of this extraordinary mine see fit to keep their income at the present high rate by an increase in the output corresponding to the falling off in receipts by reason of the falling off in the price. With the recent additions to their plant, they will probably find no trouble in so doing. Turning from the Lake to the Western mines, a recent close investigation of their working capacity this year enables us to state that they will certainly do better than they did last year, so far as production is concerned. Arizona is good for at least twenty million pounds this year; and Montana, which last year made 9,500,000 pounds, is now turning out copper at the rate of 18,000,000 pounds per year from its smelting-works, not counting the ore which is shipped directly to England. Of the copper run into furnace products in the Butte District, fully 15,000,000 or 16,000,000 pounds will go abroad. Besides this, fully 10,000,000 pounds of Lake and 1,000,000 pounds of Arizona ingot and black copper are contracted for shipment, so that the foreign markets will take from us fully 26,000,000 pounds of copper in ingot and matte, and an unknown quantity, reported to be 6000 tons, of rich ore from the Anaconda, of Butte, which will swell the total to at least 30,000,000 pounds. This, it is true, reduces the supply here of the estimated production of 105,000,000 by 26,000,000, or to 79,000,000 pounds, to which must be added the very problematical stock. The latter is apt to seem bewilderingly large to the uninitiated; but it must be remembered that it means the whole product of the Lake District during the entire period that navigation is closed. The excess of the stock of Lake of one year over the other is really only the amount which is chargeable as surplus.

The questions which now face producers are, How much more copper must we send away? and who is to ship it? On the former point, it is impossible to make any thing but very rough guesses. It depends primarily upon how our home trade is going to develop. If the present dullness continues, it must be heavy, and it would be idle to deny that the prospects rather point in that direction. Prices of manufactured goods, it is true, are much "cut up," but it is too well known that low figures do not tempt buyers when trade is as dull as it is now. That they will ultimately lead to a very important increase in the number and variety of the uses of the metal, can not be denied, but such an expansion of the field of any article is necessarily slow. It may be therefore assumed that during the last half of the present year more ingot copper will have to go; and we come to the second point, Who is going to ship it? We believe that Arizona will have to contribute to a much greater extent than hitherto. Montana ships almost all of its product, being specially favored by the silver contents of its mattes. The Lake

Digitized by Google

producers have a market here that may be, and is, considerably encroached upon, notably by the best brands of Arizona copper, which is skillfully used by consumers as a lever to pull down the quotations of Lake. But there is a considerable quantity of Arizona copper which will not do for that purpose. It is excellent material, no doubt, but it can not be forced into the hands of a set of consumers who have been spoiled by the long use of metal of unrivaled quality. Abroad it would rank high, here it does not, and the surplus of it which our market will not take must go abroad. The poorer grades of Arizona copper must seek the English market, to which it has good access from Gulf ports directly. This may not be a pleasant prospect; but the facts render it probable, and the sooner producers understand this, the better for all concerned. How the English markets will bear up under such an additional load remains to be seen. Stocks there are low, comparatively speaking, and the drop in the prices during the past six months will force weak producers in all parts of the world to stop.

THE IRON SILVER MINE.

When mining investments are so generally declining, and mining as a legitimate industry is made to bear the blame of the failures and losses due to insane gambling and incompetent or dishonest management, it is refreshing to turn to examples which show what good mines are doing when prudently and honestly managed. The Ontario, the Homestake, and the Horn-Silver are familiar examples; but as an illustration not only of what a good mine can do when well managed, but of the effect of management upon the profits of a mine, the Iron Silver, of Leadville, Colo., is an extremely instructive example.

The Iron Silver mine, owned at that time by Messrs. STEVENS & LEITER, began shipping ore to St. Louis in 1876, under rates of freight which made it impossible to ship any thing of lower grade than 100 ounces. The mine, under the management of Mr. STEVENS, was very profitable, and in 1879 or 1880 had already paid about $400,000 in dividends, had paid for its improvements, and had about $170,000 in bank when the present company was incorporated, and the control in March, 1880, passed into the hands of Mr. GEORGE D. ROBERTS and his friends, and the management was placed by them in the hands of Mr. W. S. KEYES, then also managing the Chrysolite.

Under this management, in one year—until about April, 1881—the property paid no dividends, but expended the $170,000 surplus and ran in debt $30,000, and the mine was said to be exhausted.

Mr. STEVENS was then again placed in charge, and immediately cut down the extravagant expenditures that were ruining the company, paid off the debt, accumulated a reserve fund of $100,000, and began to pay dividends, which were continued as follows:

1881. May 2	$100,000	1881. Dec. 20	$100,000
June 8	100,000	1882. March	100,000
Aug. 15	100,000	June	100,000
Oct. 15	100,000		

In March, 1882, Mr. STEVENS was left out of the board and management, but in June, 1882, again resumed control, having bought out MR. LEITER'S large interest. At that time, it was stated that the mine would pay but one dividend more. The following record shows how far this gloomy prediction was from being realized:

1882. October	$100,000	1883. March	$100.000
December	100,000	June	100,000

Total dividends declared since the company was organized, $1,100,000 (previous to that, the mine had paid $400,000). And the company has in the treasury nearly enough for another dividend, besides the $100,000 reserve, which it always maintains. The mine is said to have reserves of ore "in sight" of about $2,000,000 market value, and the dumps are estimated to yield 8000 or 10,000 tons of ore of the present average value.

During ten months of 1882, the output of the mine was about 60,000 tons, which brought about $18 a ton, that left a net profit of between $6 and $7 a ton, after deducting operating expenses, real-estate purchases, law expenses, etc.

Under the present administration, the stock of this company has never been "speculative;" but, by the mere force of dividends, it has gradually crept up from about $1.60 to over $3 per share; and as the product of the mine and the net earnings are increasing, the present price will probably be exceeded.

The Iron Silver is a "low-grade" mine, and it is only the great reductions which have been secured in transportation rates and furnace charges that have made its immense supplies of low-grade ore available. The ore is also highly valued as a flux for drier ores, and commands a very high market price as compared with its intrinsic value.

The record of this mine and of its management is a highly creditable one, and may be studied with benefit by those who condemn mining for the shortcomings of extravagant or dishonest management, or who look upon all mining as merely gambling. This stock is paying the great majority of its present holders from 30 to 50 per cent per annum on their investment, has repaid them in dividends more than their original investment, and would net them to-day at market price nearly twice what they paid for it.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes. We do not hold ourselves responsible for the opinions of our correspondents.]

Plaster of Paris and Gypsum Works.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: How much are ground gypsum, as a fertilizer, and *first-class* plaster of Paris, worth per barrel, and is the market for the two articles comparatively active, especially in the Southern and Southwestern States? What machinery is necessary, and what is the cost of the same (say at St. Louis) to start operations? Will $10,000 be enough actual capital to get in working order, supposing the site to be very advantageous; plenty of water and timber on the property, the bed being from 10 to 20 feet thick, and lying horizontally? Underlying the gypsum, or immediately below it, are three feet of sandstone; then four feet of potter's clay; then six feet of white sand highly fit for making glass. How much is the sand worth per barrel, and what is the demand, provided it proves a first-class article? By an early reply, you will greatly oblige a constant reader of the JOURNAL. W. F. R.

JEANESVILLE, PA., May 23.

Not being familiar with details of the subjects to which our correspondent refers, we submit his questions to those of our readers who may be able to aid him.—EDITOR E. AND M. J.

A Suggestion to Miners of Pyrites.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: The letter of J. D., Jr., in your issue of the 5th inst., is likely to bring to the attention of acid manufacturers some very plain facts that have lain dormant during the past fourteen years. (Pyrites-kilns were erected and worked in this city about the year 1869.)

With the example set before us by the great majority of manufacturers in Europe, is it not inexplicable that during all these years some few of our own plants have not been adapted to the utilization of pyrites, with the attending profits as shown? May there not be some few errors of omission or commission in the easily flowing sentences, the startling tables, or some optical delusion in the careful drawings of "some other fellows' kilns"? We fail to catch the familiar odor that lingers constantly about the plant; but no doubt the "weekly return-sheet" will contain the usual clause, namely, "In cinders and unaccounted for, 7 per cent"! and the air will still look blue, and the pyrites miner, rolling in luxurious ease, will explain away satisfactorily the differences between analysis and working results.

This subject of changing established sulphur-burning plant for pyrites-kilns, with attendant difference in production of acid per cubic foot of chamber-space, is a matter of too serious import to be accepted without the most careful inquiry, and under the guidance of those disinterested in every respect. What is really needed at this time is a comparison of values of the pyrites found in this country, tabulated in such form as to be of service to those progressive manufacturers who have already spent much time and some money in looking up the subject. If, for instance, J. D., Jr., with his intimate knowledge of the various pyrites deposits, would invite the several owners of the mines to send full details of location, tide-water shipping-points, character of ores, gangue, percentage of sulphur, iron, copper, etc., and arrange such information for publication, in his usual forcible diction, he would confer a great favor on the community, and lay the manufacturers under still further obligations, already great, by reason of his able articles. Very truly, W. H. A.

We feel convinced that our correspondent, J. D., Jr., who is at present traveling in Mexico, will be happy to follow out the above suggestion, and we shall be much pleased to place in his hands, upon his return, any documents, samples, etc., relating to the pyrites mines in this country, sent to us to be transmitted to him. We join our correspondent W. H. A. in his appeal for information, and trust that the responses will be such as to warrant the publication of a detailed article by J. D., Jr.—EDITOR E. AND M. J.

American Pyrites for Sulphuric Acid Manufacture.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: I regret to say that Mr. H. J. Davis, of the Rowe pyrites mine, in your issue of May 19th makes some statements which can not remain uncontradicted. He denies my statement about the presence of a trace of arsenic in the Rowe pyrites. I made it on the authority of the chemist of the Cochrane Chemical Company, of this city, and I repeat that his careful examination of the Rowe ore gave traces of arsenic therein. He now adds that a recent test of acid made therefrom does not show even this trace.

The same is doubtless true of the Milan ore. For a long time, no trace of arsenic was noticed, as ordinary methods would not show it. Finally, the most delicate tests were applied and a mere trace was shown, "so small as to be utterly insignificant," as Mr. Attwood reported. It is a matter of congratulation that our American pyrites are evidently free from arsenic, as the fact removes the last barrier to their entire substitution for brimstone.

As to the presence of zinc in pyrites, my authority is Lunge, whose tables show that the German pyrites contained 6 per cent; the French, 2 per cent; the Belgian, 5 per cent; the Irish, 3½ per cent; the Swedish, 2½ per cent; and the Norwegian, 2 per cent. His volumes contain numerous incidental references to the presence of zinc in pyrites; and I submit that his authority is sufficient to bear out my casual reference to the point.

Thirdly, Mr. Davis objects to my statement that J. D. "points out a defect in the otherwise excellent ore from Rowe, namely, its softness." I did not pretend to quote his words, but to give their substance. J. D. stated, "It is granular in structure, and therefore in breaking makes a larger quantity of smalls than a more compact ore." If this is not an

Digitized by Google

exact equivalent of my phrase, "its softness," I fail to see the difference. To be more explicit, I will say that the Rowe ore crumbles under the process of breaking it into pieces fit for the kiln, so as to make an amount of fines variously estimated at from 15 to 20 per cent. I have seen carloads of it wherein no lump would remain after dropping it from the hand to the ground. It was all of the form of coarse gravel. The later deliveries are somewhat firmer; but deliveries recently, which I have seen, were still making 20 per cent of fines under the hammer. Moreover, this softness is disagreeably shown in the kilns by the clinkers formed therein, as I have seen them, both in the kilns and in the cinders drawn therefrom.

As I wrote you in the first place, I do not wish to depreciate other mines; but certain facts are beyond dispute. The Virginia pyrites, it seems, can be used only in shelf-burners; the Milan pyrites is the highest grade of ore to burn in ordinary kilns, as it never runs to scars, allows of a perfect draught, and makes the minimum of fines. The Rowe ore is between the two, and its use will oblige the acid-maker to have both kinds of burners in daily use.

In fact, I am ready to contract to ship No. 1 pyrites of from 48 per cent to 50 per cent sulphur, crushed to a uniform size ready for the kiln, and without any fines. When Mr. Davis can do the same, the buyer can put us on an equality.

The question of economy in burning these gravelly ores or fines in mechanical burners will doubtless be investigated by large manufacturers of acid. But it must be remembered that, if one intends now to put up a plant, he will have a great advantage in putting up ordinary kilns. Not only is the first cost much less, but he can buy and use all the foreign ores, as well as the hard pyrites like the Milan. The great Spanish mines really rule the market, and by building a plant suitable to burn their ores, the acid-maker is not dependent on any one or two American mines.

Respectfully yours, W. H. WHITMORE,
BOSTON, May 26. Treas. Milan Mining Co.

THE FUTURE OF COPPER.

Special Correspondence of the Engineering and Mining Journal.

The profitableness of mining copper, as of all other producing industries, depends upon the cost of production and the relative attitude assumed by supply and demand. If demand be the pressing mendicant, prices may run into excessive profits; but if supply be the pressing mendicant, prices are invariably at sea. In the first case, the only antidote is to limit demand, and in the second case to cut abruptly short the supply. In many industries, these antidotes are easily applied; but in respect to copper, either of them is easier prescribed than compounded, and in the present state of metallurgic statistics each is practically impossible. It is practically impossible to curtail demand, even if prices do run high; nor is it posible to curtail the supply, except by the smaller and more unprofitable companies going to the wall, when once the price lies prone and helpless. When, for example, the railroad boom of 1880 created a voracious demand for ingot for locomotive purposes and the like, it did not one whit take the edge off this appetite when copper sprang from 17 to 20 cents, making an increase of cost to consumers, over contracts of equal volume in 1879, of over two millions of money. Not only was there an active demand for our Lake brands, the output of which for this year 1880 eclipsed by nearly 7,000,000 pounds that of 1879, but the tide of our export trade shifted suddenly from 13,400,000 pounds in 1879 to less than one fortieth of that amount, while our import trade was increased from one million to nine and a half million pounds. And, on the other hand, no effort was made in 1878 to restrict the supply, although quotations for ingot fell off two cents per pound from the previous year, so that the increase of 2,600,000 pounds of lake copper netted something like half a million dollars less than the product of 1877. Our export trade for the same year, 1878, though increased by two million pounds, brought far less returns than the exports of 1879, although it ought in fairness to be said that at least a million and a half of the discrepancy was owing to the falling off in the foreign demand for American cartridges. This paragraph is written to furnish a key to the situation now existing, as we find ingot hanging fire at 16 cents, with markets any thing but buoyant, and twenty million pounds of refined copper awaiting shipment on the 1st of May at the smelting-docks of Portage Lake.

Although there can be no doubt that a combination of circumstances sometimes, somewhere, arises which will bring these conflicting interests to an equilibrium, for the nonce, at least, it must be acknowledged that the economic axiom, that demand regulates supply, finds in American copper mining an important modification. For while the market is undoubtedly glutted beyond all hopes of a speedy recovery, the mines are bracing themselves for eclipsing by excessive odds the records of past production. It may be rejoined that the ports of Europe swing open as those of America close on our producers; but the question whether we are prepared to undertake the mining of copper on an export basis is one which American capitalists have never yet undertaken, and it is quite likely are little prepared at present to study by the method of experiment. Up to this time, the great bulk of our ingot has found its way into the shops and foundries of American manufacturers, as will be seen by the following table:

Year.	Pounds produced.	Pounds export.
1877	39,000,000	11,500,000
1878	41,000,000	13,000,000
1879	43,000,000	13,400,000
1880	49,000,000	326,000
1881	54,000,000	7,000,000
1882	57,500,000	3,000,000

This table does not include the products obtained from Western ores, which would increase the supply for 1881 by 18,000,000 pounds, while the statistics of the Treasury Department point to only one million pounds as the total export; and an increase in 1882 to over 32,000,000 pounds, while the same authority quotes the exports of ore, matte, etc., at about 3,000,000 pounds. This would make the total product for 1882 to be 90,000,000 pounds, with the total exports only 6,000,000 pounds. We see in these figures that up to this time producers of copper have had their eyes on home and not foreign buyers. That so little copper found its way beyond seas is strong inferential proof, moreover, that a tremendous expansion has occurred in home demand, a matter which we find borne out by the facts. But yet a glance at the figures which illustrate the excessive growth of copper production will show the careful student and speculator that our American markets can not longer stand the tension of such burdens as are heaped upon them by the ambitious operators of the mines. And so we are confronted by a new question: Are we ready to try by experiment the problem of shifting the battle from home to foreign fields, where we come into competition with the pauper labor of Spanish-speaking people and the inexhaustible beds of Chili, Africa, Portugal, Spain, and Australia?

It is hardly probable that the general mining superintendent anticipated the drop in ingot which occurred in the middle of March, although a select few prophesied it from the time statistics from Boston and London first began to come to the surface at the beginning of the year 1883, which opened with lake and Western mines preparing to swell the total product of mineral altogether beyond precedent. We were certainly quite ready to do our part in the lodes of the Upper Peninsula. The Conglomerate was fast coming into shape to take its place among the first producers of Keneenaw; the Wolverine, which excited such a ripple of excitement during the early part of last summer, was nearly ready to set its well-equipped mill in operation; the battery of stamps at the Centennial were crushing out considerable mineral; a number of the old Ontonagon mines were reopening; and the Huron and other smaller Portage Lake mines were arranging for increased facilities for hoisting and treating their rock. The report of Mr. White, of the Quincy Company, for 1882, showed that the resources of that property opened up ready for stoping were fully equal to those of 1881, which was no less true of the Osceola and Franklin. There was every prospect that each of the dividend-paying mines would outdo its past record, excepting, perhaps, the veteran Central; but this mine, I am told this week, is showing much more stamp-rock in the bottom levels, though of the credibility of my information I am not just now sanguine. The Franklin was prepared to enter upon the most prosperous year of its history, and could it have found a market for its copper on hand, at ruling prices at the close of 1882, would have commenced the present year with the payment of a handsome dividend. The grim logic of events has exploded this pretty bubble, however, until a readjustment of the conflicting forces of the industry which now disturb its peace. The underground appearance of the mine is as promising as at any time in its history, and the product for April exceeded by thirty-six thousand tons the record of the same month in 1882. Michigan copper stocks, as a rule, are listed on their intrinsic merits; but the Franklin presents the anomalous front of very valuable property languishing among the weaker properties of this district. This state of affairs was owing, primarily, I fancy, to the old quarrel in its administrative circles, and, at present, to "hard times," coupled with memories of this imbroglio. Advices from the Montana and Arizona people exhibited them in readiness for "rushing things" also.

The first quarter of the year is over, and the prophecy concerning increased products is vindicated by the results. Almost all of the mines present figures in excess of last year. The published figures of the larger mines speak for themselves. The new Peninsula Mining Company comes to the front with an output varying from fifty to sixty tons of mineral monthly. The management of this property asserts that the returns meet expenses and more. It does not look for great results at present, nor even the best results, but will push steadily on until the capacity of the property has been gauged, when it will be equipped for extensive operations. The Conglomerate is still spending money freely and opening reserves for stoping as soon as the mill at Lac la Belle is ready for use. The Philadelphia people can rely that, under the superintendency of Mr. Alexander P. Thomas, all improvements will be the most substantial, even if they are not the most economical. The Wolverine arrangements for development of its well-charged lode are very complete, and, barring the one difficulty of water supply for milling purposes, which may or may not prove serious, the mine may now be said to be under headway. Your correspondent has it on quite credible though, in this instance, not authoritative testimony, that the Phœnix is again showing more and better stamp-rock, and that the Copper Falls is rushing its mill with more productive ground than at the close of the winter months. These last two, however, must not, because of this statement, be taken for more than they are worth, and are here referred to for the sole purpose of showing that all along the line the prospects of an increase in the output of our Michigan mines are unmistakable, provided, of course, prices are such that the mines can keep their noses above water. It ought here to be said that the old Kearsarge, adjoining the Wolverine, has been unwatered, and that explorations are going on under the direction, I am told, of Mr. John Daniell, superintendent of the Osceola and Tamarack mines. Copper has already been found in a percentage sufficient to warrant somewhat elaborate work, and although at present writing it does not exhibit so flattering an output as its neighbor, shafts will be sunk and a systematic development of the property begin. I have not space at present to take up in detail the Western mines. It may be safely said that, if the native and ore mines continue as they started out, the production of 1883 will exceed that of 1882 by little if any less than fifteen million pounds.

But here the question again arises, What is to be done with this tremendous amount of copper which is finding its way to the Eastern markets? That this is a significant question for our public-spirited capitalists who are engaged in the legitimate development of our mineral resources, is apparent from the first. We shall be helped in one way in studying the future of copper mining in Michigan and the West by giving heed to the following series of figures; while your correspondent does not profess for them infallibility, he is certain they are at least sufficiently reliable to be made the unmistakable basis of future operations. While it may be doubted if the home consumption of copper reached the enormous total of 55 million pounds for 1881, it is by no means likely

Digitized by Google

that it exceeded this sum, and it is safe to use this as the starting-point of our calculations. We have:

Lake brands, 1881	54,000,000	pounds.
Western " "	18,000,000	"
Left over from 1880	12,000,000	"
Total supply for 1881	84,000,000	"
Domestic consumption, 1881	55,000,000	pounds.
Export, 1881	8,000,000	"
	63,000,000	"
Carried over to 1882	21,000,000	"
Lake brands, 1882	57,000,000	pounds.
Western " "	32,500,000	"
Carried over from 1881	21,000,000	"
Total supply for 1882	111,000,000	"
Domestic consumption, 1882	63,000,000	pounds.
Exports, 1882	6,000,000	"
	69,000,000	"
Carried over to 1883	42,000,000	"
Total production, 1882	90,000,000	pounds.
Increase, 1883	15,000,000	"
Total production, 1883	105,000,000	"
Carried over from 1882	42,000,000	"
Total supply for 1883	147,000,000	"
Domestic consumption, 1883	72,000,000	"
Remainder	75,000,000	"

The only "imaginary quantity" in these figures is the amount of domestic consumption, and here your correspondent believes that any error is in favor of the miner, that is, the amount of consumption may have been magnified by a good part of a diameter. That the domestic consumption for 1883 should equal 72,000,000 pounds, will require the most prosperous activity among locomotive builders and electric light companies, as well as among the minor industries into which the use of copper enters.

That the figures presented in the preceding paragraph are formidable and pregnant with an eloquent if not ominous meaning to our generous speculators who have patiently paid the assessments levied upon them for the continuance of operations in lodes moderately charged with mineral, is true; but that there is an escape possible from the dilemma is possibly also true. Certainly none of our capitalists now thinks that domestic consumption has an appetite voracious enough to swallow the enormous product which, if things continue after the old order, must henceforth flow into the reservoir of the general market. Such a thing is impossible. Nor is there any prospect that any new industry, or the revival of any old one, will start up in the near future and demand the full record of our production. That also is impossible. To "bank" the output of the mines in hopes of a future outlet, at old-fashioned prices, in American avenues of trade, would only be to heap up wrath against a day of wrath. If we are going to produce, we must sell in order to have wherewithal to maintain production; and if production is to be maintained at its present volume, the gates must be lifted which open into foreign seas. What effect this new departure will have on American mining is food for digestion at another meal.

SPECULAR.

MINING AT TOMBSTONE, ARIZONA.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: The mining outlook for this camp is brighter this spring than it has been for a year past. There are fewer mourners around the saloons; the cow-boys and "rustlers" have sought more congenial regions, and pistol practice in the street has become comparatively rare. New buildings are going up on all sides, and the burnt district is to be immediately rebuilt.

This revival of industry and confidence is based largely upon the general promise of successful mining below the water-level upon the great vein of the Contention and Grand Central Hill. This problem has been debated for more than a year past, and there has been great doubt, and there still is with some, whether the ore, which above water is free-milling, will pay a profit to work when in its unoxidized condition below the water.

The Grand Central Company was the first to take the risk of the attempt to lower the water which stands in quantity just below the 600-foot level. A long trial of the pumps showed that this is no slight undertaking. The water flowed in almost as fast as it could be pumped out. To all appearance, it would seem to be a large body of water, filling cavernous spaces, tank-like, over an extended area. A few feet were gained, but the capacity of the Grand Central pumps was obviously insufficient. The Contention Company, holding the adjoining mine, has just now decided to assist in the effort to control the water, and Mr. White, one of the largest owners, has gone to San Francisco to order pumps and machinery of the largest size and capacity.

This event has helped more than any other to brighten the prospects of the camp; for all concur in the belief that the owners of these leading mines would not make such great outlays without good reason.

But, in addition to the mining, Tombstone offers many advantages as a place of residence. It is high and salubrious, free from the miasms of the valley of the San Pedro, and has a bountiful supply of pure granite mountain water, brought in iron pipes from the Huachucha Mountains, twenty miles away. The market is well supplied with fruits and vegetables from Sonora and California, while the gulf at Guaymas affords an abundance of oysters and fish.

Many of the outside claims are now producing small quantities of ore, which before were not worked, but held for sale at high figures.

On the Bob Ingersoll, the incline is pushed steadily downward into the Blue Monday claim, and will soon intersect the West Side lode. The ore in the bottom is found to be fully equal to, or better than, the ores taken out higher up. The Contact claim is said to look better than ever.

COPPER MINE LITIGATION.

An event of considerable interest and importance in mining jurisprudence is the suit of the Copper Prince Mining Company, of New York, *vs.* the Copper Queen Mining Company, of the same place. It is claimed by the Copper Prince people that they have a vein with its apex on the Prince claim; while the Copper Queen people claim that, if the ore-body in controversy is a vein, its apex is clearly within the lines of the Copper Queen claim. An extensive examination of the ground in dispute has been made by the experts on both sides, and numerous very interesting maps and sections have been drawn to illustrate and explain the points at issue and the position and formation of the ore. The trial of the case began on the 17th, and will probably not be closed before the 25th.

THE WAY UP CLAIM.

The celebrated case of the Tombstone Mill and Mining Company has not yet been decided on the appeal. Since the decision in favor of the Way Up, a year ago, the case has been carried to the Supreme Court of the territory, and has been argued; but no decision has been rendered, and the Way Up lies unworked, waiting the slow operation of the law.

TOMBSTONE MILL AND MINING COMPANY.

The operations of this company for the past year, ended April 1st, 1883, have recently been given in detail in the annual report to the stockholders, which you probably have seen and perhaps reprinted in part. From this document it apppears that the aggregate extraction from the two claims—the Good Enough and the Tough Nut—has been nearly 67,000 tons of ore, and that all the known ore-bodies have been exhausted. In consequence, work has been stopped on these claims and transferred chiefly to the nearly vertical veins which cross the claim in a general northerly and southerly direction, nearly parallel with the Contention and Grand Central lodes.

WEST SIDE LODE.

The most prominent of these veins at present is the West Side, which can be traced for at least 1300 feet, and is opened by a series of shafts for a distance of 1200 feet, and to a depth of 300 feet. Ore is found for most of the distance along this vein, and averages about 40 ounces in silver and half an ounce in gold. The ore-bodies are from two to ten feet, and it is said eighteen feet thick, but the vein in some places is very thin. It promises a large and continued supply of good milling ore.

Some work has been done on other and parallel veins with promising results.

The same company, under the direction of Professor Church, has engaged in smelting. At the time of the stoppage of the dividends, it was found that the company was some $400,000 in debt. The immense accumulation of tailings was relied on to cover this debt, and, according to the last report of the company, it seems probable that in time this debt, now in the form of six per cent bonds, to the extent of $361,000, will be extinguished.

It is claimed that the preliminary trials to work these tailings by smelting have been successful. The tailings are first concentrated, and the concentrates, with the addition of slimes, are molded into bricks and mixed in the charge with an ore of manganese as a flux. This manganese is obtained in quantity in the camp, and carries about ten per cent of silica and 25 ounces of silver. This ore constitutes about one half of the smelting charge, and costs to extract at the rate of $10.13 per ton. In twelve months, 1480 tons of concentrates were obtained from 10,417 tons of tailings, a ratio of about 1 to 7.

GOLD IN LOWER CALIFORNIA.

The latest excitement here is the reported discovery of a new El Dorado in Lower California, opposite Guaymas. So far as yet known, the gold placers are within a district 40 miles long by 20 miles wide. Companies are forming here and in Guaymas to go to these diggings, and every available craft at Guaymas is brought into service. The great drawback is probably want of water, not only for washing out the gold, but for drinking purposes. The mountains are known as Sierra Gigantea, and rise to over 5000 feet above the gulf.

GLÜCK AUF.

TOMBSTONE, ARIZ., May, 1883.

EXPERIMENTS IN THE KOEPE WINDING SYSTEM.

We have had occasion repeatedly to refer to the Koepe winding system, in which hoisting-drums are dispensed with, the rope being carried around a simple pulley to the sheaves, a cage being attached to each end, and the bottom of both being connected with a tail-rope. The weight of the rope is thus completely balanced, and the hoisting-engine has only to perform the steady, uniform work of lifting the load. This system is gaining ground rapidly in continental and English collieries, and merits a close study on the part of engineers in this country, especially where high speed is aimed at. The work of investigation will be much aided by the results of a series of experiments carried out by Herr Baumann, of Kohlscheid, Germany, recently printed in the *Zeitschrift für Berg-, Hütten- und Salinen-Wesen*. It is evident that hoisting is possible only when the friction caused by the loads on the two ends of the rope is greater than the weight of the net load to be lifted carried on one of the cages. With P equal to the weight of half of the total length of the rope plus the empty cage and cars, and Q equal to the weight P plus the load to be raised, we have the following equation, in which u denotes the amount of friction:

$$Q - P = u\,(Q + P) \text{ or}$$

$$u = \frac{Q - P}{Q + P}$$

In using the Koepe system, there must be no danger of the rope sliding on the sheave, even when the rope has been covered with grease. The friction must be great enough to cause the stoppage of sliding as soon as the force applied to bring it about ceases to act. In Herr Baumann's experiments, the sheave was kept from turning. The scale-pans at both ends of the rope were first uniformly loaded, and then constant additions were made to the weight in one of them until motion imparted to it was maintained.

In the first series, giving the friction of wire rope on oak wood, a drum was employed which had been in actual use for a number of years. New and old steel and iron ropes were tried. In running the ropes on leather the latter was placed flat and on edge, and with the experiments relating to wire rope and cast-iron, the rope was dripping with oil, and in one series the load was allowed to remain for periods varying between 24

Digitized by Google

hours and 144 hours. In all, as will be seen, 866 experiments were made. The following is a recapitulation of the results:

Diameter of wire rope. Millimeters.	Material of rope.	Diameter of sheave. Meters.	Material.	No. of experiments.	Mean of $u=$
18	Steel, old.	2·2	Oak.	14	0·303
16	"	4·4	"	79	0·258
18	"	4·4	"	66	0·215
20	Iron, new.	4·4	"	21	0·280
20	Iron, old.	4·4	"	80	0·246
32	"	4·4	"	32	0·197
Average, rope on oak					0·242
16	Steel, old.	3·2	Leather, flat.	37	0·277
18	"	3·2	"	46	0·244
20	Iron, new.	3·2	"	52	0·253
20	Iron, old.	3·2	"	20	0·230
32	"	3·2	"	52	0·234
Average, rope on leather					0·248
16	Steel, old.	3·2	Leather on edge.	19	0·281
18	"	3·2	"	14	0·287
20	Iron, new.	3·2	"	15	0·269
20	Iron, old.	3·2	"	24	0·228
32	"	3·2	"	17	0·248
Average, rope on leather, on edge					0·256
15	Iron, old.	1·6	Cast-iron.	99	0·227
21	"	1·6	"	50	0·259
26	Steel. old.	1·6	"	129	0·182
Average, rope on cast-iron					0·203

As was to be expected, the friction of the ropes is smallest on cast-iron, greater on wood, and greatest on leather. It appears that it is somewhat smaller in the case of steel ropes than of iron ropes, and u grows smaller as the diameter of the ropes and the load increase. This is probably due to the fact that thinner ropes are pressed into closer contact with the body they rest on, and that with smaller loads the stiffness of the wire ropes has a great influence. When the experiments were made in rapid sucession, the friction declined, while it increased after oiling and after pauses. This is attributed to the heating of the oil by sliding.
